Steam Turbines.—There are two basic types of steam turbines—*impulse* and *reaction*. In the impulse type the steam expands in stationary nozzles where the heat energy is converted to kinetic energy by virtue of the increase in velocity of the jet. The driving force is created by the impulse of the high velocity steam jet on the blades, similar to the action of a water wheel. In the reaction turbine the steam expands in the passages of the moving blades with a corresponding drop in pressure and increase in velocity. The reaction to the force required to accelerate the steam is the driving force on the blades. This is similar to the rocket effect of jet propulsion.

The characteristics of the two types of turbines are such that a greater change of energy occurs in a set of nozzles in an impulse turbine than in a blade row of a reaction turbine. Thus, impulse turbines are generally more compact than reaction turbines. All small turbines are of the impulse type, whereas large turbines may be either impulse or reaction, or a combination of both types. The combined turbine takes advantage of the fact that the impulse blades are more efficient at the high pressure, inlet end while the reaction blades are more efficient at the low-pressure end. In geared turbine drives the turbine is divided into two or sometimes three casings, which are actually separate turbines, through which the steam flows in series. This division of turbines reduces the load that any one reduction gear pinion must transmit. Also, the problems of thermal expansions and contractions are reduced by the smaller units.

Reversing turbines are required for direct or geared drives. The reversing turbine is a separate turbine mounted in the casing of the low-pressure turbine at the exhaust end. When the ship is going ahead the astern turbine runs idle opposite to its natural direction of rotation. The resulting drag on the ahead turbines is kept as small as possible by making the astern element compact without too much regard for its efficiency. When running astern the windage losses in the ahead turbines are considerable and the final power available for astern running is generally less than half the ahead power. However, this is generally sufficient. If for any reason full astern power is required from a turbine, the electric drive is advisable.

Reciprocating Steam Engine.—All modern reciprocating engines used for marine propulsion are of the multicylinder vertical inverted type. The primary difference in the various forms is one of valve action, that is, the manner in which the steam is controlled during the events of admission, expansion and exhaust. A secondary distinction relates to the different ways of arranging the cylinders and connecting the pistons to the crankshaft.

The *slide valve engine* is the most common type. The two-cylinder compound is used mainly in tugs with the triple expansion predominating in seagoing cargo vessels. The slide valve engine installed in Liberty ships has one slide valve per cylinder which controls admission and exhaust of steam at both top and bottom ends

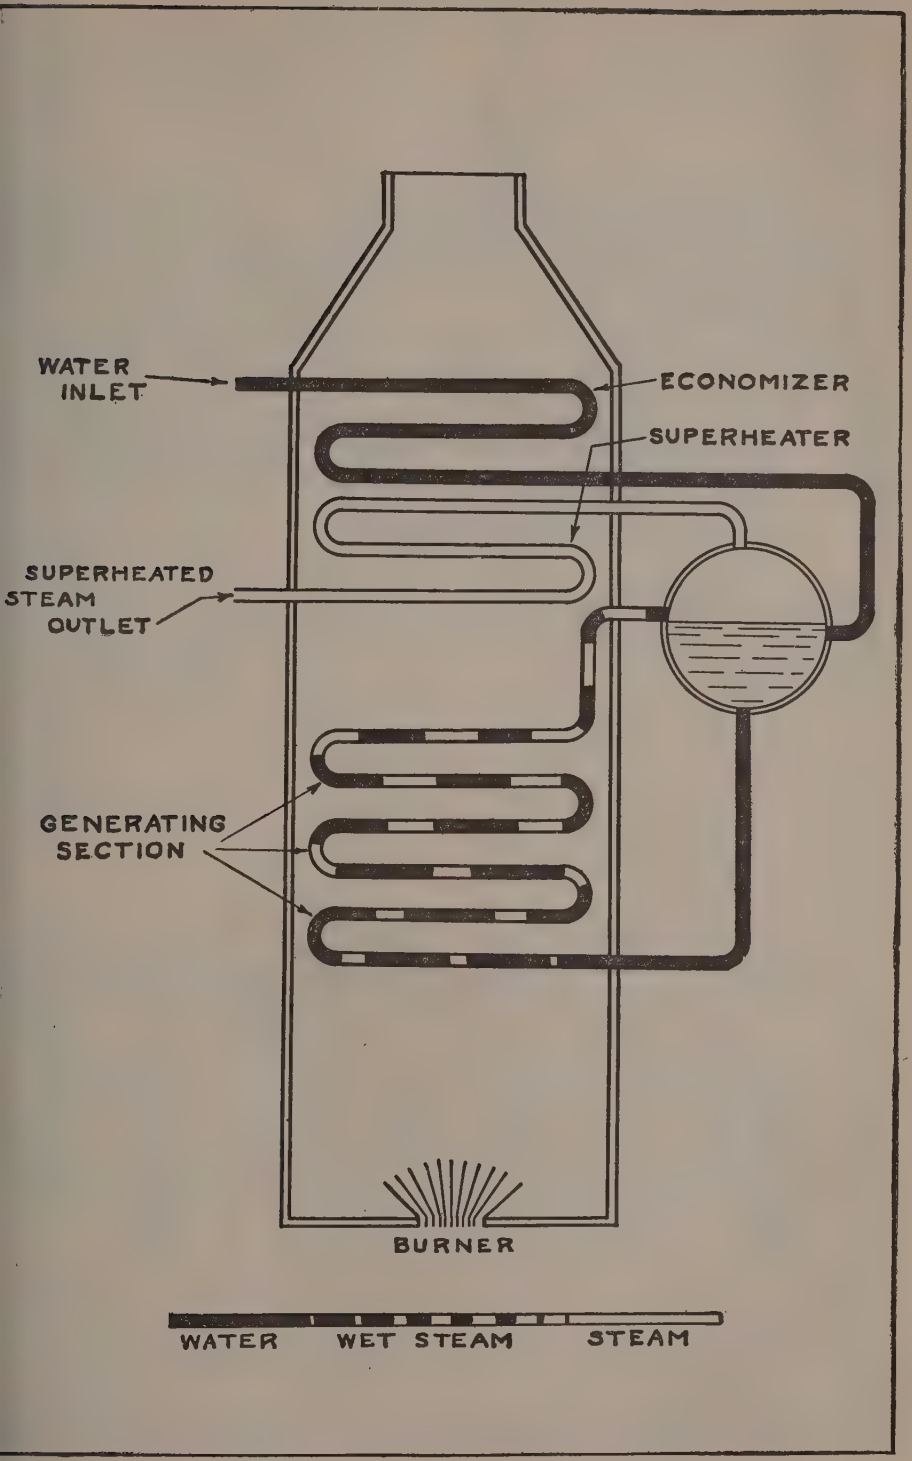

FIG. 9. Diagrammatic Representation of a Watertube Boiler.

Typical of all slide valve engines, it is simple and reliable but quite inefficient.

The *uniflow marine engine,* as built in the United States by the Skinner Engine Company, has a poppet valve at each end of the cylinder to control the admission of steam. The exhaust is controlled, as in all uniflow engines, by ports in the middle of the cylinder which are uncovered by the piston at the end of its stroke. The number of cylinders used ranges from 2 to 8. Each cylinder is independent in regard to steam flow; i.e., each cylinder receives a charge of steam at the beginning of the stroke and exhausts directly to the condenser. The poppet valves are operated by cams and can be controlled so as to give the much desired constant point of admission with variable cut-off.

Woolf Engine.—A development of the steam engine by Woolf in 1804 was a compound engine in which the high-pressure cylinder exhausted directly into the low-pressure cylinder. A recent revival of the Woolf principle occurs in the *Ajax engine.* The engine, as usually built, consists of 3 units on a 3-crank shaft. Each unit, is a steeple compound arrangement with the high-pressure cylinder on top of the low-pressure cylinder, both pistons being on the same rod. Each cylinder takes steam on one side of the piston only. The high-pressure takes steam on the bottom side and then on the down stroke exhausts directly to the top side of the low-pressure cylinder. The low-pressure cylinder is strictly single-acting uniflow and exhausts to a condenser attached to the side of the engine. One valve of the piston slide-valve type controls both admission to the high-pressure cylinder and the combined event of high-pressure exhaust and low-pressure admission.

The *Lentz engine* is a European development of the Woolf principle. It is built as a double compound engine having two high-pressure and two low-pressure cylinders. Each piston is on a separate crank with 180° crank angle between each high- and low-pressure cylinder. Thus the low-pressure cylinder of each unit is always moving opposite to its adjacent high-pressure cylinder. The steam to the double-acting pistons is controlled by poppet valves, six of which are required for each pair of cylinders. The only difference between the Lentz engine and an ordinary double-acting, poppet-valve counterflow is the manner in which the steam is exhausted directly from the high-pressure cylinder to the low-pressure instead of first being exhausted to a receiver and then being admitted to the low-pressure. This arrangement, however, gives a more efficient engine due to the elimination of the receiver and two valves between each pair of cylinders.

Reciprocating Engine Performance.—There is little difference in the relative heat efficiencies of the three engines just described; all of them are definitely superior to the standard slide valve engine. However, the attempt to increase the efficiency of any reciprocating engine by using higher-temperature steam aggravates the problem of lubricating the piston and cylinder walls. The serious aspect of the problem is not the actual providing of lubrication but the separation of the oil from the feedwater before it is returned to the boilers.

Warren Rotary Steam Engine.—Although this engine has no reciprocating parts, the driving torque is produced by direct steam pressure. The vanes on the rotor are virtually rotating pistons. Referring to Fig. 10 it will be noted that the steam is admitted from the center of the rotor to the spaces behind the vanes. By varying the opening of the port A any desired point of cut-off can be effected. Exhaust occurs when the vane uncovers the port "B." Steam is again admitted behind the vane when it has passed through the meshing space of the obturator. The cycle is similar to the uniflow engine with the compression event eliminated. The engine can be built with any desired number of stages having a total ratio of expansion greater than would be practicable in a reciprocating engine. The normal rotative speed of this type of engine is much less than that for a steam turbine. It can be coupled directly to electric generators and in case of a propulsion engine requires a geared speed reduction of only eight or ten to one for low propeller speeds and in many cases can be direct-connected. Although superheated steam can be used where high heat efficiency is desired, the engine is able to handle wet steam at the low-pressure end, and high ratios of expansion can be used without requiring highly superheated steam as in the case of a steam turbine. The chief advantage of this engine is the fact that it does not require internal lubrication and thus eliminates the problem of oil-contaminated feedwater which is common to all other pressure-type steam engines.

Combined Reciprocating Engines and Turbines.—Although some original designs have used reciprocating engines and turbines in combination, this arrangement is more common in conversion jobs where the power and efficiency of the propulsion plant have been increased by adding an exhaust turbine to the original reciprocating engine. The turbine must be connected through reduction gears to the propulsion shaft just aft of the main engine. In order to secure full benefit from the combination it is necessary to increase the original steam pressure and temperature and install a new condenser capable of producing a higher vacuum.

Diesel engines—of all general types are used aboard ship as either main engines or auxiliaries. For a more detailed discussion see INTERNAL COMBUSTION ENGINE; DIESEL ENGINE.

Thrust Bearing.—The interaction of the propeller and water produces a *thrust* on the propeller shaft. A special *thrust bearing* must be fitted in the shafting between the propeller and engine, or gears, so that this axial force which propels the vessel will be transmitted directly to the hull instead of to the propelling machinery. The modern type of thrust bearing consists of a collar on the shaft which bears against Babbitt-faced shoes secured to the casing of the bearing. The casing is bolted firmly to the hull. Since the shoes are on both the forward and after sides of the collar the propeller thrust will be transmitted to the hull whether going ahead or astern.

Propeller.—Although the form of a screw propeller is similar to the helicoidal screw thread, the action of an individual propeller blade can be considered as a rotating airfoil. The thrust produced by a marine propeller is directly comparable to the lift of an airplane wing. (See AERONAUTICS.) Propeller design is based on tests of scale models made either in open water or in closed variable pressure tunnels. In comparing the behavior of a model and the full size pro-

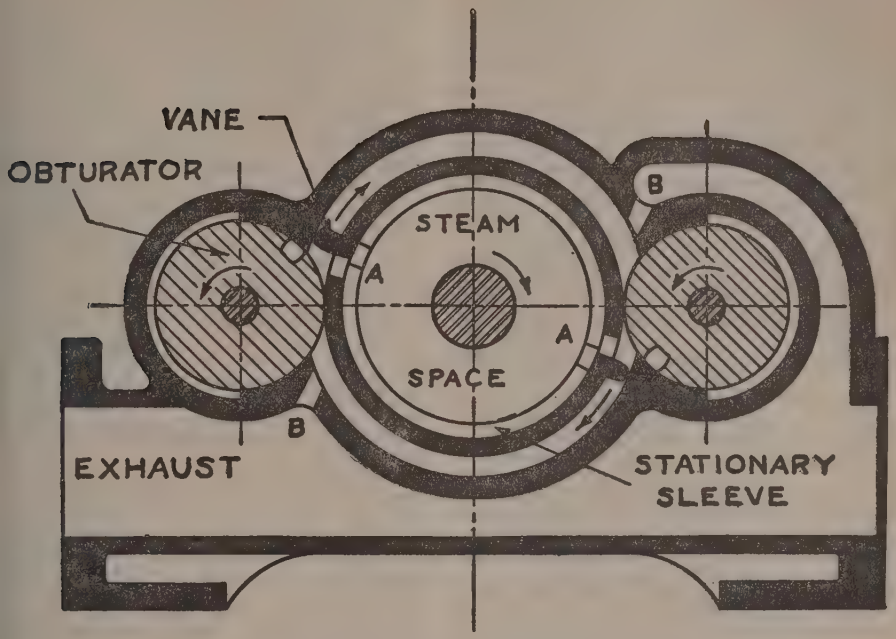

Fig. 10. Warren Rotary Steam Engine.

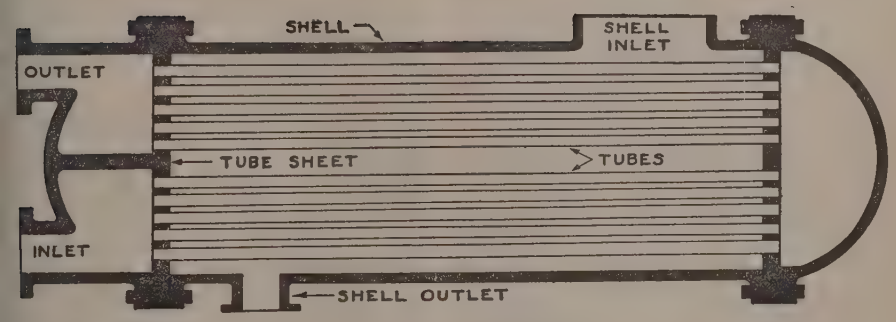

Fig. 11. Typical Heat Exchanger.

peller it is necessary to consider the effect of propeller size upon such quantities as thrust, power and torque. A study of dimensional analysis[1] reveals the conditions under which a model must be operated so that its performance can be used to predict full size performance. For instance, one of the conditions is that the ratio of the pressure acting on the model to the pressure acting on the full size must be the same as the ratio of their linear dimensions. That is, if the full size propeller has a diameter 20 times the diameter of the model, the pressure on the model must be one twentieth that on the full size. Since pressure acting on a ship's propeller is mainly atmospheric, it is necessary to operate the model in a partial vacuum to obtain comparable pressure conditions. Fortunately, this pressure relationship does not appreciably affect any of the propeller properties except cavitation (*cavitation* occurs when the flow of water to the propeller fails to follow the blade outline) and most testing can be conducted under atmospheric pressure.

Auxiliaries.—*Heat exchangers* include such items as condensers, evaporators, feedwater heaters, fuel oil heaters and lubricating oil coolers. Shell-and-tube construction, as illustrated in Fig. 11, is typical for all of these units. Of course, the shape, proportions and details of design will vary for each type of service, but all of them are based on the principle of transferring heat from one medium to another through the walls of the tubes. In the case of heat transfer between condensing steam and water more efficient transmission will be effected if the water is confined to the tubes so that the velocity of flow along the tube walls is uniform.

The *electric plant* aboard ship is becoming more important as the shipboard uses of electricity continue to expand. The first general use of electricity aboard ship at the beginning of the 20th century was confined to lighting. On small cargo vessels the "dynamo" would be shut down during the day and oil lamps would be used in the engine and fire rooms. On modern vessels electric power is as common as on shore with additional uses such as the gyrocompass, automatic steering and other navigational aids. In some vessels all auxiliaries and hull machinery are driven by electricity. Direct and alternating current are both used, with direct current predominating, except in later naval vessels. The electric generators for auxiliary use are generally driven by geared steam turbines or Diesel engines. Small size generators, particularly those in older ships where they are referred to as dynamos, are driven by single cylinder reciprocating steam engines.

Pumps.—The *pump* is probably the oldest piece of mechanical equipment in marine use. In the development of marine engineering many new types have been invented. The centrifugal and other rotary types are desirable on account of compactness, uniform flow and because they can be driven directly from the shaft of an electric motor or steam turbine. However, the reciprocating piston type pump driven by direct-acting steam pistons is still common. The efficiency of the piston pump is high, but the steam end of a direct-acting pump is very inefficient. The desirable features of the piston pump are retained in the *power pump* which gives an efficient drive by using a system of gears, crankshaft and connecting rod to connect an electric motor to the reciprocating pistons.

Fuels.—Oil is the supreme fuel for marine service. It is the only practicable fuel for internal combustion engines and is superior to coal for use in steam generators. For equal heat values the space required for oil is about 65 per cent of that required for coal. Also, oil can easily be stowed and removed, as required, from double bottoms and tanks located in remote parts of the ship, whereas coal must be bunkered reasonably close to the fireroom in space that is valuable for cargo or other purposes. Hand firing of coal requires considerable labor and is generally very inefficient. In the case of mechanical stokers and pulverized coal installations the labor involved will be about the same as that for oil burning, as far as the actual firing of the coal is concerned. However, there will be additional labor in trimming coal bunkers and feeding the hoppers of the pulverizers or stokers. In the matter of boiler design, oil firing imposes fewer restrictions on the size and shape of the boilers. This is a very important feature in the higher powered vessels.

For additional information on machinery used aboard ship see: ENGINE; PUMPS and PUMPING MACHINERY; STEAM ENGINE; TURBINE.

JEREMY B. BLOOD,
Professor of Marine Engineering, Webb Institute of Naval Architecture.

MARINE INSECTS. Insects have not only invaded rivers and lakes, they have established themselves to some extent at least, along the margin of the sea. On a sunny day by the shore myriads of flies may be seen hovering over the seaweed cast up by the tide. These have been developed from grubs which live and feed in the decaying weed, and are able to bear immersion twice daily. Around the rock-pools many midges may be noticed. Their grubs feed on growing green seaweed, and spend their whole life in the salt water, breathing the dissolved air, as do their fresh-water relations, by means of gill-filaments, or simply through the surface of the skin. Many species of beetles inhabit the shore, and are submerged twice daily, when they lurk under stones or burrow into the sand; the hairy bodies are not easily wetted, and in one of the best-known marine beetles (*Aëpus*) there are paired air sacs in the hind-body which are believed to act as reservoirs for breathing while the tide is up. Several kinds of very small springtails may be seen on the surface of the rock-pools at low tide; probably when the water rises they retire into crevices of the rocks. They are covered with a very fine, dense pile, and it seems impossible to wet them.

The absence of wings is a common character

[1] "Dimensional Analysis of Model Propeller Tests" by Edgar Buckingham, *Journal of the American Society of Naval Engineers,* vol. XLVIII, No. 2, May 1936.

mong the seashore insects. The beetles of the enus *Aëpus* are wingless, and so is the small ug *Aëpophilus* often found in their company, s well as the female of the midge *Clunio,* whose iate, though winged, appears not to fly, but to se his wings as sails as he skims over the sur- ice of the rock-pools. "The tendency of insects n oceanic isles to lose their wings has often een noticed," says G. H. Carpenter, "and the loss f the power of flight explained as an advantage, nce insects which do not fly cannot be blown ut to sea. Possibly the absence of wings in so any seashore insects can be explained in like anner. Several genera of pond skaters have ne or two species which frequent the water of stuaries and harbors; these are in all cases ingless, though their fresh-water relations are, s a rule, winged."

The extreme of adaptation to marine life is nown by the bugs of the genus *Halobates,* also elonging to the family Hydrometridae, with ieir short anchorlike forelegs and their im- ensely long and slender middle and hind-legs, ie middle shin and foot being fringed with ng hairs. The elongate wingless fore-body of iese insects and the greatly reduced hind-body ive them a most peculiar and characteristic ppearance, and the dense pile wherewith they re clothed keeps them dry. They have been bserved gliding over the calm seas of the opics, often hundreds of miles from land, or inging to drifting substances whence they could ick food.

MARINE INSURANCE. See INSURANCE, ARINE.

MARINE SEDIMENTS, those laid down the ocean, in contrast to terrestrial deposits id down on land. They are usually character- ed by uniformity in thickness and character er rather large areas, and commonly contain ssils of animals known to live only in the sea. he common types are conglomerates, sandstones, ales and limestones. See also OCEAN, THE; ction on *Submarine Geology* in article on EOLOGY, and section on *Sedimentary Rocks* in rticle on ROCKS.

MARINER'S COMPASS. See COMPASS, ARINER'S.

MARINES IN FRANCE IN 1918—Bel- au Wood, Soissons, etc.—On May 31, 1918, e Second Division of the American Expedition- y Forces was selected to go to the relief of the rench Army retreating before the German ive. The Fifth and Sixth Regiments and the ixth Machine Gun Battalion of United States arines, forming the Fourth Brigade of the Sec- nd Division, commanded by Brigadier General mes G. Harbord, were in reserve in a rest ea at Montdidier, when the order to the front rrived. Reaching their destination in the early orning of June 1, they moved into line in pport of the French. It was the opening of e Battle of Chateau Thierry, and found the erman advance facing the Americans. Hill 165 as the enemy's objective, but the marines as xpert riflemen "calmly set their sights and med with the same precision that they had own upon the rifle ranges at Paris Island, are Island and Quantico." Their machine guns so took up the fire.. The artillery soon backed the riflemen and, with shrapnel, added to the killing power; the Germans ran to cover raked by the American fire. This day's battle halted the German drive on Paris. But the city of Chateau Thierry remained in the enemy's hands; its liberation involved prior capture of the Bois de Belleau which was very strongly fortified, as were the flanking villages of Bouresches and Torcy. On June 6 at 5 P.M. the marines, attack- ing with the bayonet, captured Bouresches and penetrated Belleau Wood. The Germans resisted fanatically, but the marines with their associated infantry brigade so exhausted the three enemy divisions (197th, 237th and 10th) that the 5th Guards, and then the 28th, had to be thrown in as reinforcements. Thus, five German divisions were consumed in a three-week conflict. The last enemy nests were captured on the 28th. In the Aisne-Marne campaign launched on July 18 the brigade fought again brilliantly near Soissons, then in the St. Mihiel campaign of mid-Septem- ber. Early in October they defeated the Ger- mans once again east of Reims. The brigade's total casualties amounted to nearly 400 officers and 12,000 enlisted men. Distinguished Service crosses were awarded to 644 of its members.

MARINETTE, măr-ĭ-nĕt', city, Wisconsin, Marinette County seat, altitude 595 feet, is lo- cated on Green Bay, at the mouth of the Me- nominee River, on the Chicago and North West- ern and the Chicago, Milwaukee and St. Paul railroads, opposite Menominee, Mich., with which it has car ferry service across Lake Michigan to Frankfort, Mich. Its manufactures include wood products, excelsior, gloves, pulp wood insulation, cardboard boxes. It has docks for small craft on the river, which flows through the center of the city, and a harbor for lake steamers. The city has a considerable lake traffic, and is a point of entry for the 37th customs district. The site of the first local sawmill is preserved as a monu- ment to the city's early days, and there is a monument to United States Senator Isaac Stephenson (1829–1918), pioneer lumberman. Marinette was settled in 1830 on the site of an Indian village, was named for Queen Marinette (Jacobs) of the Menominee tribe, the wife of a fur trader, and received its city charter in 1887. Government is by mayor and council. Pop. (1950) 14,178.

MARINUS I or **MARTIN II,** pope: r. 882–884. Of Roman birth he was ordained a deacon and sent on three embassies to Constan- tinople at one of which he presided as legate over the Eighth Ecumenical Council (869). He suc- ceeded John VIII who had made him bishop of Caere (Cerveteri) and treasurer of the Holy See. He absolved Formosus (q.v.) of all cen- sures but condemned Photius (q.v.). Because of friendship for Alfred of England he freed the headquarters of the English in Rome from all taxes.

MARINUS II or **MARTIN III,** pope: r. 942–946. A Roman cardinal, he was elected through the power of the prince, Alberic, and in- stituted reforms, aided monastic development, and helped the poor. He was impotent as a temporal ruler.

MARIO, Giovanni Matteo, MAR- CHESE DI CANDIA, dē kän'dyä, Italian tenor: b.

Cagliari, Sardinia, Oct. 17, 1810; d. Rome, Dec. 11, 1883. After serving in the Sardinian Army he went to Paris, where after two years of musical study he was appointed first tenor of the opera, changing his name at the same time from Di Candia to Mario. He made his debut Nov. 30, 1838 as Robert in *Robert the Devil,* and soon became the leading tenor of the world. Among his chief roles were Otello in Rossini's *Otello;* Almaviva in *Il Barbiere di Siviglia;* and Manrico in *Il Trovatore.* He married the famous singer, Giulia Grisi, in 1854, and together they made an operatic tour of the United States. In his later years, after his retirement from the stage in 1867, he lost his fortune through speculations, and in 1872 again made a concert tour of the United States.

MARIOLATRY. See Mary.

MARION, măr'ĭ-ŏn, **Francis,** American soldier: b. near Georgetown, S. C., in 1732; d. Pond Bluff, Feb. 26, 1795. He was the youngest in a family of six children. His grandfather, Benjamin Marion, was a Huguenot exiled from France in 1690. At 16 Francis showed his adventurous disposition by embarking on a small vessel bound for the West Indies. It was wrecked and he barely escaped death by starvation. He returned home and worked several years on a farm. In 1759–1761 he served in campaigns against the Cherokees. Thenceforth until 1775 he lived on his plantation at Pond Bluff in the parish of Saint John.

In 1775 Marion was elected member from Saint John in the South Carolina provincial congress, which adopted the bill of rights and voted money for raising troops. He was chosen captain (June 21, 1775) and took the field against the British and the Tories. He took part in the capture of Fort Johnson (Sept. 14, 1775), and because of his ability in organizing and discipline was promoted to major. He participated in the patriot victory (June 28, 1776) at Charleston, which gave the Southern States respite from active fighting for nearly three years. Appointed lieutenant-colonel, he led his regiment in the unsuccessful attack on Savannah (September 1779). In 1780 Marion, now a brigadier-general, was obliged to take refuge in forest and swamp. Beginning with a handful of men, less than 20, he gathered recruits, fearless riders and good marksmen, who formed the famed "Marion's brigade." At times they numbered several hundred. They came and went at their leader's bidding, providing their own equipment and rations. Part of the time they were at work on their farms, planting crops. These rough and ready troopers became the terror of the British regulars and the Tories, although in justice to Marion's men it should be said that they committed no acts of wanton cruelty and burned no buildings on Tory homesteads. The stories of his adventures read more like fiction than history. His scouts kept close watch of the enemy's movements, and detachments of the brigade struck blow after blow, surprising and capturing small parties of soldiers. At times they united with larger bodies of troops for important engagements. After a vain pursuit, Sir Banastre Tarleton named Marion the "Swamp Fox." Failing in his attempt against Georgetown (December 1780), he retired to Swan Island and prepared for a second attack (Jan. 13, 1781), which was also unsuccessful. Then he joined with Col. Henry Lee in reducing Fort Watson (April 1781). After raiding 200 miles of country he commanded the first line in the battle of Eutaw Springs and took many prisoners. For his gallantry in this engagement he received the thanks of Congress. From 1782 to 1790 Marion served in the State senate and was a member of the State Constitutional Convention in 1790. He opposed harsh treatment of the Tories and condemned the Confiscation Act of 1782. In 1784 he married a wealthy cousin, Mary Videau, who survived him with no children. He was a man of attractive personality. Of slight figure, he was capable of great endurance and accustomed to abstinence. As a leader he was admired and beloved. He justly ranks among the heroes of the American Revolution.

MARION, city, Illinois, Williamson County seat, altitude 419 feet, is located 45 miles south of Mt. Vernon, on the Illinois Central; Missouri Pacific; and Chicago and Eastern Illinois railroads. It has local and county airports. To the west is Crab Orchard Lake (25,000 acres) a federal project, a large industrial area, and national wild life refuge. A United States Veterans Hospital adjoins the city. Blasting powder, mine drills, batteries, stencil machines, electric capacitors, armatures, transformers, refrigerator parts, plastics, furniture, ice cream, and ice vending machines are manufactured. Robert G. Ingersoll and John A. Logan (qq.v.) lived in Marion. Pop. (1950) 10,459.

MARION, city, Indiana, Grant County seat, altitude 811 feet, is located 28 miles northwest of Muncie, on the Pennsylvania; Chesapeake and Ohio; New York Central; and Toledo, St. Louis and Western railroads. It has an accredited airport. It is an industrial city in a farm area, with gas and oil wells nearby. Among its manufactures are insulated wires and cables, bottles, radios and equipment, automobile accessories, shoes, and paper products. The city government is administered by a mayor, a council, and a board of public works. It is the seat of Marion College (coeducational). The first land entry in Marion was made in 1825. Grant County, organized in 1831, was incorporated in 1839. The city was incorporated in 1889. It was named in honor of Gen. Francis Marion (q.v.). Pop. (1950) 30,081.

MARION, city, Iowa, Linn County, altitude 848 feet; is located on Indian Creek; 6 miles northeast of Cedar Rapids; on the Chicago, Milwaukee, St. Paul and Pacific Railroad, of which it is a division point, with shops and yards. It is in a region producing general crops, cattle and hogs. Its fine shade trees have won for it the nickname of Grove City. Marion was once the county seat; Cedar Rapids now holds that position. A mill built in 1863 is still operating, and there are in the city chick hatcheries, an aluminum factory, and a factory making sack balers. Marion was settled in 1839, and was named in honor of Gen. Francis Marion. Pop. (1950) 5,916.

MARION, city, Ohio, and Marion County seat; altitude 986 feet; 46 miles north of Columbus; on the Erie; Cleveland, Cincinnati, Chicago, and St. Louis; and Chesapeake and Ohio

ailroads; with a municipal airport. In a farm egion it is a railroad and manufacturing center, amous since 1874 for its steam shovels, tractors, oad rollers, and farm implements. Railroad hops, foundries, and factories making steel aults, steel bodies, locks, ornamental glass, silk oods, dresses, cigars, dairy and soybean prodcts are here.

At the age of 19, Warren G. Harding (q.v.) ecame proprietor of the Marion *Star*. The ouse in which he campaigned for the presidency 1 1920 is preserved as Harding Museum; and a ile south is the handsome Harding Memorial.

An early settler, Jacob Foos, found a fine ater supply at this site. After two years as acob's Well, the place was named Marion in 822 and became county seat. Marion became city in 1890. Pop. (1950) 33,817.

MARION, town, South Carolina, and larion County seat; altitude 68 feet; 21 miles ast of Florence; on the Atlantic Coast Line ailroad. It is the business center for a cotton, bacco, and timber region; local industries proice cotton yarn, cottonseed oil, veneer, boxes, ment blocks, clothing, lumber, and brick.

Marion was settled in 1800 as Gilesboro; in 30 it was renamed Marion, honoring Francis arion, the "Swamp Fox" of the American evolution. It was incorporated as a city in 00. Pop. (1940) 5,746; (1950) 6,834.

MARION, town, Virginia, and Smyth County at; altitude 2,124 feet; in the Walker Mouns; on Holston River; 45 miles northeast of istol; on the Norfolk and Western Railroad. is in a cattle, corn, Burley tobacco, and lumber gion, with limestone and manganese deposits. arion has manufactures of furniture and tool ndles, baseball bats, brick, shirts and shorts, d silk hosiery.

Here are Marion College, a junior college for ls, and the Southwestern State Hospital for e insane. The hero of King's Mountain, Gen. illiam Campbell (q.v.), is buried here. Sherod Anderson is also buried here. His son, bert Anderson, is the editor of Marion's ekly paper.

First settled in 1750, Marion became a town 1832. Three miles north is Hungry Mother ate Park. Pop. (1950) 7,000.

MARION ISLAND, in the Indian Ocean, a dependency of the Union of South Africa. is 13 miles long and 8 miles wide.

MARIOTTE, mȧ-ryôt', **Edme,** French ysicist: b. probably in Dijon, ?1620; d. Paris, ance, May 12, 1684. He lived for the most rt at Dijon, and was made prior of Saintrtin-sous-Beaune. He became a member of Academy of Sciences upon its formation, and s one of the founders of experimental physics. is Mariotte," said Marie Jean de Caritat larquis de Condorcet), "who first in France roduced into physics a spirit of observation l of doubt." He discovered independently the known by his name, also discovered by bert Boyle (q.v.), and known as Boyle's Law.

MARIOTTE'S LAW, *in physics,* the prinle that the volume of a gas, under constant, t is, unchanging, temperature and pressure, ies inversely as the pressure. It is identical with Boyle's Law (q.v.), the latter name being applied to it in the United States and England, and the former in continental Europe.

MARIPOSA GROVE, a stand of big trees in Yosemite National Park, California. It contains about 465 trees of the *Sequoia gigantea,* some of which are thousands of years old. One of the largest specimens is the Grizzly Giant, with a main limb over six feet in diameter at 200 feet above the earth and a circumference of 96 feet. The tallest tree is 272 feet high, and several are over 250 feet. A roadway 9½ feet wide has been cut through the heart of one of the giants.

MARIPOSA LILY or **BUTTERFLY LILY,** popular names for various species of *Calochortus* of the family Liliaceae. The numerous species, all of which are natives of western United States and British Columbia, are characterized by coated corms; rather leafy, generally branched stems; and showy, six-segmented flowers. Almost all the species are in cultivation for ornament, some, natives of the Colorado Desert, being suited to arid conditions, others to fairly moist soils, still others to very cold localities, as species indigenous to the Sierra Nevada. All will stand extreme cold, but not alternate freezing and thawing, hence their failure under such conditions. The bulbs should be planted in late autumn in any kind of soil. After the tops have become yellow subsequent to flowering in the following year the bulbs should be taken up, divided, and kept dry until planting time.

MARIQUINA, mä-rê-kē'nä, town, Philippine Islands in the province of Rizal, Luzon, eight miles northeast of Manila. It is situated at the intersection of several main highways, has shoe and leather factories and medicinal iron springs. Pop. (1948) 23,353.

MARIS, mä'rĭs, **Jacob,** Dutch painter: b. The Hague, Aug. 25, 1837; d. Carlsbad, Austria, (now Czechoslovakia) Oct. 7, 1899. He began his art studies at the local academy, choosing landscape as a specialty. He studied also under Nicaise de Keyser, director of the Antwerp Academy. Going to Paris, he received instruction from Antoine Auguste Hébert; he came under the influence of the Barbizon school, and reached his full power as a painter of figures and landscape in combination. In 1871 he returned to his native town. His brush work and use of chiaroscuro are essentially French.

Among his numerous works are *View of a Town in Holland; View of Schiedam; On the Sea Shore; Mother and Children.*

MARIS, mä'rĭs, **Matthijs,** Dutch painter, brother of Jacob Maris (q.v.): b. The Hague, Holland, Aug. 17, 1839; d. London, England, Aug. 22, 1917. In his youth he traveled and worked with his elder brother; in 1855 they lived in Antwerp sharing quarters with a young student named Lawrence Alma-Tadema (q.v.); in 1860 the brothers studied and sketched in Germany and Switzerland; in 1870, in Paris, Matthijs was enrolled in the National Guard and performed military service during the siege. Shortly after he settled in London, where he remained till his death. He was a striking example of the so-called "artistic temperament"; he

painted what he liked and when he liked, with the result that his works are extremely scarce. His work is characterized by fine qualities of color and imagination. At sales his pictures brought very high prices; two of them fetched $33,075 in London in 1906; one produced $17,850.

Willem Maris, a younger brother, was also a painter of note (b. The Hague, Feb. 18, 1844; d. Amsterdam, Oct. 11, 1910). He received his training from his brothers and was the most truly Dutch in his artistic sympathies. A sunny optimism pervades his work, expressed in wide skies, brilliant sunshine and gay coloring.

MARITAIN, mȧ-rē-tăn′, **Jacques,** French philosopher: b. Paris, Nov. 18, 1882. Baptized in the Protestant faith, he first came, when a student at the Sorbonne, under the influence of the professor of biology, Félix Alexandre Le Dantec, and then was weaned away from determinism and crass materialism by the philosopher Henri Bergson. He became a Catholic in 1906, and, after one year at Heidelberg, gave himself to the study of Thomistic philosophy. He was professor of philosophy at the Institut Catholique, Paris, visiting professor at the Institute of Medieval Studies, Toronto and at several American universities. He was in the United States at the outbreak of World War II and was one of the first French abroad to join the de Gaulle movement, which paved the way for his appointment in 1945 as French ambassador to the Vatican. His books are devoted to a technical exposition of scholastic philosophy in its Thomistic form, and to an application of Thomistic principles to politics, art, education and religion.

His first work, *La Philosophie bergsonnienne* (1914), was a criticism of Henri Bergson's theory of intellectual intuition; in *Reflexions sur l'intelligence et sa vie propre* (1924), he challenged Maurice Blondel's apparent distrust of abstraction and speculation; in *Three Reformers: Luther, Descartes, Rousseau* (tr. 1929), he denounced the fountainhead of modern subjectivism. *The Degrees of Knowledge* (tr. 1937), which may be considered his main work, contrasts the modern mathematical approach to the study of nature with the ancient metaphysical approach. His *Preface to Metaphysics* (tr. 1939), comprises lectures on being and its transcendental properties viewed as the basic principle of speculative thinking. What may be called his political treatises—*Things that are not Caesar's* (tr. 1930), *Freedom in the Modern World* (tr. 1936), *True Humanism* (1938), to mention but a few —are inspired by the preoccupation of safeguarding the dignity and rights of man against the encroachments of the modern totalitarian conception of the state and breathe a fervent democratic spirit, while *Art and Scholasticism* (tr. 1930), *Prayer and Intelligence* (1928), and *Religion and Culture* (1930) as well as *Education at the Cross-Roads* (1943), are typical of the manner in which the author translates into life and action the fundamental tenets of his philosophy. *Ransoming the Time* (tr. 1941), a collection of diverse essays, deals with one essential theme: the reconciliation of human conflicts through Christian wisdom.

MARITIME ADMINISTRATION. See Commerce, Department of.

MARITIME LAW. Broadly speaking, the subject matter of any action over which Admiralty Court could take jurisdiction shou be considered a topic of the Maritime Law. this definition prize cases would be include but the right of capture and other belligere rights on the high seas in time of war, the i munities of neutral shipping and cargoes, co traband traffic, etc., more properly consider are topics of International Law (q.v.). Ho ever, overseas commerce being internatio there is little in the *lex maritima* which has n an international aspect. The maritime law Great Britain and the United States is rooted the usages and customs of merchant seafare shipmasters and seamen, which are of remo antiquity and have been preserved in the Co and Digest of Justinian and other compilatio hereafter mentioned. The oldest repository England of this law was the *Black Book the Admiralty,* written in Norman French a dating partly from the reigns of Edward and Richard II and partly from the reigns Henry IV, Henry V and Henry VI, "long fore any controversies arose between the A miralty and King's courts about foreign co tracts, whereof they had been in peaceable p session time out of minde" (Prynne's *Anim version on the Fourth Part of Coke's In tutes,* 1668). An early record of the admin tration of maritime law in England is found the Domesday of Ipswich, 17 Edward I (A 1289). The *Black Book* has disappeared an English manuscript, which was in the libra of the Coilege of Advocates at Doctors' Co mons until the dispersal of the college in 18 had in recent years done service for the l original. The substantive sea law of the *Bla Book* is contained mainly in a transcript the Laws of Oléron. This last-named compi tion, which takes its name from an island the west coast of France, near Rochefort, is e tant in several manuscripts. The oldest of th written in a mixture of old French and Gasc and now in the Guildhall at London, where was brought from the archives of Bordeau probably dates from the end of the 13th c tury. The compilation is much older, no doul for the Laws of Wisby, by which the mercha of the Hanse towns and other German, Scan navian and Russian trading communities on t Baltic and North Sea regulated their condu are mere condensations of the Laws of Olér —and the Hanseatic League was formed in 12

A more complete code of sea laws than eith of those mentioned is the *Consolato del Ma* of uncertain age and pedigree. Hugo Grot asserts that it was compiled at the order of t "ancient Kings of Arragon," whereas Domeni Alberto Azuni and others claim it to have be the work of Pisan lawyers. Both may be rig The *Consolato del Mare* was evidently not co piled at one sitting; its matter is drawn from ma sources, including the Roman *corpus juris* and t laws and customs of Italian, French and Spani marts of commerce. While not completed u til the 14th century, the extant form is apparen the resultant of accretions to a nucleus da ing back possibly to the 11th century. An how, a *lex maritima* had become genera recognized in Europe toward the end of t 12th century and its distinction from the co mon law of England, as asserted by Willia Prynne, who is quoted above, is testified to an early rescript of the *Black Book* providi

that "all those who doe sue any merchant, mariner or other person whatsoever at common law of the land for any thing of auntient right belonging to the maritime law . . . shall be fined to the king for his unlawful and vexatious suite." The extent to which the ancient compilations have maintained their authority may be estimated from the fact that a fragment of the law of Rhodes, embodied in the Digest of Justinian and transcribed into the Consolato, states as correctly as any recent textbook the modern law of jettison and general average, while the fabric *de nautico foenore* (Dig. 22, 2; Code 4, 33) gives the present rules on bottomry and respondentia with absolute exactness.

The principal topics of Maritime Law (see articles under separate titles) are: Affreightment, under which head may be included the law governing contracts of shipmasters to carry freight and their resulting responsibilities as common carriers; Barratry, a sea crime which is committed when a master or crew do any unlawful acts tending to their advantage and to the detriment of the owner of a vessel — mutiny is an extreme form of barratry; Bill of Lading (q.v.; also COMMERCIAL LAW and NEGOTIABLE INSTRUMENTS); Bottomry. a form of contract whereby, figuratively, the keel or bottom of a ship, but in reality the entire vessel, is hypothecated to secure the repayment of money loaned, or to pay for repairs done or materials or supplies furnished and necessary to enable the vessel to complete a voyage; Charter-party, a contract of affreightment whereby the owner agrees, not to carry a particular consignment, but to let the whole or part of his ship to a merchant or other person for a particular voyage; Collision, under which title the rules for the assessment and apportionment of damage resulting from careless navigation are collected; Demurrage, the money required to be paid by the charterer for a vessel in compensation to the owner for her detention beyond the time agreed to for the loading or unloading of a cargo; General Average may be defined as contributions to be made by all parties interested in a ship or her cargo to make up the losses arising in consequence of an extraordinary sacrifice — for example, the jettison of part of her cargo — as the means of preserving from destruction the vessel or the rest of the goods she carries; Marine Insurance (q.v.) is a comparatively recent development of maritime law; the first policies it is said were issued by the Florentine merchant princes of the house of Medici; Pilotage, the practice of the pilot's profession is governed by local usages peculiar to each port and by legislative acts, which, in the United States, may take the form of either Federal or State laws; Registry of vessels and the transfer of ownership or flag, practically all matters under this head being regulated by statute in each country; Salvage, a compensation due to a person through whose gratuitous exertions a vessel or its cargo had been rescued from the perils of the sea; Wharfingers, properly "wharfingers," the owners, occupiers or custodians of a wharf.

All contracts of a maritime character are cognizable by the maritime law and enforcible by the courts administering the same. In the enforcement of contractual obligations arising out of the relations between insurer and insured or shipper and carrier or owner and charterparty, the common-law courts as well as the courts of admiralty might take jurisdiction. But in a case of bottomry, collision, general average or salvage, where the common law of the land and the law of the sea widely diverge, the jurisdiction of the maritime tribunals is paramount. Obligations *ex delicto* are justiciable in courts of admiralty when the wrong was committed within their territorial jurisdiction. This jurisdiction extends to the high seas, the national territorial waters where the tide ebbs and flows and other navigable water connects with and leading to tidewater. In the United States admiralty jurisdiction may extend even to navigable waters disconnected from the sea and situated entirely within a single State. The Federal District Courts exclusively have original jurisdiction in admiralty cases. Under the maritime law no more than under the common law could there be a recovery of damages for death negligently caused. Such recovery is now permitted by statutory enactment; but the limitation of owner's liability to the value of the salvage from the wreck in which the death occurred and to the freight money earned makes the statutory relief granted practically valueless. The English law on the subject is more liberal, though, where a calamitous loss occurs and the claimants are many, the total amount of damages recoverable is too small to be compensatory in any proper sense. In fact, it is possible that the limitation by law and distribution by insurance of the risks incident to maritime commerce may have too thoroughly eliminated the motive of self-interest as a factor in the promotion of efficiency and safety. When a ship is lost its owner may make a profit, receiving more than its value from the insurer; similarly, the merchant may, and often does, get more from the underwriter than the value of a cargo lost; the underwriter averages his losses and, on the whole, makes a profit out of his business. The laws for the inspection of vessels, the licensing of masters and other officers, the rules of navigation and concerning lights and other signals and the statutes prescribing imprisonment and other heavy penalties for neglect to observe these laws and regulations or supply the minimum life-saving equipment do not seem to provide an incentive equal to that which would be provided by the risk of an uninsurable total loss or unlimited liability for carelessness in the operation of vessels. The statutes, moreover, have been proven deficient in many respects — for instance, it appeared from the inquiry into a recent celebrated case that the inspection of hulls did not include a test of stability.

The rights and duties of masters and seamen toward each other, the vessel owner, the shipper or receiver of cargo and passengers are in part regulated by usage. By far the larger part of this department of the maritime law however is statutory. The administration of ports, the issue of clearance and other papers and similar police regulations affecting shipping are, generally, in the form of prescriptions made by the highest legislative authority, though they may be the subjects of mere municipal ordinances. These regulations have become internationalized by commercial treaties on a basis

of reciprocity, foreign shipping at practically all the ports of the world sharing burdens and advantages equally with domestic vessels. Domestic regulations with respect to life-saving equipment also have international scope, because no foreign vessel can leave a port without clearance and ship's papers will not be granted until the local safety rules have been complied with. The International Marine Conference held at Washington in 1894 evolved a set of "Regulations for Preventing Collisions" and the first internationally uniform "Rule of the Road." Articles 15 and 16 of the convention agreed to this conference, prescribing a system of sound signals and "moderate" speed in fog or thick weather, were considered the most important and innovatory of the regulations then adopted; but shipmasters have continued to act on the principle, "when in a place of danger, get out as quickly as possible." The Seaman's Act of 1914 and the Safety at Sea Conference held in Berlin in the spring of the same year are indicative of progress, though under existing world conditions their effect has not been appreciable.

Proceedings in Admiralty Courts are quite informal. Usually they are *in rem*, that is to say, the ship or cargo or some part of either are proceeded against rather than the master or owner in person. The initiation of an action takes the form of posting a libel, i.e., attaching the same to the mast or some conspicuous place on the vessel, or to that part of the cargo against which a claim is made. The attachment of a libel creates a lien which can be discharged only by the entry of a bond, or the deposit in court of adequate security, or the payment of the claim. See DANISH SOUND DUES.

STEPHEN PFEIL.

MARITZA, mä-rēt'sä, a river of Adrianople, the ancient Hebrus, rising as the Topolnitza, near the Bulgarian frontier, in the Balkan Mountains, and flowing through eastern Rumelia, southeast to Adrianople, where it bends to the southwest and falls into the Ægean Sea by the Gulf of Enos. It is over 300 miles long and navigable to Adrianople, about 100 miles from its mouth.

MARIUS, Gaius, Roman general: b. about 156 B.C., in Cereatæ, in the Volscian territory; d. Rome, 13 Jan. 86 B.C. He won his first military repute at Numantia in 134, beginning his rapid rise from the ranks; was made tribune of the people in 119; increased his political power by marrying Julius Cæsar's aunt; became prætor in 115; went to Spain in the next year, suppressing brigandage there; and in 109 accompanied Metallus to Africa. Two years later he was chosen consul, displaced his superior officer and made a brilliant campaign. His success was so great that he was elected consul four times in succession (104–101 B.C.)—a proceeding counter to law and entirely unparalleled—so as to meet the invasion of Italy by the Cimbri and Teutons. He defeated the latter tribe at Aquæ Sextiæ in 102, and the Cimbri at the Raudian Fields in 101. In 100 he was again elected consul. He made the fatal mistake of plunging into party politics, allied himself with the most disreputable leaders of the popular party, and, in his envy of the rising fame of the patrician Sulla (q.v.), attempted to remove him from his command in the Jugurthine War. Civil war broke out in 88. Sulla was victorious. Marius fled to Africa, whence he returned to Italy on the successful rising in Rome under Cinna. The first great proscription followed and many of Marius' opponents were killed. Marius was elected consul for the seventh time for 86 B.C., but died soon after he entered upon the office. Consult Beesly, 'Marius and Sulla' (1878).

MARIUS THE EPICUREAN, the chief work in fiction of Walter Pater. It is the story of a young Roman of the days of Marcus Aurelius, but in the problems and experiences of young Marius in ancient Rome, Pater has given also something of the problems and experiences of a young man at the end of the 19th century. In the days of Marcus Aurelius the ancient world was changing into the mediæval. Another such period was the Renaissance, in which the mediæval world was changing to the modern. In our days it may be civilization may be changing to something very different from the last few hundred years. Of the first of these great changes Pater wrote in 'Marius the Epicurean.' Of the second he began to give a picture in 'Gaston de Latour,' a later novel of which he wrote only the first part. To the last period, his own, Pater devoted critical rather than creative thought. 'Marius the Epicurean,' therefore, is deeply informed with ideas; in fact the very titlepage names "Sensations and Ideas." Pater became known first as a critic; in this novel he turned to express in the form of life the ideas which he had previously presented as matter of thought. A good many of Pater's ideas will be found in 'Marius': the fundamental conception of Epicureanism is a restatement of the theory of life which had already been presented in the conclusion of the Renaissance and had since been much and sometimes severely criticised. Flavian's plans for a career in literature have much in common with the ideas of the later essay on style. The work is characteristic of its author not only by its ideas, but by its general form. After this novel Pater published several shorter pieces which he called 'Imaginary Portraits.' In each of these he presented a figure which embodies some idea or position in the philosophy of art and life, sometimes an actual character like Watteau, sometimes an ideal figure like Sebastian von Storck. He subsequently wrote several other things of the same sort which is now generally thought of as very characteristic of his art and thought. 'Marius the Epicurean' is an earlier, longer and more fully developed imaginary portrait. Its interest is not in the

story, but in the idea, or in this case in the progress of the idea. Marius grows up in the old pagan world, comes to know all the cultivation and refinement of the ancient civilization, weighs the older philosophies of life and art and finally devotes himself to the new and growing religion of Christ. Like all of Pater's fiction the story is most sedulously careful of its surroundings and environment, and the pictures of life on the great old Roman family estate, the popular festival, the interview with the emperor, the lecture on rhetoric by Fronto are among his best known. In fiction in general there is an especial place for those books which present adventures and experiences of the soul rather than of the man as seen in the everyday world. There were a number of such at the end of the 19th century. Among the most famous of these studies of the religious life are 'John Inglesant' and 'Robert Elsmere.' 'Marius the Epicurean' is quite as interesting as either of these to those who follow the workings of the spirit, and quite as characteristic of the time which it presents and of the time in which it was written.

EDWARD EVERETT HALE.

MARIUT, mä-rē-oot', **Lake,** Egypt. See MAREOTIS.

MARIVAUX, Pierre Carlet de Chamblain de, pē-ār kär-lā dė shäm-blăn dė mä-rē-vō, French dramatist and novelist: b. Paris, 4 Feb. 1688; d. there, 12 Feb. 1763. He lost his patrimony in the Mississippi scheme, and also a young wife to whom he was deeply attached, and took up literature as a living. He was so successful that he became an Academician in 1742 or 1743. He wrote essays in periodical form, the 'Spectateur Français' having a hint of English influence in both matter and name. His novels, especially the unfinished 'Vie de Marianne' and 'Paysan parvenu,' were a protest against the literary morals of contemporary fiction. But he is best known for such plays as 'Les Jeux de l'Amour et du Hasard' (1730), 'Les Fausses Confidences' (1738), 'Le Legs' (1736) and 'La Mère confidente' (1735), which are marked by a total opposition to the style and manner of Molière, by much skill in intrigue and in portraying women and by the peculiarly artificial and elaborate style, which takes its name 'Marivaudage" from the author. Consult Savollée, 'Marivaux inconnu' (1880); Fleury, 'Marivaux et la Marivaudage' (1881); Gossot, 'Marivaux Moraliste' (1881); Larroument, 'Marivaux, sa Vie et ses Œuvres' (1894); Deschamps, 'Marivaux' (1897).

MARJORAM, a genus of annual or perennial herbs and a few shrubs (*Origanum*) of the family *Menthaceæ*. The species of which there are about 25 are mostly natives of the Mediterranean region and southwestern Asia. They have several-flowered whorls of labiate flowers arranged in spikes. Two species are widely cultivated in gardens for culinary purposes, being used fresh, dried or in decoction for flavoring soups, stews, dressings, sauces and salads. Common or pot marjoram (*O. vulgare*) is a hardy perennial with pink or purple flowers and highly aromatic leaves. It succeeds best upon warm garden soils well exposed to the sun, and may be propagated by seeds, divisions or cuttings. Sweet marjoram (*O. marjorana*) is also a perennial, but is tender and consequently treated as an annual, hence the popular name annual marjoram. It is usually raised from seeds sown in a hotbed or greenhouse and transplanted to ground like the above.

MARK. The original Jewish name of Mark was John (Acts xii, 12, 25; xv, 37), and it is not known when he was given or assumed the second, Latin, name by which he has always been known. Of his early life nothing is positively known. It cannot be said to be more than an attractive possibility that it was at the house of his mother, Mary, that Jesus met his disciples for their last supper, and that in consequence this upper room became the permanent meeting place of the Jerusalem disciples, and also that Mark was the youth who followed the crowd to the arrest of Jesus in Gethsemane. Peter later called him his "son" (1 Peter, v, 13), from which title it is commonly inferred that he began his Christian life under the influence of that apostle. The first distinct appearance of Mark in history is as an attendant of Paul and Barnabas, the latter being his cousin (Col. iv, 10, not "nephew," as the Greek word has been erroneously translated). The party went from Antioch to Cyprus and thence to Perga, on the mainland of Asia, where Mark deserted, returning to Jerusalem. Because he did this Paul refused to take him on his second missionary tour and a break with Barnabas resulted, after which Mark accompanied the latter to Cyprus again. A reconciliation with Paul must have later come about, since Mark is favorably spoken of in Paul's letters to the Colossians and to Philemon, as again still later in the second letter to Timothy. More uncertainty attaches to the mention of Mark in First Peter. Perhaps the most satisfactory conclusion is to take "Babylon" as designating Rome and for this and other reasons (see article PETER, EPISTLES OF) to give to this mention a still later date. On this view, after the death of Paul, Mark would have remained in Rome and have attached himself to Peter. This would be in harmony with the language of Papias who asserted a relation between the two. Any further details rest on more or less uncertain tradition. The reported connection of Mark with Alexandria is in no way improbable, but whether he was a martyr there or died a natural death is unknown. The tradition that he was connected with the church at Aquileia, which is the basis of the honor paid in Venice to his memory, is no more to be depended on. It may have been the result of personal reminiscence that the epithet κολοβοδάκτυλος was attached to him. This word means stunted or mutilated in the fingers ("stub-fingered" ?), but its application in Mark's case is nowhere defined, and many explanations have been proposed, such as, that his fingers were unnaturally short; or, as the Greek word would equally apply to toes, that they were shortened, perhaps causing lameness, or that he had mutilated himself to evade priestly service; or, finally, that the word is used figuratively to suggest the comparative brevity of his gospel and its failure to contain much that is found in Matthew and Luke. For the connection of Mark with the second Gospel and bibliography, see article MARK, GOSPEL ACCORDING TO.

DAVID FOSTER ESTES,
Late Professor of New Testament Interpretation, Colgate University.

MARK, Edward Laurens, American anatomist: b. Hamlet, Chautauqua County, N. Y., 30 May 1847. In 1871 he was graduated at the University of Michigan, and in 1876 took the degree of D.Ph. at the University of Leipzig. Dr. Mark was instructor in mathematics at the University of Michigan in 1871–72 and in the following year was astronomer of the United States Northwest Boundary Survey. From 1877 to 1883 he was instructor in zoology, from 1883 to 1886 assistant professor and since 1885 Hersey professor of anatomy at Harvard University. In 1900–21 Dr. Mark also served as director of the Harvard Zoological Laboratory. Since 1903 he has been director of the Bermuda Biological Station for Research. He was United States delegate to the Fourth International Zoological Congress at Cambridge, England, in 1898. He has translated from the German, O. Hertwig's 'Text-Book of the Embryology of Man and Mammals' (1892); Korschelt und Heider's 'Text-Book of the Embryology of Invertebrates,' and published contributions to the *Bulletin of Comparative Zoology.* He edited contributions from the Zoological Laboratory, Harvard Museum of Comparative Zoology, 1884–1921. Consult Parker (ed), 'Mark Anniversary Volume' (New York 1904).

MARK, Gospel According to. Character and Purpose.— Of the four little books called «Gospels» the second is the briefest and simplest. In the most direct fashion possible salient events of the Galilean ministry of Jesus are set forth in the first two-thirds of the book, while the last third is mainly occupied with the events of the last week of Christ's life and of his death and resurrection, the second part being given with much more of detail than the first. The book might be analyzed as follows: Introductory, the ministry of John the Baptizer, the baptism and temptation of Jesus (i, 1–13). I. The early Galilean ministry of Jesus, marked both by wide attention and by increasing hostility which culminated in the charge that Jesus was in league with Satan, this part of Christ's work ending with the choice of the 12 apostles (i, 14–iii, 35). II. Later ministry in Galilee and its neighborhood, introducing parabolic teaching and consisting largely of the training of the 12 (iv, 1–x, 52). III. The entry into Jerusalem and the Jerusalem teaching, mainly controversial, in the Temple (xi, 1–xii, 44). IV. The Eschatological Discourse (xiii, 1–37). V. The closing scenes, anointing at Bethany, last supper, agony in Gethsemane, death and resurrection (xiii, 1–xvi, 20 (8?). No purpose appears except to bring the events recorded as clearly before the readers' minds as possible, so that they might know thus much, at least, of what Jesus did and said. The book manifestly is not a missionary tract with the intent to persuade the unconvinced, but rather one who is himself a disciple tells these things to his fellow-disciples for their instruction. It has often been overlooked that the author presents as himself accepting the stupendous claims of Jesus to be the supreme master of men and their destiny and his corresponding demands for their supreme allegiance. But while these are carefully and sympathetically recorded, the main impression gathered from this record of the ministry of Jesus is that of a mighty, unresting, triumphant worker, who yet evokes the intensest hostility of the religious leaders of his nation. But the primary purpose to be recognized throughout is narration.

Authorship and Sources.— No name has ever been connected with this book except that of Mark. Presumably because of its brevity which might seem perhaps to involve incompleteness, this Gospel was for a long time less quoted than Matthew or Luke. But as it was included in the 'Diatessaron' of Tatian it must have been in general acceptance for some time before the year 150; in fact, there is no reason to doubt that from the time of its composition wherever known it was accepted as authoritative. The earliest tradition which has come down to us, connecting itself with the name of Papias who was acquainted with a number of apostles and others who had seen Jesus, makes Mark the author of a narrative which embodied the reminiscences of Peter. The second Gospel answers well to this description. There are many touches which imply the remembrance of an eyewitness, such as that the grass was green (vi, 29); the look of Jesus (iii, 5); or his turning to look (v, 32). The tradition that this eyewitness was Peter is confirmed by the character of many details of events in which Peter had a share or in which he would be specially interested. It is not, however, to be thought that Peter was Mark's sole authority or even that the principal share of the book is due to him. It may well be held that the main source from which Mark drew his material was the common stock of apostolic reminiscence and preaching, what must at first have been an «oral gospel,» which presumably took a somewhat stereotyped form both in content and in language for catechetical purposes (Luke i, 4) and which may have been committed to writing before Mark used it. It has been held by some that Mark also shows knowledge of the «Logia» document (also called «Q,» see article GOSPELS), but in our ignorance of the scope of this document Mark's knowledge of it cannot safely be asserted.

Date and Place of Composition.— No date can be positively set for the composition of the Gospel according to Mark. It has been commonly dated immediately before the destruction of Jerusalem and thought to have been written at Rome. The latest conclusion of critics, notably of Harnack, based on his view of the early date of Luke's writings, sets the date decidedly before the year 60 and makes Jerusalem the place of original composition. There, or at Rome later, it might have been seen by Luke in its earliest form, while it is possible that additions were made to it before it was given to the world in its present form, which probably happened at Rome. (The «Latinisms» in its language are, however, no proof of relations to Rome, as they are merely such as had been everywhere in the empire adopted into the «Koine,» the common Greek of the time). It has been suggested that Mark's repeated revision of his original work resulted in what may be called three editions, the first, Palestinian and used by Luke, the second, made at Alexandria (with which city tradition associates Mark in his work), and used by the author of the first Gospel, the third, our present Gospel according to Mark, having been completed and given to the world at Rome. (See

rticle GOSPELS). Much of this theory, how-ver, is undemonstrable. But it seems safe to ssert that the substance of the book belongs ecidedly before the year 60 and was very ossibly composed in Palestine, while in its nal form it is connected with Rome.

Integrity.—It is the verdict of textual criti-ism that the last verses of the Gospel (16:9–0) were not a part of the original work. They re lacking in only two manuscripts, the Vatican nd the Sinaitic, but these are the most valued f all. A manuscript of the Old Latin replaces ese verses with another, shorter ending for ie genuineness of which no one contends, and our Greek uncials, one cursive, and also manu-cripts of early translations into Syriac and ther languages give both endings. An Arme-ian manuscript gives the name Aristion as the uthor of the verses in question. There is, urther, a notable lack of quotation of these erses by the Fathers, while several Fathers ssert that in their time they were not to be ound in the best copies of the Gospel. On he basis of the merely textual evidence, owever, the genuineness of these verses might e accepted, but there is general agreement mong scholars that the internal evidence is ecisive against their genuineness. The vocabu-ary, the style, the thought of these verses are ufficiently unlike the rest of the Gospel so that he great majority of competent critics hold that hey are not by Mark. Various explanations ave been proposed for the abrupt close of the riginal text at the end of the eighth verse, as hat the author might have been interrupted in ome way and never finished his book as he ntended, or that the last leaf was lost from he text which was the source of all our copies, nd that some one (Aristion?) later attempted o make good the loss, but while any of the roposed explanations may be possible, it can-ot be said that any of them are probable.

Authenticity and Value.—While, as has een said, for many centuries both Matthew nd Luke were more used and valued than Mark, this judgment has of late been reversed. As it is the oldest of the three Synoptics, or at ny rate preserves the original traditions of the Palestinian Church in their most primitive and unmodified form, it is of the highest value as record. This value is of course enhanced by he fact of Mark's association with so many of he early leaders of the Church, and still more y the contribution which Peter, in particular, s recognized to have made to the materials em-loyed. The modern critical estimate may be elatively unfair to the value of the other Synoptics, but is doubtless absolutely correct in ts high estimate of the authenticity and value f this Gospel.

H., *The Gospel According to Saint Mark* (1902); Zahn, Theodor, *Introduction to the New Testament* (Eng. trans., 1909); Bacon, *The Gospel of Mark* (1925).

DAVID FOSTER ESTES,
Late Professor of New Testament Interpreta-tion, Colgate University.

MARK, an old English term for a money of account, and in some other countries for a coin. The English mark originated in the 12th century and was valued at $3.33, and the Scottish mark, or merk, of the 19th century was $3.42. In the coinage of the German Empire the mark is a coin of nearly the same value as the English shilling. A mark banco used to be a money of account in Hamburg equal to 37 cents, nearly. The mark was also used as a weight in several parts of Europe, being divided into 24 carats.

MARK, Order of Saint, a Venetian order of knighthood. The doge, as well as the Senate, elected knights of Saint Mark, who enjoyed a pension. Foreigners also, particularly scholars, were elected. Saint Mark the Evangelist was the patron saint of the Venetian Republic.

MARK ANTONY. See ANTONIUS, MARCUS.

MARK TWAIN. See CLEMENS, SAMUEL LANGHORNE.

MARKED TREE, town, Arkansas, in Poinsett County, 40 miles northwest of Memphis, Tenn., on the Frisco Railroad. It is within a few miles of Saint Francis Lake and is located in a thriving lumber district. It contains lumber factories, a cotton compress, implement companies, and a de-linting plant. It has also a district high school and two banks. Pop. (1950) 2,878.

MARKETING. — Definition. — Marketing, as defined by the Committee on Definitions of the American Marketing Association, "includes those business activities involved in the flow of goods and services from production to consumption." Marketing, therefore, is made up on one hand of such physical activities as transporting, storing, and selling goods, and on the other hand of a series of decisions which must be reached by any organization undertaking any part of the process of moving goods from the producer to the user.

Growth of Marketing Methods.—The importance and complexity of marketing activities have increased steadily in the years since the Industrial Revolution. In a simple village economy, the shoemaker ordinarily purchased his leather and other materials from near-by producers and took orders from his neighbors for relatively simple footwear. The quality of his work was easily recognized, and protests against poor workmanship could be made easily and directly. The shoemaker himself had no difficulty in gauging in advance what kinds of shoes would be desired by his customers or the number of shoes he should make, nor did he have to entrust any part of his relationship with those customers to others.

As specialization in production has developed and the scale of manufacturing operations has increased, producers and their customers have become widely separated in space, in time, and in knowledge. The producer of automobiles in Detroit sells throughout the United States and, indeed, throughout the world. He produces not upon the order of a particular customer for a particular automobile but rather upon the basis of anticipated future sales to unknown customers. In this anticipation of future sales, he must in turn place orders for materials and component parts well in advance of his own production period. Finally, the increasing multiplicity of the

goods manufactured and used by the people of the United States, has led to a lack of intimate knowledge on the part of the buyers of the inherent qualities of those goods. Millions of people buy mechanical refrigerators and other household appliances without personal understanding of how the appliances function and without the ability to judge the workmanship.

As the scope of marketing activities has broadened, the amount of effort devoted to these functions measured in employment or in dollars, has naturally multiplied. Many estimates have been made as to the proportion of the consumer's dollar absorbed by production on one hand, and by marketing on the other. These estimates differ somewhat, but there is rather general agreement that marketing activities took more than half of the consumer's dollar in the years immediately preceding the Second World War. Figures for employment in retail trade, in wholesale trade, in transportation, in the sales departments of manufacturers and producers, in the facilitating activities of advertising agencies, publishing firms, and the like, lead to the conclusion that the steady increase in the proportion of our working population engaged in marketing activities prior to the war, had reached the point where they outnumbered those engaged in manufacturing or production.

Although the role of marketing activities has expanded substantially since the Industrial Revolution, literature on the subject has developed only within the last 30 to 40 years. Many publications devoted to various aspects of marketing have been developed and authoritative information has become available to those interested in the subject. During this period, courses in marketing, and in the various subdivisions thereof, have become common in the colleges and universities. Latterly, marketing research has developed as a highly specialized activity, in which thousands of individuals and hundreds of specialized firms are engaged.

Principal Subdivisions of Marketing

The early literature of marketing is full of discussions as to what should be considered marketing functions. There are such physical activities as transporting and storing merchandise. There are also the functions of making decisions on such questions as how the product should be designed; how it should be packed; what retail and wholesale channels should be used; whether advertising is advisable and, if so, how much and what kinds; what prices should be set, not only to final buyers but also to whatever intermediaries may be used; and what pricing policies should be observed in regard to such matters as quantity discounts, terms of sale, and the like.

Although there is as yet little agreement on what are properly to be included as marketing functions, it is very clear, from the standpoint of the individual businessman, that these and similar questions must be answered as part of the marketing task. As one convenient way of dealing with such questions, they may be grouped under the following heads: merchandising; channels of distribution; brand or trademark policy; sales promotion (including advertising and personal salesmanship); pricing and price policies; control of marketing operations.

Merchandising.—This term has many meanings. To some it is synonymous with marketing; to others it is synonymous with retailing. In the advertising world, many men use the phrase "merchandising the advertising to the salesmen" to mean "informing and making the salesmen enthusiastic about the advertising campaign being carried on by their employer." Others say "Merchandising is getting the goods onto the dealers' shelves; distribution is getting them off."

The meaning given to merchandising in this article is none of these, but rather "the adjustment of the merchandise produced or offered for sale to customer demand." Merchandising for the merchant means decisions and actions with regard to what goods and what quantities of them should be bought for resale. Merchandising for the manufacturer means selecting the product or products to be produced, deciding on size, appearance, form, and packaging, and determining the quantities to be produced during any given time. Thus, in manufacturing, merchandising activity can be regarded either as a part of production or as a part of marketing. It is the point at which the production department and the sales department most often come together. Effective merchandising, therefore, requires the closest coordination of those two departments.

The importance of advance knowledge as to the acceptance which will be accorded to a new product or to a redesigned version of an established product has given considerable impetus to a variety of methods of testing consumer reactions in advance of large-scale marketing efforts.

One vital factor in the merchandising task is that of coping with fashion. For some products, such as millinery and women's and misses dresses, the merchandising task is almost entirely that of gauging fashion trends, but even automobile designers carefully study trends in the popularity of colors. Fashion is not synonymous with style. Dr. Paul H. Nystrom defines style as "a characteristic or distinctive mode or method of expression, presentation, or conception in the field of art."[1] A style is, therefore, a more or less permanent phenomenon in contrast to a fashion, which is usually temporary. A style may or may not be a fashion at any given time; it becomes a fashion when it is generally accepted by the people. Queen Anne is a style of furniture, but it does not happen to be a fashion because it is no longer in widespread use. Any fashion has its beginning when a relatively few people are influenced by it, its culmination when large numbers of people follow it, and its decline when it is gradually abandoned by more and more of its followers. Many theories as to the psychological motivation for this fashion cycle have been formulated. Fashion, like the stock market, is essentially a manifestation of group psychology. Fundamentally, these matters are still little understood, but practical businessmen have developed methods for scrutinizing the trend of sales in their own establishments and elsewhere which somewhat reduce the hazards of handling fashion merchandise.

In the merchandising of all types of goods, whether fashion is a major element or not, experience has demonstrated the importance of paying close attention to the buying motives of the potential customers. To do this it is first necessary to determine who the potential customers for the particular product or service are. They may be a handful of large corporations

[1] *Economics of Fashion*, p. 3. (Ronald Press, New York 1928).

uying for use in their own manufacturing rocesses, or the general public buying to satisfy ome personal need or desire.

The distinction implied in the contrast between usiness buyers and the general public is the asis for a classification of goods and services, f great importance in marketing, as industrial oods or consumers' goods. The latter are ought by the public for the business of living. 'ood and clothing are typical of relatively per- hable consumers' goods, whereas washing ma- hines, automobiles, and dwellings are typical of o-called consumers' durable goods. Industrial oods, on the other hand, are bought by business rms for use in the production and marketing f their own output. Industrial goods range rom operating supplies, such as brooms and weeping compounds, to major machinery and quipment and even the factory building itself, nd from raw materials to fuel and power.

Channels of Distribution.—To the merchant, hether a wholesaler or a retailer, the decision s to what goods to buy for resale is a principal art of merchandising. To the merchant's sup- lier, the decision to sell to him is a part of ie supplier's selection of his channels of dis- ibution. The manufacturer of consumers' oods must decide in general what types of retail tores are the best for his product. Then he ust decide whether to have his own salesmen ell direct to these retailers or to sell to whole- alers for resale to the retailers. If he elects to ell through wholesalers, he must decide which ypes of wholesalers, and he must also choose hether to sell to them direct through his own alesmen or through such intermediaries as brok- rs and manufacturers' agents.

Similarly, the manufacturer of industrial oods faces the question whether to use such in- rmediaries as mill supply firms and manufac- irers' agents or, to utilize his own sales force, orking out of the main factory office or, out of ales branches strategically located throughout ie country.

Policies must be formulated not only as to ie types of intermediaries to be used but also s to their number. At one extreme is a policy f exclusive distribution, under which the retail r wholesale intermediary is the sole outlet for ie product or service in some particular terri- ory. Typical of this policy is the automobile ndustry, with each "franchised" dealer protected ithin a specified territory against the competi- on of other dealers. At the other extreme is a olicy of intensive distribution, characterized by forts to secure the maximum possible number outlets. Typical followers of this policy are ie major cigarette manufacturers, who want l the outlets they can get. Between these two xtremes are many policies which may be rouped under the term "selective." Under this pe of policy, certain chosen outlets are on the asis of criteria important to the manufacturer, ich as prestige in the community, size, ability provide installation or repair service, and the ce.

There are three major considerations to be ken into account in arriving at a policy in re- ard to the number of outlets to be sought: (1) e willingness of prospective buyers of the par- ular product to seek out a source of purchase; 2) the ability of the intermediary to contribute the effective promotion of the particular prod- t; (3) the intermediary's willingness to make such promotional efforts if the benefits from those efforts accrue largely to him.

In addition to deciding what policies to follow concerning the channels of distribution to be used, the marketer must exert much effort and show much ingenuity in putting the policies selected into effect. Much of the day-to-day work of marketing consists of seeking to make particular retail stores, or wholesale establishments, of the type selected, want to carry the product. Much of the sales promotion program must often be directed to this end. Advertising in trade and other publications, preparation of effective display and other material useful or appealing to the dealer, offering of attractive profit margins—all these are designed to supplement and reinforce the work of the salesman in inducing retailers, wholesalers, or other intermediaries to carry the product or line of products.

Brand Policy.[2]—A trademark is a distinctive word, emblem, symbol, or device, or a combination of these, used on goods actually sold in commerce to indicate or identify the manufacturer or seller of the goods.[3] In business terms a trademark is a short cut to the customers' memory. The picture of the little Dutch girl and the phrase "Old Dutch Cleanser" can be retained in the memory far more easily than could "cleanser produced by the Cudahy Packing Company." Through constant use on packages and in advertising, many trademarks have almost entirely eclipsed the name of the manufacturer. By actual test, dozens of persons know and use the trademarks "Vaseline" for every one who knows the Chesebrough Manufacturing Company, even though every jar describes "Vaseline" as the Chesebrough Manufacturing brand of petroleum jelly.

Because of their importance as a short cut to the customer's memory, well-established trademarks are considered to have substantial cash value. In transactions involving the sale of one business to another and in some court decisions, well-known trademarks have been valued at many millions of dollars. As might be expected a body of law and precedent has developed and is continuing to develop for the protection of property of such value. The basic principle is that ownership of a trademark is acquired by prior use (that is, the first actual user in commerce is the owner), and registration of trademarks by the United States Patent Office is provided for by the Act of March 19, 1920.[4]

Careful observance of the legal technicalities in the choice and development of a trademark is important. Of equal importance from a business standpoint is the selection of a trademark which will easily become a short cut to the customer's memory—one which lends itself readily to advertising and sales promotion and has pleasant rather than unpleasant connotations for the prospective customer.

---

[2] A brand may include a brand name, a trademark, or both. The term "brand" is comprehensive, including practically all means of identification except perhaps the shape of the product and the package. The brand name is that part of the brand which may be vocalized. (Paraphrased from Committee on Definitions, American Marketing Association).

[3] *General Information About Protection of Trademarks*, pp. 1–4. (Government Printing Office, Washington 1944).

[4] For a full discussion of the legal aspects of trademarks, see *Unfair Competition*, by Zechariah Chafee, Jr., (The Harvard Law Review Association, Cambridge, Mass. 1940).

The addition of a new item to the line of a manufacturer often gives rise to the question: "Shall the new item carry the same trademark as the existing items?" The use of a so-called family brand assures the newcomer of benefits from some of the goodwill that may have developed. On the other hand, the promotional needs of the new item may be secured more adequately by a distinctive trademark. As an extreme illustration, the well-known trademark for Ivory soap was understandably not deemed suitable for the vegetable shortening Crisco, made by the same company.

The importance of the brand which has gained public acceptance or preference as a means of controlling sales, has led to the description of the widespread conflict between two opposing methods of marketing, as the "Battle of the Brands."

On the one side are manufacturers of merchandise carrying brands featured in extensive magazine, newspaper, and radio advertising, often national in scope, and relying relatively little on the promotional efforts of retailers and wholesalers. With this type of brand, the retailers and wholesalers are generally little more than necessary links in the chain for making goods physically available to prospective buyers. Whatever the personal preference of the retailer, he must carry the well-known brands of cigarettes, for example, if he is to do business in tobacco products; the development of demand by the manufacturers makes this certain.

On the other side are retailers and wholesalers with their own brands of merchandise, frequently produced by manufacturers to the retailer's specifications. Such brands are often called "private" brands, although they are more accurately described as "distributor's" brands. When the corner druggist has a particular formula for cough syrup or antimosquito lotion put up under his own brand name, he is following a distributor's brand policy in a small way. But the battle is really joined when large-scale retailers, such as the great food chains, the large mail order houses, or important department stores, seek to develop wide public acceptance for a great range of products under their own brand names. Because the responsibility for maintenance of quality and the development of public acceptance rests on the owner of the brand, in this case the large-scale retailer, the manufacturer is limited to producing to specifications at as low a manufacturing cost as possible. The retailer, through his contact with the market, therefore, often becomes the dominant enterprise in the chain of service bringing goods to prospective buyers.

Sales Promotion.—The principal methods of promoting the sale of a product, aside from the inherent qualities of the product itself and its price, are personal salesmanship and advertising.

A marketing organization handling consumer goods must decide whether it will use salesmen to sell to final consumers (e.g. the retail store salesman or the house-to-house canvasser for vacuum cleaners or hosiery), to retailers, or to wholesalers, with or without the assistance of so-called missionary salesmen,[5] or whether it will rely entirely on advertising. Similarly, a marketing organization handling industrial goods must decide whether its sales should be promoted by salesmen, or whether it can rely on catalogues and other forms of advertising.

The management of sales organizations is a field of major importance in itself. Sales management includes the selection of salesmen, their training to serve the particular needs of the firm by which they are employed, the working out of the best methods for determining their compensation, and the control of their activities. The control of salesmen's activities includes planning the number and location of customers to be solicited, possibly the laying out of the sequence in which customers are to be visited, the planning of the type of presentation to be made to prospective customers, and the appraisal of the performance of individual salesmen.

Advertising has been one of the most thoroughly studied aspects of marketing. Many types of advertising media have developed: newspapers; general circulation magazines; special circulation magazines, including so-called trade magazines, editorially devoted to the interests of particular trades or types of business executives (e.g. purchasing agents, power plant superintendents); radio broadcasting, both local and network; billboards along highways and city streets; car cards in public transportation systems; catalogues; direct mail advertising in many forms. The motion picture has been increasingly used as an advertising medium, often for use at large gatherings of prospective customers. Exhibits of various kinds at conventions and trade gatherings have long served the same purpose.

The marketing organization seeking an effective advertising program must give close attention to the selection of the medium or combination of media best adapted to the particular market to be sought, and the particular product to be promoted. Similarly, the construction of the advertising material to be used in these media requires careful attention to the determination of the buying motives which should be emphasized most strongly and to the most compelling ways of appealing to those buying motives. The need for specialized attention to these problems has been largely responsible for the growth of the many advertising agencies which perform these functions for their clients.

Not infrequently, the characteristics of the particular market for a particular product are such that expenditures for advertising are not likely to yield much return in sales. Sound judgment on this point by marketing organizations often has an important effect on the profit and loss statement.

Price Determination and Price Policies

The individual wheat farmer does not put a price on his crop. He is offered a price adjusted by conventional amounts from the current quotation on an organized exchange, and his decision is limited to whether he will hold or sell at that price. Only as large numbers of farmers, millers, and speculators change their decisions as to whether to hold, sell, or buy, does the price quotation change materially. Much current economic writing implies that earlier economists believed that such a condition prevailed throughout the business structure. This view may be an injustice to those earlier economists, but in any event, the plain fact is that most marketing of-

[5] Missionary salesmen, known as "detail men" in some industries, call on customers to encourage the placing of orders. In the dental trade, for example, manufacturers employ "detail men" to call on dentists to encourage them to place orders for the manufacturers' products with dental supply houses.

anizations do face the problem of putting a rice on their product, and not merely the ques-on of manufacturing or not manufacturing at n established market price. The greater the egree to which the product is differentiated rom other products, the more attention can be ntered on factors other than the prices of mpetitive products. Conversely, the more the roduct resembles competitive products in ap-earance and performance, the more competitive rices will govern price policies. Since one of ne outstanding features of our industrial de-elopment has been the widespread differentia-on of products, thus greatly widening the range f the consumers' choice, it follows that the prob-m of setting prices has tended to become more, ather than less, important to marketing manage-ents.

In the typical situation, the pricing problem ncludes the establishment not only of prices to ttract buyers, but also of prices to whatever uccessive tiers of intermediaries are included n the marketing program. It may also involve ecisions as to whether special discounts are to e offered for purchases in relatively large uantities. The pricing problem often includes ne decision as to whether all customers, or all ustomers of a particular type or class, are to be uoted the same price, or whether individual alesmen or higher officials are to be permitted o lower prices for especially vigorous bargainers, r to recognize circumstances which result in articularly low costs to the seller. Finally, the ricing problem includes decisions as to terms of ale and delivery.

The Marketing Program.—Recognition of ne interrelationship of the several subdivisions f marketing described above has led experienced arketing executives to think and act in terms f a co-ordinated marketing program. Decisions n the channels to be used bear directly on the ricing problem; decisions on price are tied in-eparably to the problem of the selection of hannels; and both in turn directly influence de-isions in regard to methods of sales promotion. uccessful marketing results from the effective arrying out of a well co-ordinated marketing rogram, in which every element supports every ther element.

Marketing Institutions

The principal source of quantitative statistical nformation concerning marketing institutions is ow the census of the United States. The first ich census of marketing institutions was the ensus of distribution of 1929. A second enu-eration was the census of American business of 933; a third, the census of business of 1935. The ost recent was a part of the regular 16th census f the United States in 1940, covering the census f business for the year 1939.

Basically, marketing institutions may be di-ided into retail institutions, wholesale institu-ons, and producers' marketing departments or gencies.

Retail Trade.—In 1939 there were 1,770,355 etail stores of all types in the United States. his number represented an increase from 1,587,-18 in 1935 and 1,476,365 in 1929. Retail trade emains perhaps the greatest single stronghold f the individual small businessman. There were ,613,673 active proprietors of unincorporated usinesses in the retail field in 1939. The ,770,355 different retail stores had sales slightly in excess of $42,000,000,000 in the same year. They employed 4,600,217 employees (not including the active proprietors of unincorporated businesses mentioned above), and their payrolls totaled approximately $4,500,000,000.

Retail stores may be classified in a number of different ways: as to the types of goods sold; as to whether or not they are operated as single stores, or as parts of a corporate chain, or as voluntary associations; as to whether they do principally a cash or credit business; as to their general level of prices and quality of merchandise carried, and the like.

Numerically, the food group bulks largest when retail stores are classified according to the type of goods sold. Roughly, a third of all retail stores are in this group. When eating and drinking places to the number of more than 300,000 are added, nearly half the retail stores of the country purvey food in one form or another. On the average, however, stores in the food group are smaller, measured by dollar sales, than other stores, and therefore dollar volume of food sales (excluding sales of eating and drinking places) represented only about one quarter of the total retail sales in 1939.

Filling stations, of which there were 241,258 in 1939, ranked next to food stores in number and had sales of $2,833,495,000. Department stores, which appear as a subdivision of the general merchandise group, numbered only 4,074 but had sales of $3,974,998,000. By definition, the department store is one which carries a relatively wide range of merchandise and has a departmentalized form of organization. The census does not classify stores with sales of less than $100,000 annually as department stores. Some department stores have sales well above $50,000,000 per year.

Retail stores may also be classified according to whether they are owned and operated by chain store organizations, by individual proprietors, or whether they are members of voluntary chains or co-operative associations. The corporate retail chain has reached its greatest development in the variety and grocery fields, although it is also important in the drug, clothing, and filling station business. Chains of the type of F. W. Woolworth Company, S. S. Kresge Corporation, W. T. Grant Company, and many others do a very high proportion of the total business in the variety field. In the food trade, the Great Atlantic & Pacific Tea Company, Safeway Stores Corporation, Kroger Grocery and Baking Company, and First National Stores Incorporated, carry on approximately 40 per cent of the nation's retail food business.

To meet the competition of big chain enterprises, a large number of individual stores have linked themselves with wholesalers in so-called voluntary chains which use a common name, sell many items under a common trademark, and follow a number of uniform management practices. This type of enterprise has grown to considerable importance in the food field and is found occasionally among automotive supply stores.

Wholsale Trade.—The census classifies all wholesale establishments into six major types of operation groups: (1) service and limited function wholesalers; (2) manufacturers' sales branches (with stocks); (3) manufacturers' sales offices (without stocks); (4) petroleum bulk stations and terminals; (5) agents and brokers; (6) assemblers (mainly farm products). These

major classifications may be broken down in more detail. The first category of service and limited function wholesalers, which included 101,627 firms out of a total of 200,573 wholesale establishments in 1939, was made up of the following:

Wholesale merchants	91,323
Voluntary group wholesalers	703
Converters (textile)	631
Export merchants	586
Importers	2,158
Industrial distributors	1,471
Cash-and-carry wholesalers	1,198
Drop shippers and desk jobbers	937
Wagon distributors	2,398
Retail—co-operative warehouses	222

For the most part, wholesale merchants buy goods outright from manufacturers and suppliers and resell them to retailers or other outlets, usually granting credit and extending delivery service. Such firms may carry a broad line of merchandise or a relatively specialized and narrow line. In contrast to the services offered by wholesale merchants, the cash-and-carry wholesalers, as the name implies, require their customers to transport the merchandise themselves and to pay cash for it. Drop shippers never take possession of merchandise, but simply secure orders which the manufacturer or supplier fill direct to the customer.

Manufacturers' sales branches (with stocks), of which there were 12,977 in 1939, and manufacturers' sales offices (without stocks), of which there were 5,119 in 1939, perform different parts of the wholesale function. Sales branches or offices may be established by manufacturers for the purpose of sale or resale to wholesalers, or for sale to retailers, or for sale to final buyers, either individual consumers or industrial enterprises.

The general category of agents and brokers, of which there were 20,903 in 1939 includes the following types:

Auction companies	649
Brokers (merchandise)	4,710
Commission merchants	2,758
Export agents	654
Import agents	394
Manufacturers' agents (with stocks)	1,907
Manufacturers' agents (without stocks)	7,871
Selling agents	1,487
Other agents	473

These various categories reflect differences in the arrangements between manufacturers and agents or in the method of operation of wholesale enterprises. A common characteristic which distinguishes this group from the service and limited function wholesalers is that they do not buy and resell for their own account but serve as selling or buying representatives, usually on a commission basis.

Assemblers (mainly farm products), of which there were 29,122 in 1939, include: assemblers; commission buyers; co-operative marketing associations; co-operative sales agents; cream stations; country grain elevators; and packers and shippers.

The census of business shows in great detail the extent to which each of these types of wholesale institutions is important for different industries and for different types of products. Every producer or manufacturer finds that one of his chief problems is to decide which of these wholesale institutions or what combination of wholesale institutions will serve him best. The great divergence in methods of operation is partly a reflection of the differences among the markets to be served and partly a reflection of individual decisions by many different business managements.

In addition to the types of marketing institutions already described, there are also the marketing departments of manufacturers or producers, which are not included among the manufacturers' sales branches. Many manufacturers notably those with limited geographical coverage or those who sell to a few large customers, have no need for sales branches and operate entirely from the factory or central office.

In addition, there are a great many marketing institutions which might be described as facilitating organizations. Advertising agencies which prepare and supervise advertising programs for their clients are prominent among these. There are also a growing number of specialized marketing research organizations which undertake to secure facts, by survey or otherwise, as to the size and character of the market for a particular product, the best type of outlets to be used, and other factors affecting marketing decisions. In a very real sense, magazines, newspapers, and radio stations are also facilitating marketing institutions because of their importance in sales promotion activities.

Integration of Marketing Functions

When a single enterprise carries out all of the activities involved in moving goods to final buyers, it may be described as having integrated all of the marketing functions. An example of thoroughgoing integration, not only of marketing activities but also of production activities, is found in the petroleum industry. Many of the concerns in the petroleum industry own oil wells, pipelines and other transport facilities for moving crude oil to refineries, refineries themselves, tankers or other transportation equipment for moving the refined product to market, and wholesale and retail marketing facilities. As another example, some manufacturers of men's clothing own and operate chains of retail stores to sell their products, and the products of other manufacturers to men.

The integration of marketing functions may be complete or partial. Grocery chains, for instance, often perform what may be described as both wholesale and retail functions. They maintain large warehouses to which goods are shipped direct from manufacturers or processors in very large quantities. These large quantities are broken down at the chain warehouses into smaller quantities and shipped to the individual retail stores, usually by truck. In other words, there has been partial integration of the marketing functions but not the complete integration which would have developed if the same interests owned both the manufacturing and the chain store organization.

A different type of partial integration is found when a manufacturer or producer sets up his own sales branches with stocks of merchandise and sells from these branches to retailers. In this case, the integration has extended through the wholesale functions but has not included the retail functions. The working out of integration to the most effective degree, taking into account not only internal costs but also sales promotion factors, is an outstanding marketing problem.

New Combinations of Merchandise.—Another important problem which concerns many types of marketing institutions is the working out of new combinations of merchandise to be carried. A special aspect of merchandising activity, as described above, has featured extensive experimentation in the combinations of merchandise carried by particular kinds of wholesale or retail institutions. A notable illustration is the development of modern drugstores, many of which, starting with a relatively clear-cut line of pharmaceuticals, have expanded to include a wide range of toys, household appliances, cosmetics, tobacco products, and even some types of clothing. Most drugstores are much like old-fashioned general stores or modern department stores. In the grocery chains, there was much discussion during the 1920's about the addition of meats and fresh fruits and vegetables to the line; this development is now firmly established. Filling-station chains, several of which are operated by large tire manufacturers, are tending to broaden their lines markedly, almost to the point of becoming small department stores.

During the last two or three decades there have been, however, some developments in the opposite direction—toward narrower specialization. In the shoe trade, for instance, some concerns have specialized not only in men's shoes or even in men's shoes at a single price. Perhaps the extreme in such specialization was the opening in a large city of a store devoted entirely to the sale of men's neckties.

The Automobile and Marketing.—During the years following the First World War, one of the most powerful influences for change in retail trade practices was the increasing use of the automobile. To this cause can be traced the rising importance of large trade centers and the decline in the trade of smaller communities in rural areas—and also the movement of retail trade to outlying sections of larger cities where parking space is available. With the location of the new stores of the two major mail-order companies (Sears Roebuck & Company, Montgomery Ward & Company) in outlying sections, as compared to downtown shopping areas, and the development of large food stores, commonly called supermarkets, wherever parking space can be found, it seems highly probable retail trade has not yet felt the full effects of the increased mobility of customers resulting from the use of the automobile.

Marketing Costs.—As already noted, marketing costs represent somewhat more than half, perhaps between 54 per cent and 59 per cent, of the total cost of producing and distributing goods. Increasing perception of this fact has caused considerable concern about the problem of high distribution costs. Two observations in regard to this problem are worth citing: (1) Distribution costs have in part replaced production costs. Economies flowing from large-scale manufacture, and from the technical developments that it has been possible to utilize in large-scale operations, have greatly lowered the costs of producing goods; but at the same time increased marketing costs have resulted from the attempt to dispose of larger outputs in wider markets. (2) The high cost of distribution, as Professor F. W. Taussig once remarked, is to a considerable extent the price of consumer freedom—freedom to make choices from a great variety of goods, both in and out of season, freedom to gratify whims; freedom to return merchandise merely because of a change of mind; freedom to enjoy all kinds of collateral services, including credit, delivery, mail orders, telephone orders, demonstrations, lectures, fashion shows, and so on."[6]

These observations do not, of course, imply that intensive efforts should not be made by business management and by public authorities to reduce marketing costs. Indeed, the large proportion of total costs devoted to marketing represents an opportunity and a challenge, since the general potential standard of living can be greatly affected by efforts in this direction. Overall estimates of aggregate marketing costs do not serve particularly well for this purpose. What is needed is detailed information as to the costs incurred by particular types of marketing institutions.

The study of marketing costs really began some 30 years ago when the Harvard Bureau of Business Research, a division of the Harvard Graduate School of Business Administration, published its first study of the operating costs of shoe retailers. Since that time, the Harvard bureau and many other educational and trade institutions have published typical figures for operating costs of many retail and wholesale trades. The census of business has provided additional information, and there are few wholesale and retail trades for which at least some information about typical operating costs is not available. A compendium of such studies, not only for the United States but for European countries, has been published by members of the faculty of the Harvard Graduate School of Business Administration.

Published material on marketing costs of manufacturers, by contrast, is very scanty and is largely limited to a study in 1933 by the Association of National Advertisers,[7] a study by the Twentieth Century Fund entitled *Does Distribution Cost Too Much?*[8] and a study of some 15 industries by the Federal Trade Commission.[9]

Marketing Research.—There has been a notable increase in interest in marketing research. In a sense, any effort to secure facts or to correlate known facts in an orderly fashion in order to provide a rational basis for marketing decisions is marketing research. Over the years most successful enterprises have, therefore, been engaged in marketing research. Business firms, advertising agencies and publishers, and specialized marketing research organizations have also been developing a considerable body of specialized techniques which warrant particular attention.

As has been noted already, the marketing of most consumer goods is characterized by far-flung markets, with producer and consumer

---

[6] McNair, Malcolm P., Teele, Stanley, F., Mulhearn, Frances G., (with the collaboration of Dr. Julius Hirsch) *Distribution Costs, An International Digest*, p. 2 (Graduate School of Business Administration, George F. Baker Foundation, Harvard University, Boston 1941).

widely separated as to time and place. Some manufacturers of industrial goods and a few small manufacturers of highly specialized consumer goods have such a small number of potential customers that information about these potential customers may be secured by a direct, complete canvass or census. But for mose sellers the number of potential customers renders it physically and financially impossible to make a complete canvass. Under these conditions, the techniques of "sampling" become important. Essentially, the use of "sampling" rests on the proposition that results obtained from studying a properly selected sample will be representative of the whole.

An important question in radio advertising is the number of listeners for particular programs. A method has been devised whereby a careful, calculated sample of people in certain cities is telephoned and asked what program is being heard. From these replies the relative popularity of different programs is calculated. Critics of this method point out that the sample is composed only of people in cities and only of those in the income group who have telephones. If this is the total group with which the marketer is concerned, the kind of sample is adequate; if, on the other hand, the marketer is interested in a cross section of the entire population, there are very important segments unrepresented in such a sample. To meet this difficulty a device has been developed which is attached to the radio and records on a tape the exact times the radio is turned on and the stations to which it is tuned. The user of this device seeks to have it attached to radios in homes which are carefully selected to be fully representative of the entire population, taking into account such factors as geographical distribution, racial characteristics, income levels, and urban and rural differences.

The question of the popularity of particular radio broadcasts is illustrative of problems calling for continuing information. The readership of magazines (circulation is not a complete nor accurate measure of the number of actual readers) and the movement of particular brands of goods through grocery and drugstores are other illustrations of questions which receive continuing study by one means or another.

More often a marketer needs facts to help reach a specific nonrecurring decision. The problem may be the desirability of a particular change in a package, the use of a specific kind of advertisement or other promotional piece, or the determination of the size and character of a market, either nationally or in some smaller regional unit.

For securing information on these and a host of other questions many techniques have been developed and are used. One technique is direct observation. Observers, for instance, are stationed in liquor stores to hear and record just what happens during a transaction. How does the customer ask for merchandise? In how many instances does he ask for a specific brand of merchandise? How often does he mention price first? How often is he influenced by large special displays? The salesman, knowing of the observer's presence, may not act naturally, but the behavior of the customer is likely to be significant.

A second frequently used technique is the interview. Interviews are held in homes, on subways or other public transportation, in offices, and indeed wherever people can be induced to talk. Usually the interviewer is guided by a carefully prepared questionnaire or series of questions which is designed to bring out the information desired and to guard against false or mistaken answers.

Both the preceding methods are expensive, since they require the time of an observer or interviewer for each observation or reply. Their high cost is a major factor which has lead to the very great use of mail questionnaires. Such questionnaires have become a popular butt for jokes, and in some instances they have been so poorly constructed or handled that the results have little or no validity. A great deal of experience on the construction of questionnaires has now been accumulated, however, and it should be possible to avoid the most egregious errors. Even after careful attention to the advance construction of questionnaires, experienced marketers conduct small-scale trial runs before using a particular questionnaire on a broad scale.

The careful planning of a survey in advance, including the exact definition of the information (facts or opinions) to be sought, the determination of the methods to be used in securing information, and the handling of mass data after it has been secured, is an essential to effective and low-cost marketing research. Much refinement of techniques is now in progress and those refinements will make possible more precise measurements, but the best techniques are of little value if the basic planning in terms of objectives is not carefully and skillfully done.

The Government and Marketing

As an important part of business as a whole, marketing is, of course, affected by all federal and state legislation which deals with business activities. The present tax structure, for insurance, affects marketing decisions as much as it effects decisions about production. There are, however, a number of important pieces of legislation which are primarily concerned with marketing activities. Among these may be mentioned the Pure Food and Drug Act as amended, the Federal Trade Commission Act establishing the principal federal agency which regulates marketing activities, and the statutes providing for the registration of trademarks. Important basic state legislation includes the uniform sales acts and many laws designed to prevent fraud and misrepresentation in sales transactions.

During the last decade there has been a considerable legislative movement related to the regulation of prices. These legislative enactments are sometimes lumped together under the heading "Fair Trade Legislation." The Clayton Act, passed many years ago in conjunction with the Federal Trade Commission Act, made a start toward limiting pricing freedom by forbidding discrimination among different localities designed to eliminate competition. In the middle 1930's this limitation was extended by the so-called Robinson-Patman Act, which provided, "That it shall be unlawful for any person engaged in commerce, in the course of such commerce, either directly or indirectly to discriminate in price between purchasers of commodities of like grade and quality. . . ." This act includes a series of specific exceptions to the basic rule against discrimination, the most important of which is, "That nothing herein contained shall prevent differentials which make only due allowance for

ifferences in the cost of manufacture, sale, or elivery resulting from the differing methods or uantities in which such commodities are to such urchasers sold or delivered. . . ."[10]

A second major piece of legislation limiting ricing freedom was the Miller-Tydings Act hich permitted the states to enact legislation roviding for resale price maintenance. Under uch state enactments, manufacturers are permitted to require wholesalers and retailers to esell their merchandise at or above prices stipuated by the manufacturer. State legislation of his nature has been generally adopted, and resale rice maintenance contracts have been widely mployed, especially by manufacturers of drugs, oods, and alcoholic beverages.

A companion approach to the control of selling prices is typified by the California Unfair Practices Act, which prohibits sales below cost. A number of states have adopted this type of egislation and have defined cost variously, several setting a percentage above the price paid y the retailers or wholesalers to cover the distributors' operating costs.

During the Second World War, the federal overnment's control of marketing was very xtensive, not only through the prohibition f production of certain goods, but also through ationing and direct price control. Under these onditions, marketing managements have often ad to be guided much more by government egulations than by an analysis of business circumstances.

Bibliography.—The reader seeking more detailed information on marketing will find that he literature numbers hundreds of volumes nd that dozens of magazines are constantly ublishing articles on the subject. From these any sources, a few have been selected. They re classified below as to whether they are oncerned with marketing generally or some nportant subdivision of the subject. In addion, a few of the current magazines are listed:

GENERAL: Copeland, Melvin T., *Principles of Merchandising* (New York 1924); Maynard, H. H., Weidler, W. C., and Beckman, T. U. *Principles of Marketing* (New York 1932); Converse, Paul D., *Elements of Marketing* (New York 1935).

SPECIAL ASPECTS OF MARKETING: Weld, L. D. H., *The Marketing of Farm Products* (New York 1916); Todsdal, Harry R., *Principles of Personal Salesmanship* (Chicago 1927); Nystrom, Paul H., *Economics of Fashion* (New York 1928); Fredrick, John H., *Industrial Marketing* (New York 1934); Elder, Robert F., *Fundamentals of Industrial Marketing* (New York 1935); Brown, Lyndon O., *Market Research and Analysis* (New York 1937); Nixon, Howard K., *Principles of Advertising* (New York 1937); American Marketing Association, *The Technique of Marketing Research* (New York 1937); Brisco, Norris A., and Wingate, John W., *Elements of Retailing Merchandising* (New York 1938); Finkelhor, Francis, *Legal Phases of Advertising* (New York 1938); Vaile, Roland S., and Canoyer, Helen G., *Income and Consumption* (New York 1938); Twentieth Century Fund, *Does Distribution Cost Too Much?* (New York 1939); Lewis, Howard T., *Industrial Purchasing, Principles and Practice* (Chicago 1940); Duncan, Delbert J., and Phillips, Charles F., *Retailing Principles and Methods* (Chicago 1941); McNair, Malcolm P., Teele, Stanley F., and Mulhearn, Frances G., *Distribution Costs, An International Digest* (Boston 1941); Borden, Neil H., *The Economic Effects of Advertising* (Chicago 1942).

STANLEY F. TEELE,
Professor of Business Administration, Graduate School of Business Administration, Harvard University.

MARKETS AND RURAL ORGANIZATIONS, Office of. See AGRICULTURE, DEPARTMENT OF.

MARKHAM, märk'ăm, **Albert Hastings,** English admiral and Arctic explorer, cousin of Sir Clements Markham (q.v.): b. Bagnères, Nov. 11, 1841. He entered the navy in 1855, saw active service in the China seas for several years, took part in the Polar expeditions of Adams (1873) and of Nares (1875), and in the latter expedition attained what was then the farthest north, 83° 20′ 26″. With Sir Henry Gorn-Booth he attempted to reach Franz Joseph Land in 1879, but was unsuccessful; in the next year Markham explored the Galapagos Islands. Rear admiral in 1892 and second in command of the Mediterranean Fleet in 1893, he was made a vice admiral, and later admiral. His last command was at Nore. He retired in 1906. He wrote *The Cruise of the Rosaria Amongst the New Hebrides* (1873); *The Great Frozen Sea* (1878); *The Voyages and Works of John Davis* (1884); *A Polar Reconnaissance* (1879); and *Life of Sir John Franklin* (1891). He died Oct. 28, 1918.

MARKHAM, Sir Clements Robert, English geographer and traveler: b. Stillingfleet, Yorkshire, July 20, 1830; d. Jan. 30, 1916. He was educated at Westminster School, entered the navy in 1844, accompanied the Franklin Search Expedition of 1850 and then retired from the service. He traveled in Peru in 1852–54 and 1860–61, the second journey being undertaken to get cinchona seeds for planting in India, an experiment described in his *Peruvian Bark; Cinchona Culture in British India, 1860–1880* (1880). After spending 1865–66 in Ceylon and India, he became assistant secretary in the India Office from 1867–77, and curator of its geographical department in 1868. From 1858–87 he was secretary of the Hakluyt Society, of which he became president in 1890. From 1863–88 he was secretary of the Royal Geographical Society, and in 1893 became its president. His more important works, several of which were translated into German, are *Cuzco and Lima* (1856); *Travels in Peru and India* (1862); *The Arctic Navy List* (1875); *Lives* of Columbus, John Davis, Richard Hakluyt, Lord Fairfax, Major Rennell and Sir Leopold McClintock; *Quichua Dictionary* (1908); *The Incas of Peru* (1910). He rendered distinguished service to the history of geography and discovery by editorial work for the Hakluyt and other societies. He was created Knight Commander of the Bath in 1896.

MARKHAM, Edwin, American poet: b. Oregon City, Oreg., April 23, 1852. He spent his

[10] An act to amend section 2 of the act entitled "An act to supplement existing laws against unlawful restraints and monopolies, and for other purposes," approved Oct. 15, 1914, as amended (U.S.C., title 15, sec. 13), and for other purposes.

boyhood on a ranch in central California, herding cattle and sheep, and later graduated from the California State Normal School at San José and from Santa Rosa College. He studied law, but did not practice; subsequently took up educational work and was superintendent and head master of schools in California and principal of the Observation School of the University of California in Oakland. He had for some time been an occasional contributor to some of the leading American magazines, but first gained wide reputation through the publication of his poem, *The Man with the Hoe,* suggested to him by Millet's picture of the same name. This first appeared in the San Francisco *Examiner* and was later published in a collection entitled *The Man with the Hoe and Other Poems* (1899). This poem, which had a wide influence and caused much discussion, is intended by the author not merely as a picture of the peasant but as "a symbol of the toiler brutalized through long ages of industrial oppression." His other publications include *Lincoln and Other Poems* (1901); *The Poetry of Jesus* (1914); *California the Wonderful* (1914); *The Children in Bondage* (1915); *Remarkable Writings of Thomas Lake Harris,* 5 vols. (1918); *Gates of Paradise* (1920); *The Ballad of the Gallows Bird.* Died S. I., New York, March 7, 1940.

MARKHAM, Gervase (or **Jervis**), English poet and writer: b. 1568?; d. London, Feb. 3, 1637. A soldier of fortune in the Low Countries and later a captain under the earl of Essex in Ireland, Markham is remembered as a writer on horse-breeding, agriculture and forestry. He is said to have imported the first Arab into England for stud purposes. His *Poem of Poems* or *Syon's Muse* (1595) was dedicated to Sir Philip Sidney's daughter. He collaborated in writing two plays, and was the author of *A Discourse on Horsemanshippe* (1593), as well as numerous works on husbandry.

MARKHAM, William, English colonial governor in America: b. England, about 1635; d. Philadelphia, June 12, 1704. When William Penn obtained a charter for Pennsylvania, he made Markham, a first cousin of his, his deputy. Markham had all rights granted to Penn save that of convoking a legislative assembly. On Aug. 3, 1681 he established a council, later chose the site for Philadelphia and conferred with Lord Baltimore as to the Maryland-Pennsylvania boundary. Penn himself arrived on Oct. 27, 1682, and Markham, whose commission accordingly lapsed, was elected to the council. In 1684–99 he was secretary to the province, in 1686 became land commissioner and in 1689 an auditor of accounts. When in 1691 the territory now constituting the State of Delaware was detached from the province, he was appointed its deputy governor, and in 1694–99, as lieutenant governor, administered both this territory and the province.

MARKHOR, mär'kôr or -koor, a remarkable goat (*Capra falconeri*) of the mountains of Afghanistan and northwestern India, where it keeps among the highest wooded valleys, ascending and descending only as compelled to do so by the seasonal changes in the depth of the snow. It is of large size, standing about three feet tall at the shoulders, and is reddish-brown in summer and light gray in winter. "The magnificent beard, extending in the adult males on to the chest and shoulders, and sometimes reaching nearly to the knees, is black in front and gray behind; in the young bucks and the does at all ages it is confined to the chin." The horns are very different from those of other goats, rising straight up from the forehead, spreading sideways, so as to form a V when seen from in front, and spirally twisted. Specimens have measured 50 inches along the spiral keel. Several distinct local varieties of markhor are known to the Himalayan hunters, who regard this animal as one of the most excellent objects of sport in that region of prime game animals. "Unlike the ibex, which keeps to the rugged crags and steep ravines above the limits of the forest, the markhor delights in rocky forests, and although it occasionally comes out into the open glades, it seeks concealment as much as possible." Hence its hunting calls for the greatest skill as well as endurance. This goat is often captured, tamed and crossed with domestic goats; and it is believed to have had some influence in originating the Angora breed. Consult Lydekker, *Wild Oxen, Sheep and Goats of All Lands* (1898).

MARKIEWICZ, Countess, Irish artist and revolutionist: b. Lissadel, Sligo, Ireland, about 1868. A daughter of the late Sir Henry Gore-Booth, closely connected with a number of English titled families, she has been described by the Dublin bourgeoisie as the stormy petrel of Dublin life. Her husband, a Pole, was employed in the Russian consular service, and both had been prominent figures in the social life of Dublin. Before the countess became involved with the Sinn Fein Party she had made a name both as an artist and an actress, and she had frequently acted in her husband's plays at the Abbey Theatre. As a young girl the countess, then Miss Constance Gore-Booth, was presented at court and spent several seasons in London, after which she went to Paris as an art student. She came into prominence during the election in Northwest Manchester in 1908 as an opponent of Mr. Churchill. The Licensing Bill was then the issue and she went to Manchester to plead the cause of the barmaids. Her sister, Miss Eva Gore-Booth (q.v.), a leading English suffragette, was then the secretary of the Barmaids' Political Defence League. In 1911 the countess was charged in Dublin with assaulting a policeman at the breaking-up of a Socialist meeting. During the labor troubles in Dublin in 1912 she came into conflict with the police on several occasions. On the memorable Sunday at the end of August 1912 when Larkin's dramatic arrest was the prelude to wild disorder in O'Connell Street, she and her husband came upon the scene when the excitement was at its height, and as Larkin was being escorted to the police station by a body of police with drawn batons. The countess stood up on the car she was driving and led the cheers of the mob for the captured labor leader. For many months afterward, when a large section of the Dublin working classes was in dire poverty caused by the protracted strikes, the countess was a constant attendant at Liberty Hall, the headquarters of the Transport Workers' Union. Here she was engaged in preparing and distributing meals to

the impoverished wives and families of the strikers. A few weeks before the abortive revolution in April 1916 her house was raided by the police, who found a printing plant there and many documents. At the outbreak of the revolt she apparently accompanied the party who captured Saint Stephen's Green, and when the troops got the upper hand she retired with her detachment into the Royal College of Surgeons, one of the principal buildings on the green. Eventually she hoisted the «white flag» and intimated that she would surrender at noon. At the appointed hour the countess marched out of the college, followed by 120 rebels walking two abreast. She was dressed entirely in green, with green tunic, green hat with green feather, green putties and green shoes. She marched to where the opposing force was waiting and, going to the officer in command, saluted, kissed her revolver and handed it over with her bandolier, and announced that she was ready. The men were disarmed and marched off under armed escort to the castle. For complicity in the uprising the countess was sentenced to death by a court-martial, the sentence being afterward commuted to imprisonment for life. She was liberated with the other Irish prisoners in June 1917. She continued her activity in the Sinn Fein party, however, and at the general elections held in December in 1918 she was elected to Parliament, the first woman to be so honored, but she declined to serve. Thereafter she was a leader in Irish Republican circles, opposed to the Free State. She died at Dublin, 15 July 1927.

MARKING-NUT, an East Indian tree (*Semecarpus anacardium*) of the cashew family, having a fruit the receptacle of which is roasted and eaten. The black juice of the unripe fruit serves with quicklime to make an indelible marking-ink.

MARKINGS OF ANIMALS. See Coloration, Protective.

MARKLE, John, American coal operator: b. Hazelton, Pa., 15 Dec. 1858. He was graduated in the mining engineering department of Lafayette College in 1880 and in the same year was appointed general superintendent of mines of G. B. Markle and Company, his father's firm. Upon his father's death he succeeded him and was president of the G. B. Markle Company, successor to G. B. Markle and Company, and one of the largest of the «independent» companies in the anthracite coal industry and also president and chief engineer of the Jeddo Tunnel Company. He was one of the leading figures and represented the independent operators in the negotations with President Roosevelt and in the inquiry by the President's commission in connection with the anthracite coal strike of 1902. Mr. Markle was a director of the Industrial Finance Corporation, the Morris Plan Company of New York, member of the American Institute of Mining Engineers, the New York Chamber of Commerce and Franklin Institute, Philadelphia, and a trustee of Lafayette College. He died 10 July 1933.

MARKOE, Thomas Masters, American surgeon: b. Philadelphia, Pa., 1819; d. 1901. In 1836 he was graduated at Princeton and in 1841 at the New York College of Physicians and Surgeons. He was appointed to the chair of anatomy in Castleton Medical College, Vermont; in 1852–54 was professor of pathological anatomy at the medical department of the University of the City of New York. He was appointed adjunct professor of surgery at the New York College of Physicians and Surgeons in 1860; became full professor 10 years later and in 1879 was appointed to the chair of the principles of surgery. He published 'Treatise on Diseases of the Bone' (1872).

MARKS' MILLS, Engagement at. On 23 April 1864, a train of 240 wagons, escorted by 1,200 infantry, 400 cavalry and five guns, all under command of Lieut.-Col. F. M. Drake, 77th Ohio Infantry, left Camden, Ark., for Pine Bluff, to get supplies for General Steele's army, then co-operating with Banks' Red River expedition. At 10 A.M. of the 25th, when at Marks' Mills, on the Camden and Pine Bluff road, about eight miles beyond Saline River, Drake was attacked, front and rear, by General Fagan's force of 3,000 men — cavalry, mounted infantry and two batteries — and after a hard fight of more than three hours, during which Drake was severely wounded and had lost 250 in killed and wounded, the entire train, guns and the greater part of the cavalry and infantry were captured. About 300 escaped and made their way to Little Rock and Pine Bluff. Incomplete Confederate returns show a loss of 41 killed, 108 wounded and 144 missing. Fagan's entire loss was about 420. When Steele heard of the disaster he immediately abandoned the idea of joining Banks, left Camden on the night of the 26th for Little Rock, was followed by Sterling Price, had a rear-guard fight at Jenkins' Ferry on the 30th and continued his retreat to Little Rock. Consult 'Official Records' (Vol. XXXIV).

E. A. Carman.

MARL, a mixture of carbonate of lime and clay in various proportions. If the lime predominate the marl is called calcareous; clay marl, or argillaceous marl, has a larger proportion of clay. As marl is hard or not it is called indurated or earthy. Even the more solid marls crumble soon on exposure to the atmosphere, and form a paste if dipped in water; they effervesce in acids, because of the presence of carbonate of lime. Marl occurs in masses and beds, is associated with chalk, gypsum, sand, clay or compact limestone and contains important fossil remains. To the presence of carbonate of lime in its composition, marl owes its use in the manufacture of Portland cement and as a fertilizer. Many natural mixtures used as manures are called marls, such as the New Jersey green sand-marls, which contain as their principal constituents clay and greensand and usually only 1 or 2 per cent of carbonate of lime. The latter use of the word is scarcely justifiable, especially as it is sometimes applied, notably in England, to substances containing no lime at all. Marl is accumulating at the present time in many lakes in the glaciated areas of our Northern States, in part as a result of the grinding up of small shells, in part as a result of the activity of algæ known as chara, which cause the deposition of lime carbonate. Marl may sometimes be a direct chemical precipitate. See Mineral Production of the United States.

MARLATT, Charles Lester, American entomologist: b. Atchison, Kans., Sept. 26, 1863. He was educated at Kansas State College of Agriculture and Applied Science, receiving his B.S. degree in 1884 and his M.S. in 1886, and taught there for two years. From 1889 to 1894 he was assistant entomologist, from 1894 to 1922 first assistant and assistant chief entomologist, from 1922 to 1927 associate chief, and from 1927 to 1933 chief, of the Bureau of Entomology of the United States Department of Agriculture. Marlatt directed efforts to secure a federal law to prevent the importation of infested and diseased plants, which resulted in the passage of the Plant Quarantine Act of Aug. 20, 1912.

MARLBORO, märl'bûr-ō, unincorporated village, New York, situated in Ulster County, at an altitude of 180 feet, on the west bank of the Hudson River and the New York Central Railroad, 8 miles north of Newburgh. In a fruit-growing and dairying region, it has canneries, dairies, and factories producing builders' supplies. Marlboro was the home of Frederic W. Goudy (q.v.), type designer. Pop. (1950) 1,709.

MARLBOROUGH, märl'bŭ-rŭ, 1st Duke of (John Churchill), English soldier and statesman: b. Ashe House, near Musbury, Devonshire, 1650; d. near Windsor, June 16, 1722. He attended St. Paul's School from 1663 to 1665, when he became page to the duke of York (later James II). Commissioned an ensign in 1667, he saw service at Tangier, and in 1672 was promoted to the rank of captain. In that year he accompanied the duke of Monmouth to Flanders in the expedition to assist the French against the Dutch. He distinguished himself at the siege of Maastricht in 1673, and in the following year was commissioned colonel by Louis XIV. Returning to England, he was married to Sarah Jennings, attendant of Princess (later Queen) Anne, early in 1678, and was commissioned colonel of a foot regiment. He accompanied the duke of York to the Netherlands in 1679, and later that year to Scotland. In 1682, he was created Baron Churchill of Aymouth. In the following year his wife was appointed lady in waiting to Princess Anne, with whom she became intimate. On the accession of James II in 1685, he was sent on a mission to Louis XIV and soon after his return was created Baron Churchill of Sandridge. He helped to suppress Monmouth's rebellion and was raised to the rank of major general.

He was in touch with William of Orange as early as 1687, and he joined him in the following year. Early in 1689, William appointed him a member of the Privy Council and raised him to the earldom of Marlborough. He served in Ireland in 1690, reducing Cork, Kinsale, and other towns. Suspected of intrigue with the Jacobites, he was dismissed from his positions in 1692 and committed for a short time to the Tower of London. By 1698, however, he was restored to favor at court and was appointed governor to the young duke of Gloucester and member of the Privy Council. In 1701, William appointed him commander in chief of the English forces in the Netherlands and ambassador plenipotentiary at The Hague.

On the accession of Queen Anne in 1702, Marlborough was appointed captain general of the forces in England and master general of ordnance. He was sent to The Hague as ambassador extraordinary and arranged for English support of the Dutch in the War of the Spanish Succession. In command of a mixed force of English, Dutch, and Germans, he drove the French from Upper Gelderland and took Kaiserwerth, Venlo, and Liége. For his services he was created marquis of Blandford and duke of Marlborough. He returned to the Continent in 1703, campaigned successfully in the Rhineland, but was unable to take Antwerp because of the lack of Dutch support. In the following year he stormed the French and Bavarian lines at Donauwörth and, with Prince Eugene of Savoy, won the great victory of Blenheim (August 13). Parliament showed its gratitude by passing an act enabling the queen to award him the manor of Woodstock, and Blenheim Palace was built for him at her expense. He was victorious over the French at Ramillies in 1706, and at Oudenarde, with Prince Eugene, in 1708. In the following year he defeated the duc de Villar at Malplaquet, though at a cost ill repaid by the capture of Mons. Meanwhile, his popularity at court had declined and a new ministry, hostile to him, had taken office. He was accused of using public funds for private purposes and dismissed from his command in 1711. He went in disgust to the Netherlands in 1712, but returned to England in 1714, on the death of Queen Anne, and shortly thereafter was reappointed captain general and master of ordnance.

Consult Murray, George, ed., *Letters and Despatches of Marlborough,* 5 vols. (London 1845); Coxe, William, *Memoirs of the Duke of Marlborough,* rev. ed. (London 1847–48); Churchill, W. L. S., *Marlborough, His Life and Times,* 6 vols. (New York 1933–38); Ashley, M. P., *Marlborough* (London 1939).

MARLBOROUGH, municipal borough, England, situated in Wiltshire, in the Kennet River valley, 75 miles west of London. It serves as the trading center for the surrounding dairying and sheep-raising region. The borough is the seat of Marlborough College, a public school founded in 1843. Thomas Cardinal Wolsey is said to have been ordained at St. Peter's Church here in 1498. Pop. (1951) 4,556.

MARLBOROUGH, märl'bûr-ō, city, Massachusetts, situated in Middlesex County, at an altitude of 375 feet, on the Boston and Maine and the New York, New Haven and Hartford railroads, 15 miles east-northeast of Worcester. An industrial city, it produces shoes and slippers, paper goods, metal products, boxes, and miners' lamps. It has a public library, a museum of natural history, and a general hospital. In the building used as the headquarters of the American Legion is the John Brown Bell, taken from the engine house at Harpers Ferry in 1861 by Union soldiers from Marlborough.

Marlborough occupies the site of an Indian settlement. The first white settlers arrived in 1657, and three years later a town was incorporated and named for Marlborough, England. It was attacked by the Indians in 1676, in King Philip's War, while the townspeople were at church. Marlborough was incorporated as a city in 1890. It is governed by a mayor and council. Pop. (1950) 15,756.

MARLBOROUGH, provincial district, New Zealand, situated in the northeastern part of South Island. Its extreme length is 130 miles,

breadth 60 miles; area, 4,220 square miles. The coast is deeply indented by bays and natural harbors, from which the hills rise abruptly, clothed with magnificent forests. The district is generally hilly or mountainous, with splendid scenery. The amount of arable land is restricted; in the south are the Wairau plains, one of the finest sheep tracts in New Zealand. Mining is carried on, gold, copper, and coal being found. Blenheim, the capital, is connected by rail with the seaport of Picton on Queen Charlotte Sound, an inlet off Cook Strait. Pop. (1945) 20,737.

MARLIN, mär'lĭn, city, Texas, seat of Falls County, located near the Brazos River at an altitude of 383 feet, 20 miles south-southeast of Waco, on the Southern Pacific and the Missouri Pacific railroads. It is situated in an agricultural region in which cotton is the principal product, and the ginning and compressing of cotton is the city's leading industry. Cottonseed oil is produced and shipped. Other shipments are mineral crystals, dressed poultry, and creamery products. With three hot-water artesian wells having remarkable curative properties, Marlin stands high as a health resort, and is visited by persons from all parts of the country. There are two general hospitals and a veterans hospital here. The city has good schools, a public library, and a courthouse. Government is by mayor and council. Pop. (1950) 7,099.

MARLINESPIKE, mär'lĭn-spīk, **MARLINSPIKE,** or **MARLINGSPIKE,** an iron pin tapering to a point, and principally used by sailors to separate the strands of a rope in splicing or knotting. The name is often applied to the jaeger because of the bird's long middle tail feathers.

MARLITT, E. See JOHN, EUGENIE.

MARLOW, mär'lō, city, Oklahoma, in Stephens County, on a tributary of the Washita River, 26 miles east of Lawton, served by the Chicago, Rock Island, and Pacific Railroad. Corn and watermelons are raised in the county, and there are cotton gins in the city. Pop. (1950) 3,399.

MARLOWE, Christopher, English poet and dramatist: b. Canterbury 1564; d. Deptford, June 1, 1593. In 1584 he took the A.B. degree at Corpus Christi College, Cambridge, and in 1587 the degree of M.A. Perhaps in the same year, the first part of his *Tamburlaine* was acted in London; and the rest of his life was spent in active connection with the theaters. His life seems to have been somewhat dissipated and the daring of his theological opinions gave color to an accusation of atheism. In 1593 he was killed in a tavern broil by Ingram Frisar, and was buried at St. Nicholas, Deptford.

Numerous plays have been assigned to Marlowe, including a share in the three parts of *Henry VI;* and he may very likely have had some part in others besides the following, which can with certainty be ascribed to him: *The Tragedy of Dido,* of uncertain date of acting, finished by Thomas Nash, printed 1594; *Tamburlaine the Great* (two parts), acted 1587–1588, printed 1590; *Tragedy of Dr. Faustus,* acted 1588–1589, entered at Stationer's Hall 1601; *The Jew of Malta,* acted after 1588, entered 1594, printed 1633; *Edward II,* acted 1591, printed 1593; *The Massacre of Paris,* acted 1593, printed about 1600. His *Hero and Leander* was completed after his death by George Chapman and published in 1598. Marlowe's plays attained a sudden and great popularity and his poetic reputation is testified to by numerous tributes from his contemporaries. Marlowe's dramatic activity came at a time of great emotional stir and stress. In England the ideas and ideals of the Renaissance and the Reformation had finally gained the ascendency over those of the Middle Ages. The struggle with Spain, which was just ending in the destruction of the Armada, had brought a triumphant consciousness of national greatness. From this newly-discovered England as well as from the newly-discovered America and the rediscovered world of Greece and Rome, came countless incentives for multiform activities. The drama had already become in some measure an expression of this national activity, but it still awaited the services of great literary genius. After two generations of precarious struggle, the professional companies had become firmly established in the public theaters and it was already plain that the main development of the drama was henceforth to be popular and professional rather than scholarly and amateur. In comedy, indeed, the plays of John Lyly and George Peele had already supplied refinement and a literary flavor, but in the popular drama in the main, and in tragedy in particular, there was neither refinement nor poetry.

Marlowe created English tragedy anew. He threw aside Senecan traditions and devoted himself to meeting the demands of the London theaters, but the prologue to his first play was a declaration of reform, announcing the adoption of blank verse, heroic themes and "high astounding terms." His themes were novel, and his treatment of them seems to have been dictated by a conception of tragedy formed independently of his predecessors—the heroic struggle of a great personality doomed to inevitable defeat. *Tamburlaine* is hardly a tragedy at all but rather a chronicle of the hero's greatness; but in *Dr. Faustus* and *The Jew of Malta,* heroes with ambitions as boundless and passionate as Tamburlaine's are overwhelmed in the end by the limitations that forever bound human aspiration. These plays mark the formation of the Marlowean type of tragedy, often imitated and long influential in the English drama. A protagonist distinguished by great passions and many crimes absorbs the interest of a series of scenes, brutal and sensational, full of violent action, ranting declamation, bloodshed, and villainy affording opportunity for elaborate theatrical spectacles and adorned by passages of profound intellectual suggestiveness and extraordinary beauty of diction and melody. *Edward II,* the most mature of his plays, illustrates these characteristics and also testifies to his growing power both as a playwright and as a poet. The characterization is less melodramatic, more varied and more human than in the earlier plays; the structure more coherent and organized; the style less bombastic, more even and more dramatic. Shakespeare, who clearly imitated Marlowe in *Richard III* and produced *Richard II* in rivalry of *Edward II* did not in these two plays surely surpass his master.

Marlowe's faults and deficiencies are apparent and they cannot all be credited to the

immaturity and experimental nature of his art. The banalities that mar his noblest scenes and the absurdities that appear in every phase of his work, theatrical, dramatic or poetic, would doubtless have disappeared in the rapid development of dramatic art which the next 30 years witnessed. But there are no indications that, had Marlowe's life been prolonged, he would ever have excelled in humor or the individualization of character. His achievement is, nevertheless, among the most remarkable and enduring of the Elizabethan era. His poetry remains forever impressive with its fine impetuosity, its splendors of diction and melody. His tragedies, of immense influence on the theater of his day, continue to rank among the greatest of English literature in their expression of passionate ambition and aspiration. He was the first great English dramatist, and he prepared the way for Shakespeare. See also JEW OF MALTA, THE.

ASHLEY H. THORNDIKE,
Professor Emeritus of English, Columbia University.

Bibliography.—The best collected editions of his works are by Alexander Dyce (1858, 1865, and 1876), and by A. H. Bullen, 3 vols. (1885). Also consult Ward, A. W., *History of Dramatic Literature*, vol. 1 (London 1887); Ingram, J. H., *Christopher Marlowe and His Associates* (New York 1904); Bakeless, J., *Tragicall History of Christopher Marlowe*, 2 vols. (Cambridge, Mass., 1942); Kocher, P. H., *Christopher Marlowe* (Chapel Hill, N. C., 1946); Ellis, Havelock, ed., *Christopher Marlowe*, with introduction by J. A. Symonds (reissue, New York, 1948).

Marlowe's life has been the theme of two modern tragedies: Richard H. Horne's *Death of Marlowe* (1837); and W. L. Courtney's *Kit Marlowe* (1890).

MARLOWE, Julia (real name SARAH FRANCES FROST), American actress: b. Caldbeck, Cumberlandshire, Eng., Aug. 17, 1866; d. New York, N. Y., Nov. 12, 1950. She came to the United States in 1871. In 1878 she joined the Juvenile Opera Company, which presented *H.M.S. Pinafore, The Chimes of Normandy* and other light operas, in which she was known as Fanny Brough. Subsequently she took a child's part in *Rip Van Winkle*. She then retired, studied in New York for three years and then made her metropolitan debut as Parthenia in *Ingomar*. Her later roles include Viola in *Twelfth Night;* Rosalind in *As You Like It;* Highland Mary in *For Bonnie Prince Charlie* (1897); Barbara Frietchie in the play of that name by Clyde Fitch (1899), and Charlotte Oliver in *The Cavalier* (1903). Other plays in which she took the title roles are *Colinet and When Knighthood Was in Flower*. On May 28, 1894 she was married to Robert Taber, who had been her leading man in her first appearance in *Romeo and Juliet* in 1888. They starred together for a season, but owing to a disagreement were later separated, and in 1900 Mrs. Taber secured a divorce. In 1904 she joined Edward Hugh Sothern, and for several years they were joint stars in Shakespearean roles. In 1911 they married, and in 1924 she retired from the stage. Their presentations of Shakespearean plays are reckoned as some of the best ever given in the United States. She received honorary degrees from George Washington University and Columbia University.

MARMADUKE, John Sappington, American Confederate soldier: b. Saline County, Mo., March 14, 1833; d. Jefferson City, Mo., Dec. 28, 1887. He studied at Yale and Harvard and graduated from West Point in 1857, and served in the United States Army in the West. At the outbreak of the Civil War he entered the service of the Confederate States and rose to the rank of major general. In 1864 he was captured and was not released until after the close of the war, when he went abroad for a time, and on his return engaged in business and also in journalism. He was editor of the St. Louis *Journal of Agriculture* (1871–1874); and he served on the Missouri Railway Commission (1880–1885). He was defeated for the governorship of Missouri in 1880, but in 1884 was elected and served until his death.

MARMALADE, a jellied or gelatinous preparation made from quinces, peaches, apricots or oranges and portions of their rinds, with a mixture of sugar and spice. It is made like the ordinary jams, poured out warm into pots or jars and sold as a confection. The marmalade tree (*Tucuma mammosa*) is of the star-apple family, producing a large egg-shaped drupe, tasting like marmalade.

MARMARA, mär'mȧ-rȧ, **Sea of** (Turkish MARMARA DENIZI; ancient PROPONTIS), an inland sea, lying between southeastern Europe and the westernmost part of Asia, communicating with the Mediterranean by the narrow strait called the Dardanelles, and with the Black Sea by the Bosporus. Length from Gallipoli to the head of the Gulf of Izmit, 172 miles; greatest breadth, which is near the center, about 45 miles; average depth over 600 feet; maximum depth, 4,000 feet. The largest of several islands is Marmara, famous for its quarries of marble and alabaster, situated near its western end; at the eastern end, on the Asiatic coast, and not far from Constantinople, is a group called the Princes Islands. A current sets from the Black Sea into the Sea of Marmara, which in turn runs into the archipelago. The tides are hardly perceptible and the navigation is easy.

MARMETTE, Joseph Etienne Eugene, Canadian author: b. St. Thomas de Montmagny, Quebec, Oct. 25, 1844; d. Ottawa, May 7, 1895. After receiving a good general education he determined to devote himself to literature. He wrote several historical novels dealing with the main events in French-Canadian history. These include *Charles et Eva* (1866); *François de Bienville* (1870); *L'Intendant Bigot* (1872); *Le Chevalier de Mornac* (1873); *Le Tomahawk et l'épée* (1877); *A Travers la vie* (1895).

MARMIER, mȧr-myā', **Xavier,** French author: b. Pontarlier, Doubs, June 24, 1809; d. Paris, Oct. 11, 1892. He engaged in journalism and later traveled extensively in Switzerland, Holland, Germany, Russia, Algeria, America and the East. In 1835 he accompanied the scientific voyage of the *Research* to the Arctic regions and then acquired a wide knowledge of the Scandinavian and Finnish languages and customs. In 1839 he became professor of foreign literature at Rennes and in 1841 occupied a position under the minister of public instruction. In 1846 he was appointed curator at the Bibliothèque Sainte-Geneviève in Paris, in 1870 was elected a member of the Academy; and in 1884 was made administrator. Among his publications are *Histoire de l'Islande* (1838); *Langue et Littérature Islandaises* (1838); *Histoire de la littérature en Danemark et en Suède* (1839); *Lettres sur la Rus-*

sie, la Finlande et la Pologne (1843); *Lettres sur l'Amérique* (1852); *Voyage en Suisse* (1861); *Voyages et Littérature* (1888), and the novels *Les fiancés du Spitzberg* (1858); *Gazida* (1860).

MARMION, A TALE OF FLODDEN FIELD, a poem in six cantos by Sir Walter Scott, published in 1808, is the second of his metrical romances, and the first—after the preliminary experiment of the *Lay of the Last Minstrel*—in which he developed the full possibilities of the form. Because of the success of the earlier poem, he was offered £1,000 for this one before he had begun to write it—a circumstance which enabled Byron to barb his satire with the taunt:

"And think'st thou, Scott! by vain conceit perchance,
On public taste to foist thy stale romance,
Though Murray with his Miller may combine
To yield thy muse just half a crown per line?"

Like most of Scott's fiction, in prose or verse, the story of *Marmion* is based on the fundamental impulse to revivify the past, especially in connection with the historic associations of picturesque scenes. Hence he weaves a romance about persons, some historic and some imaginative, but always with an eye toward the climax, the account of the Battle of Flodden Field. It is significant, too, that the famous scene describing the quarrel between Marmion and Douglas (canto vi) was an afterthought, due to a suggestion from one of Scott's friends that he should plan Marmion's journey from England to Edinburgh so as to introduce the Douglas castle of Tantallon. Critical opinions have varied concerning the romantic plot of this poem, and Scott himself spoke severely of his having based it in part on the crime of forgery, characteristic "of a commercial rather than a proud and warlike age." But there can be no difference of view as to the splendid movement and glow of the more stirring scenes of the story—those of the kind in which Scott's genius was always at its best—especially the account of the Battle of Flodden, culminating in the death of Marmion. The work also contains some interesting personal poetry, in the epistles, addressed to different friends, which Scott prefixed to the several cantos, and (in canto v) one of his most popular narrative ballads, *Lochinvar*.

RAYMOND M. ALDEN.

MARMOL, mär'môl, **José,** Argentine author: b. Buenos Aires, Dec. 5, 1818; d. there, Aug. 12, 1871. He was a pronounced Democrat, was banished by Juan Manuel de Rosas, led the opposition against that dictator and on its successful termination became senator and librarian of Buenos Aires. A fervent orator, Marmol is better known as the author of *La Amalia* (1855), a historical novel dealing with Rosas' dictatorship, of the popular patriotic poem *El 25 de Mayo de 1843*, and of the dramas *El poeta* (1842); *El Peregrino* (1846) and *El Cruzado* (1851). *La Amalia* has long been familiar to European readers through French and German translations. An English translation of this work was published in New York in 1919.

MARMONT, mär-môn', **Auguste Frédéric Louis Viesse de,** DUC DE RAGUSE, marshal of France: b. Châtillon-sur-Seine, France, July 20, 1774; d. Venice, March 2, 1852. He entered the army as a lieutenant of infantry in his 15th year. In 1792 he changed to the artillery, and at Toulon became acquainted with Bonaparte, who chose him for his aide-de-camp. For several years after 1805 he was military and civil governor of Dalmatia, where he initiated important public works. Being called to aid in the Austrian campaign in 1809 he assisted so efficiently that Napoleon made him a marshal and governor general of the Illyrian provinces. He was again called upon in the Spanish campaign of 1811, was severely wounded at Salamanca, and was laid up for some time. In the campaign of 1813 he held the command of an army corps in Germany, and fought in the battles of Lützen, Bautzen and Dresden. In 1814 he fought a final battle under the walls of Paris, but opposition appearing fruitless surrendered to the Allies. This proceeding was one main cause of Napoleon's immediate abdication, and brought Marmont into favor with the Bourbons. After the Restoration, Louis XVIII made him a peer of France, but he was compelled to withdraw from Paris by the revolution of 1830, and his name was struck off the army list.

MARMONTEL, mär-môn-tĕl', **Jean François,** French writer: b. Bort, Limousin, France, July 11, 1723; d. Abbeville, Eure, Dec. 31, 1799. He was educated for the church, but turned to letters, and became a journalist and dramatist at Paris. In 1758–1759 he edited *Le Mercure*, and in 1763 was elected to the Academy. He wrote tragedies, including *Denys le Tyran* (1748) and *Aristomène* (1749); *Contes Moraux* (1761), and the works of fiction *Bélisaire* (1767) and *Les Incas* (1778). His *Poétique Française* (1763) and *Eléments de Littérature* (1787) have perhaps a more permanent worth. A collected edition of his writings appeared in 1786–1787. In 1771 he was appointed historiographer of France, and in 1783 was made secretary of the French Academy.

MARMOSET, the common name applied to a group of extremely small American monkeys constituting the family Callithricidae (Hapalidae) which differ from the related family Cebidae in the absence of the third molar tooth, leaving 32 instead of 36 teeth, and in having sharp curved claws on all the digits except the very short great toe which bears a flat nail. Their hands lack the dexterity possessed by other monkeys. The two families are united in a superfamily Ceboidea. Marmosets have soft silky fur, long nonprehensile tails, and are often described as squirrellike in appearance. The numerous species are grouped in two genera, *Callithrix* (*Hapale*), the true marmosets, and *Leontocebus* (*Midas*), the tamarins, which have longer canine teeth. Marmosets inhabit the forests of tropical South America, and one species, Geoffroy's tamarin, is found in Panama and Costa Rica. All are strictly arboreal, associate in small groups, and feed on fruits, insects, spiders and birds' eggs. The gestation period is about 150 days (S. Zuckerman), remarkably long for such small mammals. Unlike other monkeys they commonly bear two and sometimes three young at a birth. Marmosets are readily tamed and are greatly favored as pets, though in intelligence they are greatly inferior to the cebid monkeys. Some zoologists consider the marmosets the most primitive of all American monkeys, while others regard them as an adaptively specialized dwarf branch of the Ceboidea. See also MONKEYS; PRIMATES.

MARMOT, a large ground squirrel of the genus *Marmota* (*Arctomys*), having terrestrial habits, coarse fur, no cheek-pouches, short limbs and powerful digging claws. In size it varies from about 15 to 25 inches in length, the tail adding from 3 to 12 inches. Several species inhabit the northern parts of the world, in southerly climates keeping themselves mostly upon mountain heights, but farther north inhabiting lower levels, preferring open or thinly wooded plains. All dig and dwell in burrows, some species gathering into extensive colonies, the hillocks about the mouths of the burrows forming communities similar to the "towns" of the prairie dogs; while other species dwell in families far apart from one another. They feed upon herbage and grow very fat in the autumn preparatory to hibernation during the cold months, when their dormancy is complete. Their underground sleeping-chambers are warmly furnished with dry leaves and hay. The European marmot (*M. marmota*) is found plentifully in the Alpine range, equals a rabbit in size and is light brown in color. It lives immediately below the snow line, and subsists on vegetables, insects and roots. It comes forth from its burrow during the month of April, and is said to be readily tamed. The bobac, another European species (*M. bobak*), inhabits Poland, Russia and all northern Asia. A third species is found in the Himalayan ranges; and a fourth (*M. caudatus*), the largest and handsomest of the family, dwells in the valleys of their southerly slopes. These little animals are of great value to the wandering natives of northern and central Asia, who utilize both their skins and flesh. America has two marmots, one of which is the siffleur or whistler of the tops of the northern Rocky Mountains, and the other the familiar Eastern woodchuck. The former takes its name from the loud eerie whistle with which it wakes the echoes of the crags about the lone pastures above timber line, where it makes its home; it was of great service to the mountain Indians. Other species or varieties occur in the southern mountains of the Western states. The woodchuck or ground hog (*M. monax*), is a heavy, broad-headed, grizzled animal of the woods and fields, yellowish to whitish gray in color, blackish on the back and crown and chestnut on the belly; with the feet and tail brownish black. It abounds throughout the whole country east of the dry plains, and flourishes in spite of civilization, as the farmers' meadows and gardens supply it with an increased supply of good food, and mankind thins out its worst enemies, such as wildcats, foxes, weasels, the larger serpents and birds of prey; none of these save the first is much to be feared by the full-grown woodchucks, but may kill many of the young. As a result the animals have become unpleasantly numerous in some districts of the Eastern states, where their depredations upon gardens and certain plantations, as of lettuce, carrots, and celery, are often serious.

MARNE, märn, river, France, the chief affluent of the Seine, rising in the plateau of Langres, flowing northwest past Châlons to Épernay, thence westward, joining the Seine at Charenton-le-Pont, four miles above Paris. Its length is 325 miles, 220 of which are navigable. It is connected by canals with the Rhine, the Aisne and the Seine. The Marne was the crucial fighting line of the western front during World War I. The river was reached by the American forces in August 1944, during World War II.

MARNIAN EPOCH, name given to the period known in France as the Gallic, in England the late Celtic and in Switzerland as La Tène. It extends from about 500 B.C. to the conquest of Gaul by Julius Caesar. It is named Marnian from the French department of the Marne where the richest deposits of the period have been found.

MARNIX mär'nĭks, **Philipp von,** Baron Saint-Aldegonde, Flemish statesman and writer: b. Brussels, Belgium, 1538; d. Leyden, Dec. 15, 1598. He studied at the universities of Paris, Louvain, Dôle, and Pavia. While in Italy he became a strict Calvinist, and in 1566 he wrote a defense of the iconoclasts. He later was forced to flee to Bremen and East Friesland. In 1571 he took up residence in the home of William of Orange, and thereafter performed many missions for William, until he was captured by the Spanish (1573), and held prisoner for a year. In 1578 he was ambassador to the Diet of Worms. In 1585 he retired from political life after Antwerp, of which he had been burgomaster, capitulated to Alessandro Farnese. His most renowned work was *Tableau des différends de la religion* (1598). He also wrote the Flemish national song *Wilhelmuslied* and translated the Psalms of David.

MAROC. See Morocco.

MARONITES, măr'ō-nīts, a sect of Eastern Christians, whose origin was a consequence of the Monothelite controversy. In the 7th century the opinion that Christ, though He united in Himself the divine and human natures, had but one will arose among the Eastern nations. But when their last patron, the Emperor Philippicus, was deposed and exiled in 713, the Monothelites were condemned and banished by his successor, Anastasius II. The remnant of this party survived in the Maronites (so named from their founder, Maron)—a society of monks in Syria, about Mt. Lebanon, which is mentioned as early as the 6th century. Another monk, John Maro, or Maron also preached Monothelitism there in the 7th century. Regarded as rebels by the Melchites (q.v.), or Christians who adhered to the opinions of the emperor, they became, in that district of Lebanon which is now called Kisrawan, a warlike mountain people, who defended their political as well as their religious independence boldly against the Mohammedans, and who even under the Turkish government resisted the payment of a tribute, like the Druses. The political constitution of the Maronites is that of a military commonwealth. Governed by their ancient customary rights, defended from external attacks, they support themselves among the mountains by husbandry and the produce of their vineyards and mulberry trees. The revenues of all their orders of ecclesiastics are very small, but a common spirit unites them, and in simplicity of manners, temperance and hospitality they resemble the ancient Arabians. Revenge for murder is permitted among them, and as a sign of nobility they wear the green turban. Their church constitution resembles very much that of the old Greek Church. Since the 12th century they have several times accepted papal supremacy and the Roman Catholic

Church, without giving up their own peculiarities. At last Clement XII induced them to accept the decrees of the Council of Trent at a synod held in 1736 at their convent of Marhanna. After this synod their priests still retained the right to marry, after the manner of the Greek Church; and they continued to administer the sacrament under both forms. The use of the Arabic language was preserved in the church service. Mass was read only in the ancient Syriac. Their head is called the patriarch of Antioch, although his residence is in the monastery of Kanobin, upon Mount Lebanon; and he gives an account every 10 years to the pope of the condition of the Maronite Church. Under him are the bishops and other clergymen, who form seven degrees of rank. In Kesrouan are over 200 Maronite convents and nunneries, containing in all from 20,000 to 25,000 members who profess the rule of Saint Anthony and devote themselves to agriculture and gardening. Since 1584 there has been a Maronite college established at Rome for the education and training of their clergy. The Maronites supposed to number about 300,000, and these are distributed into 150 parishes throughout Syria, Palestine, Egypt and Cyprus. In consequence of recurrent sanguinary conflicts between Maronites and Druses, in 1861 under pressure of the Powers Lebanon was organized into an autonomous sanjak ruled by a Christian governor appointed by and directly responsible to the Porte. During the First World War thousands of Maronites were killed by the Turks. Governed by their emirs and enjoying a certain amount of independence they form a little nation within the framework of the Republic of Lebanon (q.v.), which, as part of France's Syrian mandate, remained under French jurisdiction until France withdrew her occupation army, Sept. 1, 1946. Consult Bliss, F. J., *Religions of Modern Syria and Palestine* (1912). See DRUSES.

MAROONS, the name given to runaway Negro slaves in Jamaica and in some parts of South America. The name seems to be equivalent to mountaineers, being derived from Spanish, *cimarron,* a fugitive Negro or maroon, from *cima* (same as French *cime*), a summit or hilltop. In many cases runaway Negroes, taking to the forests and mountains, rendered themselves formidable to the colonists and sustained a long and brave resistance against the whites. When Jamaica was conquered by the English in 1655 about 1,500 slaves retreated to the mountains. They continued to harass the island till 1795, when they were finally reduced by the aid of bloodhounds. Some of them were removed to Nova Scotia, and afterward to Sierra Leone.

MAROQUIN, măr-ō-kēn'. See MOROCCO (leather).

MAROS, mo'rosh, river of Rumania. It rises in eastern Transylvania and flows westward for about 550 miles, joining the Theiss at Szegedin and flowing into the Danube. Its watershed is about 30,000 square miles. It is navigable to Karlsburg, about 300 miles.

MAROT, mà-rō', **Clément,** French poet: b. Cahors, Quercy, winter of 1495–97; d. Turin, 1544. His father was *escripvain* or historiographer to Anne of Brittany. He went to Paris in 1506, was educated at the university there and studied for the bar. Through his father's interest, he entered the service of Francis I; and in 1519 was attached to the suite of Margaret d' Angoulême, the king's sister. In the battle of Pavia he was wounded and taken prisoner, but on his return to Paris became a member of the royal household. Imprisoned once as a Protestant heretic, and coming again into serious risk, he fled to Navarre and to Italy; returning, he had to flee finally in 1543. Being as much a freethinker as a Calvinist, he found no shelter in Geneva, whither first he betook himself, and went to Turin, where he died. His early poems are stiff; his later ones are almost unsurpassed for ease and grace, in which qualities his only rival is La Fontaine. He wrote many rondeaux, epigrams, epistles and ballads; also the poem *L'Enfer.* His famous translation of the Psalms in poetry—superior to the inadequate French prose translation of the Scriptures at that time —is said to have promoted the cause of the Reformers and was sung at the court and was widely popular in the country. Consult Morley, Henry, *Clement Marot, and other Studies* (London 1871); Tilley, A. A. *Literature of the French Renaissance,* vol. I (New York 1904).

MAROZIA, mà-rō'zhĭ-à, a 10th century Roman lady of infamous reputation, known for her influence in Rome and at the papal court. She was a daughter of the equally infamous Theodora, wife of the consul Theophylact, and was first married to Alberic; and after his death to Guido of Tuscany; and after the latter's death, to Hugo, King of Italy. Through the power of her family, and by her marital alliances, she exercised absolute control over Rome for several years. She deposed Pope John X in 928 and may have caused his death. Later she bestowed the papacy on her son, John XI, who was said to have been the offspring of her guilty love with Pope Sergius III. She styled herself "Senatrix" of all the Romans and "Patricia." In 932, shortly after her third marriage, she and her husband were imprisoned by her son, Alberic II. Her husband escaped, but nothing is known of her fate. See Gregorovius' *History of the City of Rome in the Middle Ages.*

MARQUAND, mär-kwänd', **Allan,** American archaeologist: b. New York, Dec. 10, 1853; d. there Sept. 24, 1924. In 1874 he was graduated at Princeton University and studied subsequently at the universities of Berlin and Johns Hopkins. In 1881–83 he was engaged as tutor and lecturer and from 1883 to 1905 was professor of archaeology and the history of art at Princeton. After 1905 he was professor of art and archaeology at the same institution. From 1890–1921 Dr. Marquand also was director of the Princeton Museum of Historic Art, and 1896-97 was professor of archaeology at the American School of Classical Studies, Rome. After 1885 he was associate editor of the *American Journal of Archaeology.* Dr. Marquand published *Greek Architecture* (1909); *Della Robbias in America* (1912); *Luca Della Robbia* (1914); *Andrea della Robbia,* 2 vols. (1922); joint author of *History of Sculpture* (1896–99), and archaeological articles in various journals.

MARQUAND, Henry Gurdon, American banker and philanthropist: b. New York, April 11, 1819; d. Feb. 26, 1902. He was educated in Pittsfield, Mass., and for 20 years was in the real estate business, afterward becoming a banker and acquiring an interest in various

railways and other commercial enterprises. He was a generous patron of the Metropolitan Museum of Art, to which he gave valuable paintings, and among his other gifts are a pavilion to Bellevue Hospital, New York City, and a gymnasium and a chapel to Princeton University.

MARQUAND, John Phillips, American novelist: b. Wilmington, Del., Nov. 10, 1893. He is a descendant of distinguished New England families that include Governors Joseph and Thomas Dudley (qq.v.) of Massachusetts and Margaret Fuller, the transcendentalist. He grew up in New York City and Rye, N. Y., and attended high school in Newburyport, Mass. After being graduated from Harvard University in 1915, he wrote for the Boston *Evening Transcript.* During World War I, he was an artillery officer in France and then returned to New York as a writer on the *Tribune* and later for an advertising agency.

In 1920 Marquand began writing fiction professionally, publishing his novels in *The Ladies Home Journal* and *The Saturday Evening Post.* The novel which first brought him distinction in American letters was *The Late George Apley* (1937) which won the Pulitzer Prize for fiction in 1938. By that novel, as well as *Wickford Point* (1939) and *H. M. Pulham, Esquire* (1941), he became well known as an interpreter of Boston and New England characters. He depicts them as sheltered, unhappy people, unable to break the strict moral code of family tradition.

His later novels shifted from New England settings but in essence continued to remain as modern novels of manners. World War II played an important part in *So Little Time* (1943), *Repent in Haste* (1945), and *B. F.'s Daughter* (1946). Marquand's subsequent novels included *Point of No Return* (1949), a satire of postwar New York bankers which re-examined the conflict between spiritual and materialistic values, and *Melville Goodwin, U.S.A.* (1951), a portrait of life among the army high brass which was accepted by some critics as a defense of the professional soldier. See also LATE GEORGE APLEY, THE; NOVEL—*Modern* (American).

MARQUESAS ISLANDS, mär-kā'sàs, or **MARQUEZAS,** French Oceania, a group in the South Pacific about 740 miles northeast of Tahiti and 2,000 miles south-southeast of Honolulu. The 13 islands have an aggregate area of 480 square miles. Most important of the islands are Nuku Hiva, Ua Pu, and Ua Huka, in the center; Hiva Oa, Tahuata, and Fatu Hiva, in the southeast; and Eïao and Hatutu, in the northwest. Atuana (Atuona), a village on the south coast of Hiva Oa, is the seat of administration. The original administrative headquarters was at Taiohae, a village on the south coast of Nuku Hiva. All the islands, which have a volcanic origin, are wild and rugged in appearance; there are steep cliffs on the east coasts, the rocks being fretted into fantastic shapes. Mountains are found in the interior of the islands; the highest point, on Hiva Oa, attains an elevation of 4,134 feet. The fertile valleys are copiously watered by mountain streams, where a luxuriant vegetation, hundreds of varieties of flowers, bamboo, palms, and some timber trees grow. The climate is humid but healthy, with cool nights and frequent breezes. The Marquesans are of the purest Polynesian type, light skinned and with regular features and fine stature. Formerly ritualistic cannibals, they still give evidence of a pugnacious and untamed temperament. They cultivate such food crops as plantains, bread fruit, yams, and corn, grow a small amount of cotton, and trade in cottonseed and copra. The Marquesas were discovered about 1595 by the Spanish mariner Alvaro de Mendaña de Neyra, who named them for the wife of the marquis of Mendoza, his patron. They were rediscovered in 1774 by Captain (James) Cook, and in 1791 Étienne Marchand planted the French flag on the islands. In 1791, also, Capt. Joseph Ingraham (1762–1800), of the United States, sighted Nuku Hiva and seven islets around it, naming them the Washington Islands. On Nov. 19, 1813, David Porter (1780–1843) claimed Nuku Hiva for the United States, naming it Madison's Island, but the annexation was never ratified. In 1842 France formally took possession, but the colony then established on Nuku Hiva was abandoned in 1859. It was not until after 1870 that French administration of the Marquesas was reinstituted. Pop. (1946) 2,988. See also FRENCH OCEANIA.

Consult Robson, R. W., *Pacific Islands Handbook* (New York 1946); Robson, N., *French Oceania* (Sydney, Australia 1951).

MARQUET, mär-kĕ', **(Pierre-) Albert,** French painter: b. Bordeaux, March 27, 1875; d. Paris, June 14, 1947. He studied at the École des Arts Decoratifs and the École des Beaux Arts, becoming an admirer of the works of Claude Monet, Vincent van Gogh, and Paul Cézanne. In his landscapes, for which he was best known, the subject was reduced to its essential detail and the bold, free use of colored masses was substituted for the tiny vibrating brush strokes of the impressionists. His views of Paris, particularly of Notre Dame and of aspects of the Seine painted from his studio window on the Quai des Grands-Augustins, established his reputation. Seaports had a particular attraction for him. He painted at Le Havre, Naples, Hamburg, Honfleur, Rouen, Rotterdam, Marseille, North Africa, and elsewhere. His work is represented in Paris at the Louvre and Luxembourg museums, and in several other European cities.

MARQUETRY, mär'kĕ-trĭ (French, *marqueterie*), mosaic or ornamental wood, metal or ivory inlaid in furniture, and smaller articles. In Venice, in the 15th century, caskets were inlaid with geometrical shapes of wood and ivory, and the Italian "intarsia" work of the 16th century was at first geometrical, and later developed into pictorial design. By the end of the 17th century marquetry in a number of intricate designs was being applied to Continental furniture. The English furniture makers of the 18th century employed it freely. See also BUHLWORK; INLAYING; PARQUETRY.

MARQUETTE, mär-kĕt', **Jacques** (known as PÈRE MARQUETTE), Jesuit missionary and explorer in America: b. Laon, France, June 1, 1637; d. near present Ludington, Mich., May 18, 1675. Sent to New France in 1666, he was appointed missionary to the Ottawas and established a mission at Sault Sainte Marie, Lake Superior, in 1668, another at La Pointe de Saint Esprit, Chequamegon Bay (1669), then the St. Ignace on Mackinac (1671). It is plain—putting aside

all imputed motives,— that Jesuits like Jogues, Albourg, Druillettes and a hundred others did not lead lives of unspeakable deprivations and amazing self-sacrifice merely for temporal gain for their Society or their country. When it is known that they were French, it is at once known that they were patriots. And if the Jesuits opposed the mercantile designs of the supporter of La Salle, it must be admitted, in the light of after events, that they were safeguarding the interests of their charges. The fate of Jogues and of René Goupil did not deter men like Marquette. It only made them more anxious to teach Christianity or to die. Marquette, like all the missionary priests of his Society, held that it was his duty to contribute to the knowledge of the world. Whether it was the analysis of a dialect or the bending of a river, the Jesuit made each his duty, always remembering the motto of his Society, "To the greater glory of God." Marquette had kept in mind all the talk about the great river and the natives that dwelt upon its banks. He was sent, he believed, as one who must teach all nations, and he did not disdain any knowledge that might help him to this, valuing the knowledge itself, for every Jesuit was a student both of nature and of books. Louis Joliet had started to become a Jesuit, but had, instead, become a fur trader. When he was commissioned by the governor of New France, to look for the great stream that, it was rumored, opened into the Pacific, Father Marquette, who earnestly desired it, was sent by his superiors to accompany him. On 8 Dec. 1672 Joliet reached Saint Ignace under his own authorization from De Frontenac and one from Father Marquette's provincial, to claim for God and the king all the land and water they could find.

When the ice broke, on 17 May 1673, Marquette and Joliet set forth. Father Pierson took Father Marquette's place at the mission. Father Marquette was something of a surveyor, and his maps are yet in evidence and very valuable. Two birch canoes that could only hug the shore and not dare the open lakes, and seven men,— five *voyageurs* — made up the expedition. Their stores were barely sufficient, their scientific instruments were, as one can easily imagine, inadequate. They were hopeful, hardy and they knew every mood of the treacherous lakes and the meanings of all the changes in the weather. Marquette had acquired the quick eye and ear of the Indian, and his mind was supple and well-trained; Joliet was not far behind him in wood and water craft. Still, they followed dim rumors. The most interesting of Marquette's reports is that of the second halt at the Indian village of Mascouten, on Lake Winnebago. They had reached the "jumping off" place. Their first halt was at De Pere, the Mission Saint Francis Xavier, to which Father Marquette had been recently assigned. They reached Lake Winnebago by way of the Fox River. From Green Bay,— the Mission Saint Francis,— they went to Lake Winnebago, and, from thence, accompanied by the Indian guides, they ascended the upper Fox River and entered the Wisconsin, on 10 June 1673. After seven days of hard paddling, they entered the Mississippi on 17 June. The report of this expedition on which we must rely for information is Marquette's,— Joliet's having been lost in the upsetting of his canoe at the La Chine Rapids, near Montreal. It is included in the 'Jesuit Relations,' and quoted by John Gilmary Shea, Sparks, Parkman, Thwaites, Hedges, and all who have written of the early days of the Northwest. Dr. Shea, in his 'Discovery and Exploration of the Mississippi Valley,' estimates the distance traveled by Marquette and Joliet from Saint Ignace to Green Bay (Mission Saint Francis Xavier), at 218 miles. General Wood, inspector-general United States army, makes the whole distance traveled 2,549 miles, but he omits the distance from Saint Ignace to Green Bay. Marquette and Joliet explored the Mississippi for 300 miles in solitude. Marquette describes the river at its junction with the Missouri as turbulent in the extreme. Marquette was pleased by the treatment received at the first village of Illinois Indians. They met Indians who showed some traces of civilization, and at the mouth of the Arkansas, they met with great kindness from the Indians. From the Illinois — believing the route to be shorter — they went, it is asserted, to a point near Chicago. By portage, at Sturgeon Bay, they saved time and strength, and from the Green Bay into the Fox River, they reached the Mission Saint Francis — having spent, from the beginning of their ascent of the newly-discovered river, on 17 July, about two months — four months, in all, of almost incessant hardship since they began their voyage on 17 May 1673. Further journeying was out of the question. Marquette and Joliet had not much strength left. A journey of nearly 3,000 miles, in birch canoes, had told on them, hardy as they were. Marquette spent 13 months at De Pere, endeavoring to regain his health. He knew well the stupendous importance of what he had done for France and for the world; but his business was with souls. While Joliet went to Montreal to report, Marquette started to found a new mission in Illinois. He left the Mission Saint Francis on 25 Oct. 1674, with 10 canoes; he arrived at the Chicago River, 4 December. The description of the carrying of the canoes through the forests gives a glimpse of the difficulties the missionary expected to encounter. The inundations of 30 March 1675 destroyed their hovel. At Kaskasian Marquette's heart was filled with gratitude by the kindness he received. His desire for exploration led him, while using his strength in ministering to the Indians, to explore Lake Michigan farther. He grew weaker, and turned to the north. Through the river — now Pere Marquette — he made his homeward way. On Saturday, 18 May 1675, he died. The Ottawa — under that name were included the tribes under the Jesuits in the Lake regions — had among them several Hiskakons, to whom Marquette had been much devoted. These, going northward in the spring, raised his body, reverently prepared it according to the mode of their tribe, took it to the Mission Saint Ignace, where Fathers Nource and Pierson awaited it. On Tuesday, 9 June 1676, Marquette was buried in the centre of the chapel of Saint Ignace, a building which was destroyed by fire in 1706. In September 1877, Father Edward Jacker, pastor of Saint Ignace, discovered the grave and remains of the great and good explorer, and they rest under a monument erected by the citizens of Saint Ignace in 1882. MAURICE F. EGAN,
Formerly Professor of English Language and Literature, Catholic University of America.

MARQUETTE, mär-kĕt', Mich., city, resort and Marquette County seat; altitude 602 feet; on the south shore of Lake Superior in the Upper Peninsula; between the Carp River on the east and Dead River on the north; 15 miles east of Ishpeming; 180 miles north of Green Bay, Wis.; on the Duluth, South Shore and Atlantic, and Lake Superior and Ishpeming railroads; with freight steamship service to lake ports. It has a fine harbor with a breakwater 4,500 feet long, and excellent facilities for loading steamers with the iron ore shipped from here in large quantities. Two great docks have storage capacity of 50,000 tons each, and are equipped with ore mixing compartments. Near the city are trap rock quarries. The chief industrial establishments are railroad shops, foundries, saw and planing mills, woodenware factories, plants for producing chemical byproducts of wood, and manufacture of machine parts and mining equipment. The Northern Michigan College of Education, established in 1899, is here. The State House of Correction and Branch Prison (founded 1885) has an unusual arts and crafts department. The Peter White Public Library, built in 1904 and named for the city's most noted pioneer, also houses the museum and library of the County Historical Society. Presque Isle Park, which was presented to the city by the Federal Government, includes Granite Point where the American flag was first raised in 1820 by Governor Lewis Cass. The French explorers found copper in this region in the 17th century. Silver and lead were mined on Presque Isle Peninsula in 1845. Iron ore was discovered in the Marquette area in 1830, 1841, and 1844, and mining began in 1846. Ore was first transported by sleigh, later by mule cars over a plank road and finally, in 1857, by rail. In 1950 production reached a peak of over eight million tons. The first permanent settlement at this point was made about 1849 and called Worcester, after the Massachusetts city. In 1850 the city was renamed after Père Marquette (q.v.), the 17th century French Jesuit missionary to the Indians, whose explorations helped to open the Northwest Territory to settlement. It was incorporated as a village in 1859. Destroyed by fire in 1868, it was rebuilt and incorporated as a city in 1871. Diversified industries and summer tourist trade have helped to maintain the industrial stability of the city. Pop. (1940) 15,928; (1950) 17,202.

MARQUETTE RANGE. See IRON—*Iron Ore Districts of the United States.*

MARQUETTE UNIVERSITY, Milwaukee, Wis., comprises the following schools and colleges: College of Liberal Arts; College of Business Administration; College of Engineering; College of Journalism; College of Nursing; School of Speech; Dental School; Law School; School of Medicine; Graduate School, and Summer School.

This Roman Catholic university, which is conducted by members of the Jesuit Order, offers 19 kinds of baccalaureate degrees, four master's degrees, the M.D., the D.D.S., the J.D., and the Ph.D.; also diplomas in Dental Hygiene and in Nursing, and a certificate in Public Health Nursing. The library comprises, besides departmental collections, the libraries of the several schools and colleges. Students have access to the Milwaukee Public Library and to the city's Public Museum, one of the largest and most complete in the United States, containing hundreds of thousands of zoological, botanical, mineralogical, and other specimens, both institutions being located within two city blocks of the University. The history of Marquette University begins with the arrival of Jesuit fathers in 1855, who two years later opened Saint Aloysius Academy. In 1864 a new building known as Saint Gall's Academy was erected. In the same year a charter for Marquette College was obtained. In 1906 it celebrated its silver jubilee with the erection of a new building called Johnston Hall. An amended charter creating Marquette University was obtained in 1907. The Jesuit administrative officers and teachers serve the university without salary or other recompense beyond personal support. Administration Hall was erected in 1938 through the gift of an anonymous donor. It houses the general administrative offices. The Marquette University High School at Milwaukee is also conducted by members of the Jesuit Order.

MARQUEZ, José Arnaldo, hō'sā' ar-nal'do mär-kās', Peruvian poet: b. Peru, about 1825; d. Lima, Jan. 15, 1881. For participation in civil wars he was several times banished in the earlier part of his career and he lived variously in Chile, Cuba and the United States. Among modern Peruvian poets Márquez takes high rank. He published *Lost Notes* (1862); *Flor de Abel,* etc., and in prose *El Perú y la España moderna,* and *Recuerdos de un viage à los Estados Unidos de América.* He lost his life in the defense of Lima against the Chileans.

MARQUEZ, Esteban, Spanish painter: b. Estremadura, c. 1650; d. Seville, 1720. Portraitist and founder of the Seville academy, he was a good colorist, Murillo style.

MARQUEZ, Leonardo, Mexican soldier: b. Mexico, about 1820; d. Havana, July 4, 1913. After serving against the United States in the Mexican War (1846–1848), Márquez supported the second dictatorship (1853–1855) of Antonio López de Santa Anna, under which he held important army posts. He fought against Benito Juárez in the War of the Reform (1857–1860), during which he received the name "tiger of Tucubaya" from his execution there of a number of prisoners on April 11, 1859, although he alleged the express order of Gen. Miguel Miramón as an explanation. Márquez supported the French intervention in 1862, and Maximilian's empire (1864–1867). He was made a division commander in October 1866. Upon the withdrawal of French troops in the following March, Márquez attempted to form a Mexican army to support the empire, being sent by Maximilian to Mexico City to raise troops for the relief of the emperor beseiged at Querétaro. That city, however, was captured by Juárez' troops on May 14, 1867, and Mexico City on June 21, two days after Maximilian's execution. Márquez escaped to Havana. He was specifically exempted from the amnesty of 1870.

MARQUEZAS ISLANDS. See MARQUESAS ISLANDS.

MARQUIS, mär'kwis, or **MARQUESS** (Italian, *marchese;* French, *marquis;* German, *markgraf*), a title of honor next in dignity to that of duke. Marquises were not known in England till King Richard II, in the year 1385, created his great favorite, Robert Vere, the Earl of Oxford, Marquis of Dublin. In 1397 the same king raised John de Beaufort, Earl of Somerset, to the rank of marquis, a dignity which he afterward refused to bear from its being an innovation. The title fell into disuse until the reign of Edward VI, who created the marquisate of Winchester in 1551. The title given a marquis in the style of the heralds is *most noble and potent prince.*

MARQUIS, Thomas Guthrie, Canadian author: b. Chatham, New Brunswick, 1864. He received his education at Queen's University, Kingston; was made English master at the Stratford High School and subsequently at the Kingston Collegiate Institute. Later he became principal of the Collegiate Institute at Brockville. After 1901 he devoted his entire time to literature. In 1905 he was chief editorial writer on the Ottawa *Free Press.* Subsequently he edited 'Canada and its Provinces' (22 vols., 1914–15). He also published 'Stories of New France' (1890); 'Stories from Canadian History' (1893); 'Marguerite de Roberval: A Romance of the Days of Jacques Cartier' (1899); 'Canada's Sons on Kopje and Veldt' (1900); 'Life of Lord Roberts' (1901); 'President of the United States' (1903); 'Brock: The Hero of Upper Canada' (1912); 'The War-Chief of the Ottawas' (1914); 'The Jesuits Missions' (1915). He edited the Canadian biographical collection entitled, 'The Builders of Canada' (1903). D. 1 April 1936.

MARRAKESH. See MOROCCO.

MARRELLA, a genus of fossil Crustacea found in the Cambrian shales of British Columbia.

MARRIAGE, History of (Latin, *marito,* from *maritus,* husband, from *mas,* a male). In the natural history sense marriage may be defined as a more or less durable union between male and female lasting till after the birth and rearing of offspring. In the ethical and legal sense marriage is a union between man and woman living in complete community of life for the establishment of a family. See article on the FAMILY, HISTORY OF.

The Origin and Social Function of Marriage.— In the natural history sense of the word marriage may be said to exist among many of the animals below man. Pair marriage is common among the birds and some of the higher mammals. It especially characterizes the anthropoid apes, the pair marriage of the chimpanzee being monogamous and durable, probably not unlike that of primitive man. The origin of marriage is therefore to be sought in the family, rather than the origin of the family in marriage. See article on family above referred to.

The function of marriage in human society is twofold: (1) to regulate the relations between the sexes and (2) to determine the relation of the child to the community. This latter function is often overlooked, but is quite as important in any scientific consideration of marriage as the former.

Practically all forms of marriage may be found among human beings if we consider all peoples and all historical ages, although the primitive or original form of marriage seems to have been that of a simple, pairing monogamy, similar to the pair marriage which is common among the higher animals. The reasons for rejecting the hypothesis of a primitive state of promiscuity have already been given in the article on the family just cited. Whether such a form as communal or group marriage (limited promiscuity) has ever existed among any people has been much debated by anthropologists and sociologists. The nearest approach to this form of marriage is found in certain aboriginal Australian tribes, where a man who takes a wife from a certain group has sexual access to all the other women of that group, though he lives with only one of them. A similar form is to be seen in the Punaluan family of the Polynesians, the marriage of a group of brothers with a group of sisters, though this form was rare even among the Polynesians. Most anthropologists and sociologists believe that such forms of group marriage were not primitive, but were relatively late historical developments. Setting these aside as exceptional forms, the main types of marriage in the human species may be grouped under the heads of polygyny, polyandry and monogamy.

Polygyny (Greek, "many wives").—A common form of marriage in barbarism and lower civilization is the union of one man with several women, scientifically known as polygyny, but popularly called polygamy. It is possible that this form of marriage existed to some extent in primitive times, as the gorilla among anthropoid apes is said to practise it. In general, however, it presupposes a considerable accumulation of wealth and is therefore among strictly savage peoples very rarely practised. As a human institution it received its chief development in the period of barbarism, and seems to have been an accompaniment of the development of dominantly militant life and of slavery in that period of human culture. Among people who practise polygyny, therefore, the practice is largely confined to the wealthy and ruling classes, as only these can afford the luxury of having more than one wife. In polygynous countries of the present rarely over 5 per cent of the families are of polygynous type. Owing to the fact that the number of males and females in any given population under normal conditions is relatively equal even in polygynous lands, the mass of the families are necessarily monogamic.

The causes of polygyny are complex. Beside the animal instincts of the male we must place especially the military honor of wife capture and the economic value of women (or wives) as laborers. In barbarism the outward and visible sign of a man's wealth and power is frequently the number of his wives. A contributory cause among some peoples is the high valuation set upon children, especially under the patriarchal system (q.v.). This seems to have been the main cause in the case of the Hebrew patriarchs.

The practice of polygyny has been widespread among practically all peoples from the

stage of barbarism up, though limited to the prosperous and well-to-do. Where it failed of legal sanction it frequently existed in the more or less illegal form of concubinage. It is not surprising, on this account, that in many cases it has received the explicit sanction of religion as in the cases of Mohammedanism and Mormonism. But among all peoples it has tended to die out with the coming of higher civilization, for the reason that it obviously involves the subjection and degradation of woman, the lack of paternal care of the children and the placing of a premium upon the more brutal instincts of human nature, especially in the male.

Polyandry (Greek, "many husbands").—The union of one woman with several men is a rare form of marriage found at present practically only in Tibet and among some of the mountain tribes of India, though within historic times it existed in Arabia. Apparently polyandry has never been a wide-spread form of marriage in the human species, as the instinctive jealousy of the male works against it; and there is no reason for supposing, as McLennan supposed, that primitively it was universal. On the contrary, it seems to exist only under such economic and social conditions as might lead to the suppression of male jealousy. Thus the difficulty of one man supporting a family has in the barren regions of Tibet led to the toleration of polyandry. In the same region there seems to be a scarcity of women, which also favors the practice of polyandry.

The most common form of polyandry is the fraternal or Tibetan form, in which a group of brothers have a common wife, the oldest brother being the head of the household and the putative father of all the children. Among the Nairs of India, however, a non-fraternal form of polyandry exists.

Monogamy (Greek, "single marriage").—Polygyny and polyandry, as we have seen, have always been exceptional forms of marriage. The prevalent form of marriage among all peoples and in all ages has been some form of monogamy, the union of one man and one woman. This has been so largely by biological necessity, as under normal conditions the number of males and females in any given population is relatively equal. The instincts of man have also to some extent favored monogamy, especially the instinct of sex jealousy. Economic conditions also have rarely made it possible for a man to support more than one wife and her children. Besides such biological and economic reasons for the existence of monogamy, however, it has manifest social superiorities to any other form of marriage. It is much more favorable to superior care and upbringing of children, as under monogamy both husband and wife commonly unite in the care of the child. It develops affections and emotions of a more altruistic type, and it makes the bonds of the family life more definite and strong. For these reasons monogamy favors the development of higher types of morality and of civilization generally. Its association with higher types of civilization is, therefore, not an accident. At its best, the monogamic family presents such superior unity and harmony that it is best fitted of all the forms of marriage to work in harmony with higher civilization.

The Marriage Ceremony.—Among all peoples, savage as well as civilized, legal marriage is usually accompanied by some form of ceremony which expresses the sanction of the group upon the union. This ceremony is usually of a magical or religious character though in a few peoples it is apparently purely social. Betrothal is also, among the more advanced peoples, frequently an occasion for some sort of religious or social ceremony.

The Freedom of Choice in Marriage.—Westermarck presents considerable evidence to show that among primitive peoples marriage was originally based on the mutual attraction and consent of the parties. Almost always the male is the wooer. The female accepts or rejects her lover, and thus plays the decisive rôle in sex selection. The same phenomena of courtship also appear very generally among the animals. There is no reason for supposing that different conditions existed among primitive men. The common practices of wife capture and wife purchase must be regarded as exceptional conditions developed in later stages of civilization. Marriage thus began in free choice, but among many peoples passed through stages of wife capture, and of wife purchase under the dominance of family or tribal interests, becoming only gradually in modern times again a matter of free individual choice.

Marriage by Capture and by Purchase.—Among predatory and warlike tribes marriage by capture is often common; indeed, on account of the social and military honor attached to wife capture, it sometimes comes to be the favorite form of marriage. We know of no people, however, among whom wives are regularly captured outside the tribe. Manifestly such a social state would be practically impossible, even though wife capture was socially favored.

Much more common than wife capture, but at a much later stage of cultural development was wife purchase. This stage comes in particularly in early barbarism with the development of slavery and the idea of property in persons; and among most peoples it has survived until higher civilization has been developed. It was particularly instrumental in developing polygyny and the patriarchal form of the family. Many survivals of wife purchase exist among even relatively highly civilized peoples.

Child Marriage.—Another result of wife capture and wife purchase among some peoples was the practice which we know as "child marriage," that is, the uniting in formal marriage of children under 15 years of age, usually the marriage of a girl under 15 with a much older man. As a custom, child marriage is not unknown among warlike savage and barbarous tribes. It developed, especially in India, however, under the influence of the caste system and the custom of wife purchase. More than one-half of the total female population of British India are married before 15 years of age, sometimes while they are mere infants. In the western provinces of India the girl remains at home with her parents until sexual maturity is reached; but in Bengal, girls commence their married life at the age of nine years. The British government has made ineffectual attempts to check child marriage, but the practice continues, as it is supported by the higher as well as by the lower Hindu castes.

Exogamy and Endogamy.—Among practically all peoples, custom forbids the marriage of very near kin. A limited number of tribes among savage and barbarous peoples do not forbid the marriage of brothers and sisters, but all view with social disapproval sexual relations between parents and children. Indeed, the larger number of uncivilized peoples not only condemn sexual relations between blood relatives, but forbid marriages between members of the same clan, or totem group. As clans may be metronymic or patronymic, this restriction prevents marriage between maternal or paternal relatives as the case may be, even to the most remote degrees of kinship, but makes it possible for a man to marry a near relative in a clan to which he does not belong, on the ground that no kinship tie exists between them. This custom forbidding marriage within the clan is known as "exogamy." It is nearly always correlated with "endogamy," as respects the tribe.* Thus in the clan or totemic stage of social organization, in which most of the North American Indians were at the time of their discovery, a man must take a wife outside of his clan or totem-kin group, but usually must marry within his tribe or related tribes.

The causes of such customs of exogamy and endogamy have been much debated. McLennan held that exogamy was the outgrowth of the custom of female infanticide, but there is little or no evidence in support of such a theory. Westermarck's explanation is that exogamy arises from the extension to the whole clan of the natural instinct of aversion to incest. It may be pointed out, however, that exogamy and endogamy are not customs peculiar to uncivilized peoples. Similar rules are found regarding forbidden degrees of relationship among civilized peoples. While there is possibly a natural aversion to incest, there is even more pronouncedly instinctive attraction between persons of the opposite sex who are relatively strange and unfamiliar. This leads naturally among all peoples to marrying outside of the close social group; and among the uncivilized all members of a clan are regarded practically the same as very near relatives. The main difference in the practice of exogamy among the uncivilized and among the civilized is that in the clan stage of social organization it is not blood relationship in our sense which counts, but the type of social organization itself.

Marriage Among the European Peoples.—Among the early Aryan peoples of Europe marriage was universally regarded, so far as we can discover, as a religious bond, since their family life was based upon ancestor worship. This early Aryan view of marriage gave way in later Rome to the view that marriage was a private contract, to be made and dissolved by the parties at their pleasure. The early Christian Church combatted this view of the marriage relation and sought to restore the view that marriage was a religious bond, which it finally did by making marriage one of the sacraments of the Church. It was forced, however, to still recognize that consent or contract was the essential means of entering the marriage relation. "Consent marriages" continued to be recognized, therefore, though they could not be broken except through the authority of the Church. The Protestant reformers put forth the idea that marriage was a civil relation, rather than a religious bond or sacrament, to be created by the state and broken by the state. In reaction to this view the Roman Catholic Council of Trent in 1563 declared that a valid marriage could only be created by the Church and only annulled by the Church. This still remains the Roman Catholic view of marriage. The later Roman view that marriage is a private contract, to be created and broken by individuals as any other contract, has shown a tendency to revive in modern nations among many elements of their population. The present problem of the family, therefore, centres about the question of divorce and the toleration of other forms of marriage than that of permanent monogamy. (See article on FAMILY, HISTORY OF). The last three theories mentioned are evidently held alongside of one another by different elements in the populations of modern nations. Which of these competing theories of marriage will become established in the moral standards of the future it is too early yet to say.

CHARLES A. ELLWOOD,
Professor of Sociology, Duke University.

MARRIAGE, The Law of. When the cave man wanted a mate he took her, and he was not very particular where he got her. His next neighbor's cave, indeed, would be the most convenient and likely place. It was a mere question of brute strength; the man of greater physical power had his way. As social evolution progressed and families were established and organized into clans, the man who preferred to gain a wife by capture had to go further afield. To have forcibly taken a woman of an allied family, or from an affiliated clan, would have brought down upon the offender the vengeance of an entire community and, against this, individual force could not prevail. Wife capture had to be practised against hostile tribes, from whose vengeance the robber would be protected by the whole of his own community. The Roman legend of the rape of the Sabine women points to a time when wife capture from unrelated and, therefore, enemy communities was a common practice. Probably robber-marriages persisted, to some extent, even in the home circle, so to speak. Among a number of semi-barbarous nations marriages still take the outward form of abductions. Before the leveling influences of Russian civilization had almost completely obliterated their tribal customs, wife captures were regularly staged by the Kirghis of the steppes. The bride, mounted on a swift horse and carrying her dowry, rode furiously out of her father's camp and the bridegroom gave chase. He was expected to catch her before dark, and he always did — that was part of the comedy. The whole performance was *camouflage* for the pur-

*The tribe being a group of related clans speaking the same language.

pose of covering up the real transaction, which was nothing else than a bargain and sale. Marriage by purchase was evolved, almost inevitably, from marriage by capture; the prospective husband paid a price to the family of the prospective wife for the privilege of carrying her off. Sometimes the abduction preceded the payment of the purchase price, the latter being disguised as a fine subsequently amerced to atone the "offense." In some instances, as under the early Roman law, the woman was adopted; she came under the fatherly power of the husband and, theoretically, became his daughter. In other times and places marriage was frankly a sale. In all cases the wife became the property of her husband and, at the worst, she was his drudge or slave. The tutelage, which was exercised over a woman throughout her life (even after her marriage) by the males of the family in which she was born, was intended to be protective of her honor and that of her family, as well as of her share of the patrimony of family property. An instance in point is the Levitical law, which permitted the father of a bride, put aside by her husband on charge of unchastity, to proceed against the accuser, and, the accusation being disproved, compelled the offender to expiate the wrong by keeping the woman as his wife all the days of his life. The actual condition of the wife was not as hard as might be implied from her legal status, or lack of legal status. The injunction to obey the father is coupled with the injunction to honor the mother. In the great Oriental monarchies of antiquity marriages were undisguisedly commercial transactions; the bought wife of a citizen of Babylon, however, was the manager of her husband's house and she was habitually consulted in serious matters of business. She was conferred with even in affairs of state if her husband happened to be a public official. A free woman, though married, might occupy a public position and hold separate property. Primitive communities do not clearly distinguish between custom and law or religion and morals; but in course of time a strictly religious form of marriage might be substituted for contractual marriage in any given community. The contractual or purchase marriage itself has a tendency to become symbolical and dramatic. The pledge given by the wooer to bind the bargain might originally have been a cow (domestic animals were real money, cattle or chattels and *pecunias* were words of identical meaning). This was later on represented by a gift to the bride — a bracelet, jewel or other token. The "giving in marriage," i.e., the consummation of the sale of the woman, would be accompanied by conventional words and gestures, dancing and music. Sometimes a wooer made payment in personal services, as Jacob tended father Laban's sheep seven years for Rachel; and in this, as in other cases without number, the marriage was a matter of mutual inclination. The bride usually received from her father a dowry or *dos,* which passed to the husband and remained under his control during the continuance of the conjugal relation. Among the Jews and Oriental nations in general marriages were terminable by divorce at the will of the husband. Among the Romans they were terminable at the will of the wife's father or by mutual consent of the parties. In either case the bride's dowry was returned. The re marriage of widows was not forbidden, bu was disfavored. Under the Babylonian law th consent of the courts had to be obtained an provision made for the care of the childre and household of the deceased husband. Monog amy and polygamy often existed side by side even in highly developed human societies. O the two great cultural races, the Semites hav given distinct legal sanction to plurality o wives. Polygamy was practised by the He brews in the patriarchial stage, though th practice fell into abeyance in later times Aryan institutions seem to be based on monog amous marriages. For obvious reasons monog amy must be the usual state in all communities whatever may be the law. Relatively few mem bers of a community have the power to gai or the ability to maintain more than one wife While a man individually might capture a woman of a hostile tribe and make her hi lawful wife, captives of war became slaves Among Oriental nations the children born t free men of their slave women or "hand maid ens" were considered legitimate and free Among the theoretically monogamous Aryan the opposite was the prevalent rule.

The marriage by appropriation and the result ing guardianship — or, more plainly speaking ownership — of the wife by the husband, doe not comport with the sociological thesis tha the institution of the patriarchate was precede by the matriarchate as a form of family organ ization. The practice of polyandry is rare even among savages, and where it is observe among people of culturally higher stage it in dicates degeneracy more probably than primi tiveness. In Tibet polyandry is evidently a outgrowth of the group marriage — the mar riage of all the daughters of one family a a group with all the sons of another family The plural husbands of polyandrous Tibetan women are invariably brothers. A rather fre quent form of primitive marriage is that when the husband is adopted into the tribe of th wife. That in such case the patriarchal au thority would be less pronounced than other wise is not evident, however. The male adopte into a tribe would assume the tribal name an be on the same footing with the males bor therein. Within a clan blood kinship is trace through females; but it is not necessary to pre sume the matriarchate as an antecedent socia order to account for this. The maternity of child is determinable with so much greater certi tude than its paternity that the tracing of kin ship through the mother would commend itsel for its convenience. Moreover, in those clan where this method of reckoning is customar the family and tribal organization is invariabl patriarchal. Practically without exception th nations which have become the leaders in cul ture have erected their social structure on basis of monandrous marriages and agnati kinship. The wife is taken into the husband' *gens,* clan or house, and her children becom members thereof and are given the famil name of their father. In the matter of inherit ances cognizance was usually taken only of rela tionship in the male line. A daughter migh inherit from her father, but if she died befor he did her children would take nothing b

representation; hence the importance of the *dos* or marriage settlement. By neither the Roman nor Teutonic rule of consanguinity was a man's sister's husband of kin to him and the suggestion of a prohibited degree of relationship between himself and a deceased wife's sister would have sounded queer to Cæsar or Cicero. The Levitical law took more account of blood relationship through females and made even a man's stepmother his cognate in blood. Stepbrothers and stepsisters could not intermarry, though they had no parent in common. It also forbade marital communion between certain other persons whose affinity was merely legal — as between a man and his uncle's widow or with his daughter-in-law. It forbade marriages of near relations to the third degree of blood kinship on either the maternal or paternal side — and this rule has prevailed throughout the Christian world. According to the Levitical law a man should not bring his sister-in-law into his house as a rival to his wife, but there was no prohibition with a deceased wife's sister and a man was expected to be a husband to the childless widow of his brother.

In the earlier period of their history the Romans recognized three kinds of formal marriage. The religious form, *confarreatio,* or "marriage with the bread-offering," had to be solemnized by the Pontifex Maximus in the presence of 10 witnesses and was reserved to themselves by the old patrician families. Among the plebians espousals took the form of a purchase, *coemptio,* which is defined by Gaius as a mutual mock sale of the parties, whereby the wife was freed from *tutela legitima* and *sacris familiæ* — tutelage to her male relatives and contributions for the maintenance of certain religious rites in her husband's household. The third form, *usus,* though held in little respect in the earlier period, ultimately became prevalent in all social ranks. Either by confarreation or coemption the woman given in marriage passed *in manum viri,* literally into the hands of the man, her husband, who acquired rights over the person and property of his wife greater, on the whole, than have been, or are, conferred by any modern system of law. He controlled her *dos* and other possessions absolutely during his life and continued his wardship after his death through guardians appointed in his will. The *usus* ripened into a perfect matrimonial bond only by prescription and after continued cohabitation for an entire year. In the meanwhile the husband's marital despotism was in abeyance. By simply absenting herself from the matrimonial domicile for one day in each year the *usus* wife could indefinitely postpone and defeat the acquirement of tutelary and possessory rights by the husband. On the other hand, the later law reduced the tutelage of the male in over the women of their family to a mere formality. By contracting a usus marriage, therefore, the women of Rome were enabled to evade both the paternal and matrimonial tyranny, under which they had been placed by the earlier law. In fact, at the most splendid period of Roman greatness married women enjoyed a freedom with respect to their persons and property such as they have not enjoyed anywhere since then. Most important of all was the establishment of the principle that marriage rested upon the consent of the parties — *concensus, non concubitas, fecit nuptias* — and might, therefore, be dissolved at the pleasure of either party. While the marital union was admitted to involve a sharing of all for life — *consortium omnis vitæ* — this was declared to mean a voluntary, not a forced, partnership. To hinder a separation when a consensus had ceased to exist was regarded *contra bonos mores,* in plain English, "immoral."

Early Teutonic marriage law did not differ greatly in fundamentals from that of Rome. Though disguised by ceremonials the transaction was essentially a barter. In the original and crudest form the custom was to give the father so much for his daughter, the price being fixed in accordance with the wealth and rank of the families participating in the treaty. The contract was made handfast, just like any other bargain, by a pledge or part payment. In progress of time this pledge, *vadium,* took the form of an ornament of more or less value presented to the bride at the betrothal — in modern practice an engagement ring. In time also the *arrha* (purchase money) became a gift to the bride instead of a payment to her father, though the latter retained it in trust for his daughter. The payment of the marriage settlement — and this the *arrha* was in effect — might be postponed during the lifetime of the husband, on his giving security for the transfer of an equivalent out of his estate to his widow. The purchase price for the bride thus became dower in form as it had always been in essence and in intent. Some early Teutonic laws distinctly sanctioned the "robber-marriage," which was nothing more than an abduction, or, the bride being willing, was simply an elopment. The penalty the abductor was required to pay to the outraged father was usually identical in amount with the prescribed amount of the settlement or dower in the more orderly form of wedding — indicating that barter marriage and robber marriage stood on about an equal footing of respectability. The Teutonic maiden when given in marriage was usually provided with an outfit for housekeeping and a dowry. Possibly an abducted bride would receive neither, which may be the reason why abductions were sometimes accomplished by connivance of the bride's family. In modern days elopments are often similarly motivated. There is nothing new under the sun, even in marriages. Betrothals in a regularly arranged ancient Teutonic marriage were attended by festivities on a scale comparable with those attending the wedding itself. Indeed, some investigators of primitive law insist that the troth-plighting was not a mere promise to marry but was, in verity, the contract of marriage. The giving of a pledge (*vadium*) to bind the bargain would indicate to a person exercising ordinary common sense that the betrothal was no more than an executory contract. It created an obligation to wed but did not actually establish a marital relation. The disputations on the subject have the appearance of mere quibblings with words. To be sure, if one buys a thing to be delivered to-morrow and pays part of the price, a sale has doubtless taken place. Of course, a delivery is necessary to complete the transaction; and, if the thing purchased be a cow, it might be said that she is not under complete dominion

of the new owner until he has put her into his stable and locked the door. Possibly some such mental kinks is responsible for the suggestion of other investigators of ancient Teutonic customs that *concubitus* was a legal essential to the consummation of a marriage. Be that as it may, the idea of a threefold stage in the process of acquiring a wife — the troth-plighting, the wedding and the consummation — has persisted in legal phraseology and has colored even very modern legal conceptions. Early Teutonic law permitted a husband to put aside his wife for adultery or barrenness, and it seems to have countenanced dissolution of the matrimonial bond by mutual consent.

From the very outset Christianity set its face against the looseness of the later Roman law respecting marriage. The legislation of the Christian emperors shows a reaction against the extremely liberal doctrines of the Antonine jurisconsults. The prevalent state of public opinion explains why, in the fusion of patriarchal practices, Roman jurisprudence and barbaric usages, so many retrogressive customs of the latter respecting the position of women should have found their way into the new alloy. The principles of the Roman law prevailed in so far that unmarried women were relieved of bondage to the family after attaining their majority. But the position of married women became fixed in barbaric archaisms and the husband drew to himself all the powers that had belonged to the wife's male kindred. The Church declared marriage to be a sacrament and the consequence was the enunciation of the doctrine of the indissolubility of the matrimonial union except by death. Through the decretals, through its influence on the customary law in the matter of dower and through the assumption of jurisdiction by the ecclesiastical courts over matrimonial questions, the Church established a universal marriage law throughout the Christian world. The canonists accepted the principle of the Roman law that the consent of the parties is essential to the making of a legal contract of marriage, just as it is to the making of any other contract. The lack of free consent, because of a material error in fact or because of physical or moral duress, or because of natural or legal incapacity of one or both of the parties (impotency, insanity or minority) were declared insuperable impediments to the execution of the contract, and grounds for its annulment if executed. From the Roman law also the canonists carried over into their system the age of consent — 14 for males and 12 for females — but they rejected the requirement of parental consent. In seeming contradiction to this, the father still "gives away" the bride in the marriage service. The Roman idea, that betrothal (*sponsalia*) was merely a promise to marry, was modified under the influence of Teutonic usage, by which the troth-plight was considered to have created the relation of husband and wife. Ultimately the canonical law made a distinction between *sponsalia de futuro* and *sponsalia de præsenti.* The former was declared a mere promise; but a present agreement (*accipio*) was held to constitute a valid marriage. Such a marriage if not consummated was dissoluble, however, either by a vow of celibacy taken by one of the parties, or by special dispensation. The troth-plighting in the marriage service and the wedding of the bride with a ring may be reminiscences of the Teutonic hand-fasting and the payment of the *vadium* or pledge, while the marriage settlement looks very much like a modern variation of the transfer to the bride of the *arrha.* Formidable impediments to marriages within the family, even between very distant relations, were created by the canons of consanguinity and affinity. The degrees of kinship were measured from the common male or female ancestor downward in collateral lines of descent. Each successive generation being but one degree further removed from the source of the blood, persons might stand in close relation to each other, though wide apart collaterally. Second cousins, for instance, were akin in the third degree by the canon, though the Levitical and Roman law would both place them in the seventh degree. The earlier Church canon forbade intermarriage down to the seventh degree, so that sixth cousins could not enter into matrimonial relations with one another. In the later Church law the prohibition ended with the third degree canonical, or with second cousins. Relations by affinity or marriage were laid under similar disabilities as blood relations. Sisters-in-law and brothers-in-law were as incapable of contracting marriages as natural brothers and sisters; likewise the children of husbands and wives by former marriages. These prohibitions conform to a sense of delicacy and they accord with a not unreasonable interpretation of the Levitical canon. But a reason for tracing relationship of any person to an uncle by marriage and to his children by a former wife and these children's children is hard to discover. Nevertheless, these canonical restrictions were not without salutary effect. The practice of intermarriage between kindred, in order to keep property within the family, had become prevalent not only among the nobility but in all ranks. Near relationship in blood or by marriage might exist among the entire population of a small commune, and such cases were not exceptional under conditions of life that did not encourage travel or changes of habitation. By compelling men and women to seek mates outside their own little circle, the Church set a wholesome limit to inbreeding. The habitual shifting of population and the great freedom of locomotion in modern times have made the extreme restrictions of the canon law quite dispensable. The Reformation produced important changes in the law of marriage. The Council of Trent pronounced clandestine marriages of minors to be nullities and required the presence of two witnesses in all cases. The Protestant ecclesiastical law denied the indissolubility of the matrimonial bond and regarded all betrothals as, presumably, *sponsalia de præsenti.* The words, "I will," Luther remarked, did not, in the Teutonic language, express a future intention but a present purpose; unless qualified so as to introduce an element of uncertainty any promise to marry, followed by cohabitation, was to be considered a valid marriage. Indeed, cohabitation in conjugal relation was quite generally regarded presumptive evidence of a marriage *per verba de præsenti,* though the presumption was not conclusive. By acts of Parliament passed in the second half of the 18th and the first part of the 19th centuries,

urch weddings were required in all cases and marriages not thus celebrated were declared id. Informal marriages, however, were still od in Scotland; and this circumstance exins how Gretna Green became a Mecca for naway lovers. The statute of George II also de the parent's or guardian's consent essenl to a valid marriage; but this requirement s rescinded later on. A statute of Henry II had adopted the Levitical canon as the le for reckoning degrees of consanguinity England. This permitted marriages between st cousins and persons of more distant relanship in blood, and it abolished, or was inded to abolish, all disabilities growing out affinity or relationship by marriage. The urch of England, however, continued to the t in opposition to marriage with a deceased fe's sister, and still insists upon the indisubility of the matrimonial bond except by e death of one of the parties.

In the eye of the modern law marriage is imarily a civil relation. Most of the European codes and, with one or two exceptions, en those of Catholic countries, make a civil arriage and the registration thereof in the blic records indispensable. A religious ceremony may follow at the option of the contracts, but is not legally essential. A relation eslished by the civil authority can, of course, dissolved by the same authority. Adherence the doctrine of the sacramental character of arriage has become a matter of conscience; e law will not force obedience to the same. ne modern law has generally raised the age consent and has made the consent of parents guardians necessary to the validity of the arriages of minors. All marriages must be blicly contracted. In England the requisite blicity may be obtained either in accordance th the rites of the Established Church or ner religious denomination, or in accord with e rules made by the public registrar or by tute. Betrothal almost everywhere is now nsidered merely a promise to marry, and acns to recover damages for a breach of the omise are permitted in only a few countries. ne dissolution of marriages by consent of the rties is, generally speaking, disallowed, but nost everywhere divorces may be obtained by ocess of law — in Austria only between nonholics. The powers of married women to al with property vary considerably. In some the French provinces the pre-Revolutionary *utumes* gave to married women, below the nk of nobility, nearly all the independence ich Roman jurisprudence in its final stages d allowed them. These local customs tother with parts of the Roman law became the sis of corresponding provisions of the Code poleon and through the latter and to some tent the Spanish law have affected the law of uisiana and a few other States of the Union. usband and wife by this law acquired no genal interest in each other's property on marge. The only property the wife brought into e matrimonial pot was her *dot,* or dowry, ich is in the nature of a wedding gift from r family. While the husband did not become e owner of the *dot,* he had the use of the me during the continuance of the marriage. e husband could even sue the wife if she dered him in the enjoyment of the usufruct reof. Every species of property owned by the wife at the time of marriage or subsequent thereto could become the subject of a dotal gift. The most interesting disposition of property permitted to husbands and wives, however, was the creation of a *communio bonorum.* The principle of the *communio bonorum* is that husband and wife shall have no property apart from one another. All that either of them owned at the time of, or before, their marriage, and all that either or both together acquired while living in the marital relation, was included in the communal property. As in the case of a partnership in business, the community property could not be made answerable for the individual obligations of the parties to a *communio bonorum* until all joint obligations had been satisfied out of the same. The husband became the managing partner or curator, however; the wife is excluded from every case in which her acts cannot be referred to an express or implied authority of the husband. The latter incurs all debts or charges for the community. The community ceases on termination of the marriage relation either by agreement, divorce or death; in the latter event the rights of the survivor are fixed by law. The *communio bonorum* is a form of marital partnership recognized not only in Louisiana, but in Texas, Florida, Missouri, California and other States carved out of territory once in French or Spanish possession. The principle has been greatly modified under influence of the common law and the modern statutes respecting the separate property of married women. The *communio bonorum* exists by legal presumption only with respect to property acquired during marriage, or in the name of either husband and wife, including the produce of their reciprocal industry and labor. The presumption may be rebutted by proof that any property so acquired was intended to be acquired as separate estate. Separate property brought into the marriage by either party forms no part of the community, except by express agreement; nor does property acquired after marriage by gift or inheritance.

In the United States a marriage may be either religious, civil or quite informal. Civil marriage was authorized, or required, in all the New England colonies. Milton's tractate on divorce and his denunciation of ecclesiastical «meddling» with marriage had borne fruit in the Civil Marriage Ordinance of Cromwell, passed in 1653. By this ordinance obligatory celebration before a justice of the peace was instituted, and a system of lay notice, certification and record was established. The action of the Puritans and Independents in England found ready followers in America. The States-General of the United Netherlands in 1656 adopted the principle of an older law of the provinces of Holland and Friesland, which had established a permissive form of civil marriage soon after their independence of Spain was achieved, and this naturally passed over into the law administered in New Amsterdam. For years the celebration of a marriage before a clergyman, as such, was illegal. Religious marriages were sanctioned later on throughout New England, and long before the close of the colonial era the dual civil and religious system was established, which has since prevailed. The «common-law» marriage, still recognized in most of the States, is nothing more than the canonical

sponsalia de præsenti under another name. Any agreement to marry *per verba de præsenti*, which is followed by cohabitation as man and wife, constitutes a legal marriage. A presumption of marriage is raised when the parties have lived together in marital relations, have acknowledged themselves (or have been generally reputed) to be husband and wife. This presumption, of course, is not conclusive and may be rebutted. A relation, originally meretricious, will not be transformed into a marriage by a mere informal agreement. This also is in accord with the canonical law. In all the States formalities attending marriage are prescribed by statute. Licenses to marry must be obtained, and the publication of the issuing of a license gives some sort of publicity, as does the requirement of the presence of witnesses and the making of marriages matters of public record. The persons who may perform the ceremony, clergymen or civil officials, are designated. The clerk issuing the license must be satisfied, by affidavit or otherwise, that there are no legal impediments to the marriage, and, in cases of minors, the consent of parents or guardians is usually required. In most of the States, however, the statutory requirements have been held by the courts to be merely «directory» and not mandatory. Non-conformity may involve the non-conformers, and the officials and ministers concerned, in legal penalties; but the marriage is not invalidated. In Massachusetts, however, the courts have always insisted upon the observance of the statutory formalities, declaring such observance to be essential to the validity of a marriage. The Massachusetts rule has been followed in some States and in others the statutes are mandatory. For either of these reasons the «common-law» marriage may be deemed to have been abolished in California, Illinois, Kentucky, Massachusetts, Missouri, Maryland, North Carolina, Vermont and West Virginia. In New York (since 1901) non-ceremonial marriages must be evidenced by a written agreement, signed in the presence of two witnesses and acknowledged in the same manner as a conveyance. The effort to secure the adoption by the States of a uniform marriage law has, thus far, been unsuccessful, and the greatest diversity continues to exist. Moreover, the general rule, that a marriage which is legal in the place where it is established will be regarded as formally perfect everywhere, permits the parties to evade inconvenient requirements of the laws of the place of their domicile by going out of the State to make the contract. The age of consent varies in the States, ranging from 16 to 21 years for males and from 14 to 18 years for females. Where the statutes are silent the canonical prescription of a minimum of 12 years for females and 14 for males still holds good. Infant marriages are voidable at the option of parents or guardians, if contracted without their consent. When any of the essential ingredients of a contract are lacking the marriage agreement, like any other contract, is a nullity. Consent being an essential, when one party or both have insufficient mental capacity to give intelligent assent no valid marriage can result. A misunderstanding as to a vital fact will avoid the contract, but only if the mistake was of such a character that there could have been no real consent. Duress excludes volition, and there is no such thing in law as involuntary consent. Impossibility of performance avoids the contract. Impotence, meaning want of physical capacity, makes marriage a nullity; but sterility does not. The marriage of a person having a living and undivorced former spouse is a nullity. Null and void also are marriages between persons in the prohibited degrees of consanguinity. All States forbid marriages between blood relations in the direct line of descent or ascent and between brothers and sisters of the half blood as well as of the full blood. All States forbid marriage between uncles and nieces or nephews and aunts and in 20 States the prohibition extends to consanguines within the fourth degree, which bars marriage between first cousins. Affinity through marriage among collaterals is usually disregarded, but in the ascending or descending line, as between step-father and step-daughter or between father-in-law and daughter-in-law the prohibition is frequent. In 25 States whites and negroes are forbidden to intermarry, the laws often defining to a nicety the fractional part of African blood which vitiates the marriage. In five States the prohibition extends also to the marriage of whites with Chinese or other Mongolians, and in four States marriages between whites and Indians are forbidden. In recent years legislation on the subject of marriage has been affected greatly by eugenic considerations. In Connecticut and Minnesota epileptics and feeble-minded persons are not permitted to marry and similar statutes have been enacted in other States as have laws prohibiting the marriage of persons afflicted with venereal diseases. Under these statutes those intending marriage must first undergo a physical examination before a marriage license is granted. These examinations include all of the rigid tests known to medicine. A woman on marriage usually takes her husband's nationality.

STEPHEN PFEIL.

MARRIAGE OF FIGARO, The ('Le Mariage de Figaro'), Beaumarchais' most popular play, possibly the wittiest and politically the most effective of all dramas, was ready for the stage in 1778, three years after the success of 'The Barber of Seville' (q.v.), to which it was a sequel. But even while in manuscript it

ecame the centre of intensely active and com-icated political intrigue. Louis XVI rightly scerned in it danger to his throne, and it as not publicly presented till 1784, when it hieved a success till then unparalleled, being strange irony most applauded by the aristo-atic class whose ruin it portended. To Napo-on, after the event, it seemed "the Revolu-on already in action," and it certainly con-ibuted greatly to hasten and provoke by its veling tendencies the disintegration of the nventions and even the foundations of the d social régime, though this seems the result ther of Beaumarchais' delight in his own wit, mere wantonness, than of a realization hither his work was tending or of any delib-ate revolutionary purpose. Figaro in 'The arriage' is still the light-hearted, versatile, ilosophic scapegrace of 'The Barber'; Al-aviva and Rosine are what that play would ad one to expect they would be after some atrimonial disillusion. Of the new characters uzanne, on whom Almaviva has set his grant fancy and Figaro his heart, is genially nceived, and Chérubin, the page and disquiet-gly precocious gallant, was a really daring eation, provoking reprobation and inviting ntroversy. Figaro is successful in defending s beloved from the wiles of Almaviva, but it as been not unjustly said that if the object of medy is to make vice ridiculous or odious or ntemptible 'The Marriage' can hardly claim attain it. Universal mockery, supremely vacious, a wit whose brilliancy puts morality f its guard, mar ethically a drama whose stained excellence in dialogue had been hardly tained even by Molière. The best edition of e Mariage de Figaro is in 'Théâtre de eaumarchias,' edited by d'Heyli and Marescot Vol. III). For the circumstances of its writ-g, prohibition, reception and contemporary iticism, consult Loménie, 'Beaumarchais and is Times' (Vols. III and IV), also 'Le Cen-naire du Mariage de Figaro,' edited by A. aër (Brussels 1884). The play furnished the xt for 'Le Nozze di Figaro,' a popular opera Mozart (1786).

BENJAMIN W. WELLS.

MARRIED WOMEN, Legal Status of. ee HUSBAND AND WIFE.

MARRIED WOMEN, Right to Conduct usiness. See HUSBAND AND WIFE.

MARROW, a substance of soft vascular ssue filling the cells and cavities of the bones mammals. It contains fat and both red and hite blood corpuscles and is a valuable con-ituent of soups. The bone contents of mam-als show wide variation. The largest con-ituent is usually water, but some marrows, as the long bones, are mostly a yellow oil. races of albumen, fibrin and salts are also ound. Red bone-marrow is highly nutritious id is recommended for anæmia. (See BONE). he vegetable marrow is a species of squash *Cucurbita ovifera*), of oval form, ribbed and reenish-yellow color.

MARRYAT, măr'ĭ-ăt, **Florence,** English ovelist, daughter of Frederick Marryat (q.v.): Brighton, 9 July 1838; d. London, 27 Oct. 899. She was successively Mrs. Church (1854–0) and Mrs. Francis Lean. Her many novels, though not at all remarkable, were popular, id were published in various versions through-out Europe. They include 'Nelly Brooke,' 'Fighting the Air,' 'Facing the Footlights' and more than 80 others, many being devoted largely to spiritualism. She published and edited her father's 'Life and Letters' (1872).

MARRYAT, Frederick, English naval of-ficer and novelist: b. London, 10 July 1792; d. Langham, Norfolk, 9 Aug. 1848. In 1806 he entered the navy, served on the coast of North America in 1811 in the *Æolus,* and in 1823 was commander of the *Larne* during the first Burmese War, in 1825 had the naval command of a successful expedition up the Bassein River, and in the same year was made captain of the *Tees.* From 1828 until his resignation in 1830 he commanded the *Ariadne.* He received the gold medal of the Royal Humane Society (1818) for saving life at sea; adapted to the mercantile marine Sir Home Popham's system of signaling; was elected Fellow of the Royal Society in 1819, and was also something of a caricature artist. He is best known, however, for his stories of the sea, beginning in 1829 with 'The Naval Officer.' The most familiar of them is 'Midshipman Easy' (1836), in which his chief characteristics, lifelike and circum-stantial narration and a rollicking humor, ap-pear perhaps at their best. Others of the series are 'The King's Own' (1830), probably the best constructed of his works; 'Newton Forster' (1832); 'Peter Simple' (1834); 'Jacob Faith-ful' (1834); 'The Pacha of Many Tales' (1835); 'The Pirate, and the Three Cutters' (1836); 'Snarleyyow' (1837); 'The Phantom Ship' (1839); 'Poor Jack' (1840); 'The Privateer's Man' (1846). He wrote also a series of juveniles, chief of them 'Masterman Ready' (1841). He visited Canada and the United States in 1837–38; and recorded his im-pressions in 'A Diary in America' (1839), which gave some offense to the people of the nation, then hypersensitive to foreign criticism. In 1832–35 he edited the *Metropolitan Magazine,* in which he published a review of N. P. Willis' 'Pencilings by the Way,' which the latter, then in England, considered abusive. Willis chal-lenged Marryat, and they exchanged shots at Chatham without injury. (See MIDSHIPMAN EASY, MR.). Consult Marryat, F., 'Life and Correspondence' (1872); Hannay, 'Life' (in 'Great Writers' series).

MARS, Anne Françoise Hippolyte Bou-tet Monvel, än fräṅ-swäz ē-pō-lēt boo-tā môṅ-vĕl märs, usually called MADEMOISELLE MARS, French actress: b. Paris, 5 Feb. 1779; d. there, 20 March 1847. As Célimène in Molière's 'Misanthrope,' and Elmira in 'Tartuffe,' as well as in several similar characters in the plays of Marivaux, she was very great. Louis XVIII settled on her, as well as on Talma, a pension of 30,000 francs. She retired in 1841.

MARS. Mars is the fourth planet from the Sun, its orbit being considerably more eccentric than the Earth's. The eccentricity is exceeded only, among the nine large planets, by that of the orbits of Mercury and of Pluto, and amounts to 0.093, while its mean distance from the Sun is 141,500,000 miles. This large eccen-tricity causes considerable differences in the planet's distance from the Sun, the change being from 128,300,000 to 154,700,000 miles at peri-helion and aphelion respectively. As the orbit of Mars is wholly outside ours, Mars may ap-

proach us, under the most favorable circumstances, to within 34,600,000 miles at opposition, i.e., when the planet is on the meridian at midnight and hence most advantageously placed for observation, while it can recede to 250,000,000 miles when it is behind the Sun. At an average opposition, however, Mars is 48,000,000 miles distant. Its magnitude therefore can vary from -2.8 to $+1.6$, which amounts to a change of 55 times in brightness. The siderial period of Mars contains 687 of our days, but its synodic, from one conjunction to the next, is 780 days. Though Venus approaches us more nearly, yet this happens when Venus is between us and the Sun and hence unobservable. Mars, on the contrary, is most favorably placed when nearest, and therefore can be observed under better circumstances than any planet. Despite this fact, as the planet has an atmosphere, there is a very slight uncertainty in its diameter, due to the difficulty of exactly allowing for the height of this atmosphere over the solid surface and for the effects of irradiation. The value usually accepted is 4,206 miles; photographs in yellow light however give 4,240 miles. Results at the Lick Observatory, largely due to W. H. Wright, give a value for the solid globe of 112 miles less than this. This implies an atmosphere which is appreciable enough to show up on the photographs 56 miles above the surface. It must be understood that this is by no means the probable height of the whole atmosphere, the upper and less dense parts of which probably are not recorded on the plates. The apparent diameter varies from 3″.5 at conjunction to 25″.1 at a most favorable opposition. It can at once be seen that when nearest an angle of 1″ at the distance of Mars corresponds to 168 miles. Obviously then an object subtending an angle of 0″.1 is 17 miles wide, and, as this approaches the smallest angle that can, under perfect conditions, be seen using the largest refracting telescopes in existence, it needs no further argument to show the impossibility of seeing really small surface features on Mars. For instance, the Himalayas would be less than 0″.04 high on the limb of the planet, an angle quite undetectable with any telescope. It therefore seems very strange that many books assert the planet has a relatively smooth surface, for even our highest mountain ranges, if there, would not show up directly. Also, as the shadows are not sharp as on the atmosphereless Moon, it is very doubtful if we could detect them by means of the shadows they cast, though with a low Sun these latter would much exceed the angular heights of the mountains themselves, when on the planet's limb. Even the effects of sunrise or sunset on the tops of mountains, just beyond the terminator, would be difficult to detect, due to the greater thickness of the Martian atmosphere through which we would have to observe them in this twilight region.

The mass of Mars is 0.108 that of the Earth, or about one three-millionth that of the Sun. Its density is 4.0 times that of water, and bodies on its surface would weigh only 0.38 what they do with us. This latter means that, could a man be transported to Mars, keeping his muscular strength and suffering no ill effects, his weight would be only 38 per cent of what it is on the Earth, and he would be able to accomplish far more with less effort. It also proves that the «velocity of escape» for gases is much lowe for Mars than for the Earth, and hence tha planet would be less able to retain gases in i atmosphere. The lighter ones would largely o wholly escape. It is calculated that Mars re flects about 15 per cent of the Sun's light fal ing upon it, which means that it has twice a good a reflecting surface as the Moon. Y even this reflecting power corresponds only t that of dark rocks. The greatest deviation fro the full phase is the gibbous and when nea quadrature the disk is far from circular. Ma is usually brighter near the limb than in i center, but not along the terminator. The plan is also slightly flattened at the poles, and theo retical reasons make us believe that it is th most nearly homogenous of all the eight plane which can be studied—Pluto is too small to b measured. The equator of Mars is incline about 24° to the plane of its orbit; this mean it has seasons exactly like our own. The da on Mars is 24 hours 37 minutes 23 seconds long therefore, only about half an hour longer tha the day here. Hence, so far as diurnal and sea sonal phenomena are concerned, we find a strik ing similarity with our Earth. The amount o heat received per square mile on Mars averag 44 per cent of that we receive, but due to th eccentricity of its orbit at perihelion the heat 1.45 greater than at aphelion. The souther hemisphere of Mars now, as with us, happens t have longer and colder winters, with shorter an hotter summers, due to this cause.

The planet possesses two small satellites o moons: Phobos, distant only 5,800 miles fro the planet's center and making its complet siderial revolution in 7 hours 39 minutes; an Deimos, distant 14,600 miles, in 30 hours, minutes. Both bodies are small, probably le than 10 miles in diameter. They were disco ered in 1877 by Asaph Hall (q.v.) with th Washington 26-inch refractor, then the fine existing telescope. They can never be see through small telescopes, and only under goo conditions through the largest. Bearing this fa in mind, a most remarkable statement, made b Dean Swift in his 'Gulliver's Travels,' publish in 1721, must be mentioned. This was a centu and a half before anyone knew these satellit existed, and about a century before any instr ment was made with which they could possib have been seen. The quotation is as follows:

«Certain astronomers . . . have likewise di covered two lesser stars, or satellites, which r volve about Mars, whereof the innermost distant from the center of the primary plan exactly three of its diameters, and the oute most five; the former revolves in the space o ten hours, and the latter in twenty-one and half . . . which shows them to be governed b the same law of gravitation . . .»

When it is noted how very close Swift can to the truth, not only in merely predicting tw small moons but also the salient features o their orbits, there seems little doubt that th is the most astonishing «prophecy» of the pa thousand years as to whose full authentici there is no shadow of doubt. The nearness o Phobos to the planet's surface means that it ca never be seen from large areas in the polar re gions. Its period of less than eight hours oblig it to rise in the west and set in the east. In th latter respect it is unique among all bodies i the universe, so far discovered. Yet Swift ha

this fact also included. On account of their very small size, they can give little «moonlight» to the planet and only the phases of Phobos could be seen without optical aid. Phobos is so near the planet's surface that it would appear much larger when on the meridian than when rising or setting.

To the average eye Mars is red, but when a telescope is used, it is found that orange-red is the prevailing color of the disk. The reddish color of the planet, when the absence of an appreciable per cent of oxygen in its atmosphere is remembered, has led to the following suggestion. When terrestrial rocks weather, rust appears, which is the uniting in them of iron and atmospheric oxygen. Such rust is reddish. Can it be that most of the presumably scanty supply of oxygen on Mars has so disappeared, leaving a reddish soil as a result? There are, however, darker areas of various sizes as well as two easily discernible polar caps. In fact, these latter can be seen with a small telescope. The so-called canals appear first to have been announced by Giovanni Schiaparelli in 1877 and his maps of the planet, though made with a telescope of only 8.6 inches aperture, showed a wealth of detail never before equaled by observers. The darker markings are of a greenish-blue color and lie mostly in a belt south of the equator. They cover nearly 40 per cent of the surface. The most easily seen of these is a projection, not unlike India in shape, which reaches well in the northern hemisphere. This is so easily recognizable that it can be identified certainly on drawings by Robert Hooke and Christian Huygens made over 200 years ago, and when compared with modern observations is the basis for the extremely accurate rotation period. As the planet's day so nearly equals ours in length, the same features on its surface, at the same hour of observation on successive nights, are but slightly displaced. The reddish areas undergo little variation in appearance; changes occur mostly in the polar caps and dark regions. The cap, in the hemisphere where winter prevails, extends nearly half way to the equator, but as the Martian spring equinox approaches, the cap begins to shrink along its edges, rather uniformly, so that by the summer solstice it may be some 500 miles in diameter and later in the summer very much smaller. In fact, during some years, the southern cap has wholly vanished; the northern never entirely disappears though decreasing to 200 miles in diameter. After the autumn equinox, the white material again forms, generally in isolated patches and overnight. These eventually joining form the continuous cap which lasts throughout the winter. One of the proofs that the planet's surface is not wholly at what would be the equivalent of sea level is that the locality in the south cap where it is longest visible is not the pole itself but an area 250 miles distant. This area must therefore be at a considerably higher level. There are some other phenomena reported, over regions where the Sun has just risen, that resemble the actions of hoarfrost. It was once believed the darker areas were bodies of water; this is now admitted to be impossible as the reflection of sunlight is never seen from them, and their color, sometimes even their size, changes with the seasons or perhaps in different years. As a generalization, such regions are more prominent in the hemisphere which has spring; their tints fade or turn yellowish in autumn. In some cases, a brown color has been reported for winter.

Turning now to the canals, Schiaparelli announced the discovery over the reddish parts of Mars of numerous fine, dark, straight lines for which, in the original Italian article, the word *canali* was used. This word means *channels* as well as *canals,* but while the former signification seems to have been intended, the translation *canals* had a greater appeal to the imagination and hence was adopted popularly. In 1881 he announced many were double. In 1892 W. H. Pikering detected small spots, connected with the canals, and in 1894 A. E. Douglas noted canals in the dark areas also. Percival Lowell, the founder of the observatory of that name and an indefatigable observer of the planet, believed that he fully confirmed the straightness and narrowness of the canals, as well as their duplication. At Lowell Observatory over 400 were mapped. However, E. E. Barnard, perhaps the most skillful of all American observers, saw no such complicated geometrical system of fine lines, though he used the two largest of all refractors, those at Lick and at Yerkes Observatories, as well as the superb 60-inch Mount Wilson reflector. On the contrary, he reported shorter, wider, and more diffuse lines, and also many small dark spots; and further, that with the best seeing conditions a wealth of detail could be glimpsed quite beyond human skill to fully delineate. E. M. Antoniadi, working with the great 32-inch Meudon refractor in France, confirms the lack of fine, geometrical lines, and the presence of an infinite amount of small detail, glimpsed in the rare moments of perfect seeing. Other observers take a midway position. It may be asked at once why cannot all skillful observers, having the use of great telescopes, see the same thing? And further, why cannot photography settle the question? It will be remembered it was shown that, even when nearest, 1″.0 on Mars equaled 168 miles. It is difficult under ordinary conditions to detect a dark line on a bright planet which is less than 0″.2 wide, almost impossible if it is below 0″.1. These are equivalent to 34 and 17 miles respectively. For the lines to show up, as Lowell drew his canals, they would have to be from 15 to 30 miles wide, at least. When detail is near this limiting size, no two pairs of eyes see it exactly alike since it is always at the extreme limit of vision. It is therefore not strange that observers, straining their eyes to the utmost, often put in detail others do not see or draw it differently. Everyone can see the larger topographical features and all agree fairly well on their outlines. It is the finer details over which controversy occurs. As to photography, even with an enlarging lens, the size of Mars on the plate is very small. Photographs in great numbers exist that show the polar caps, dark areas, even areas temporarily shrouded by clouds, but no possible photographic technique comes anywhere near equaling trained human eye in ability to detect fine planetary markings. The reasons for this may not be discussed here for lack of space, but are perfectly well known. Hence photography is inadequate to prove or disprove the existence of the narrower canals. Lowell and some of those who agreed with his delineation of what they observed on the planet's surface aroused great popular interest because they believed the

canals had been dug by intelligent beings, seeking to conserve a pitifully inadequate water supply for their needs. It is but just to point out that these astronomers did not believe the canals themselves to be of the widths mentioned. Their idea was that the vegetation growing along the narrow channels would cause the effects they saw and recorded as narrow straight lines. An example would be an airplane picture at very great height over the Nile Valley. The river itself might not show up, but the strip of vegetation, going out to several miles on either side, would appear as a narrow dark line. The spring melting of the polar caps was thought to be the source of the scanty and precious supply of water.

Fantastic theories of supermen and a society which had evolved far beyond ours may be found in various articles and books published during the period from 1880 to 1920; since then, serious writers have become more conservative. This is due to more recent evidence as to the constitution of the Martian atmosphere and the actual measurement of the temperature of various localities. While the atmosphere was known to exist two centuries ago, only refined spectroscopic observations could show the presence of oxygen and water vapor, the two constituents considered essential to biological life. The earlier observations confirmed the presence of both, but in quite small quantities. More recent ones from Mount Wilson, however, made with more powerful spectroscopes, have failed to reveal any trace of either. It is but fair to say that this does not mean that absolutely no oxygen or water vapor is present; only that their amounts are less than 0.001 for the former and 0.05 for the latter, as compared with our atmosphere. Mars' spectrum is practically that of reflected sunlight only.

On the contrary, we have the evidence of the polar caps, covering large areas, and shrinking with the advent of summer, and by analogy we could assume them to be composed of snow and ice. Further, at times, details in restricted areas of the planet simply disappear from view, as though covered by fog, clouds, or a haze of dust. Lastly, actual clouds have been seen, in relief, on the terminator of the planet, at considerable heights above the surface. But clouds of this sort have been rarely noted, nor is the fog very often reported. Series of photographs have been taken in light of different colors, both W. H. Wright at Lick and E. C. Slipher at Lowell having had remarkable success. Certain facts become evident on examining these plates. First of all, the polar caps are more conspicuous in violet light, so much so that on some plates they actually seem to protrude from the disk. In this same light, however, all ordinary details of the surface practically disappear, and what remain visible have vague outlines. Also images taken in violet or ultraviolet light are measurably larger than those taken in red light. Wright compared pictures of Mars taken in two wavelengths with two of the landscape west of the Lick Observatory, using the same color screens. The distant terrestrial mountains are almost invisible in the violet, but every detail stands out in the infrared. As mentioned, somewhat the same effects are found for the Martian surface. This would imply considerable optical density for the atmosphere of Mars, which obviously allows rays of longer wave length to penetrate quite as with the Earth's. The difference size of the violet and infrared images shou then give a definite clue as to the thickness that part of the atmosphere where appreciab absorption exists. As stated, this value is abo 56 miles. With regard to the protruding pol caps, Wright is inclined to believe them, at lea in part, as cloud caps floating over whatev may lie beneath. Even if the white substan we see is snow and wholly on the surface, v know nothing of the thickness of the mantle. few inches covering the ground would look t same to us as would a layer a thousand fe thick. Other substances have been suggested, b most astronomers still believe there exists thin layer of snow, despite negative spectr scopic evidence as to water vapor. Most of t seasonal changes can also be explained in th simple way.

One of the indisputable laws of science that light and heat vary inversely with t square of the distance. As Mars averages abo 1.5 times as far from the Sun as does the Eart the quantity of heat received there per squa mile should be 4/9 of that received here. Tur ing this into temperature has technical but n insuperable difficulties. For Mars, the calculat extremes at mean distance would be —51° +43° C, the correct value probably lying betwe these limits. Measures made at both Lowell a Mount Wilson Observatories have agreed on t following: that along the sunrise edge of t planet we find the temperature about —10° —20° C, at the center of the disk (for noo from +20° to +30° C, and for the sunset ed —10° to +10° C. The values found for the pol caps vary enormously, the lowest being —70° In view of these figures, we may decide that t earlier conclusion of some scientists that Mar surface never is above freezing, i.e., 0° C, is i correct. Further, that at noonday temperatur are found which would be comfortable enou near the equatorial regions, but even there t nights must be very cold indeed. The Lowe measures show the dark areas are warmer tha the reddish ones, which Wright believes inim cal to the theory they represent areas of veget tion. Later measures at Mount Wilson confir that at aphelion the temperatures on Ma should be 27° C lower than at perihelion, whe the earlier measures were usually made. Ther fore, on the average, Martian temperatures a 14° lower than the values at perihelion and t various parts of the planet would be colder tha the values given above by about this amount.

In view of all the facts outlined we ma come to some fairly intelligent conclusions abo the chances for life existing on Mars. On t favorable side we find the length of day an the type of seasons approximately like our ow The lower surface gravity need not be a hand cap, and the planet's surface, while only 28 per cent of the Earth's, is still large enoug for a great population. Sunlight also is ad quate. On the unfavorable side we find a ten perature which is semiarctic. The atmospher of the planet, though extensive, is probabl tenuous. Also for life to exist as we know i and that is all we can discuss scientifically, t excessively low relative percentage of oxyge and water vapor, if not their total absence, seem to make all higher forms absolutely impossibl Nor is there good reason to believe there wer in «geologically recent» times, large quantiti

of these gases which have since so gradually disappeared that higher species could adapt themselves to their loss and still survive by modification of their lungs or other organs. Yet there seems some observational evidence that vegetation exists; at least, certain phenomena can be most simply explained in this way. Hence without venturing a positive opinion, there are grounds for this belief, and if vegetation exists, then low forms of reptile or other animal life might be inferred. But the supposition that higher forms exist, such as mammals, stretches one's imagination beyond any bounds which science can substantiate. The attempts at planetary intercommunication, even if there were beings to receive our messages, are not as yet subjects for serious consideration. The ideas advanced for travel from planet to planet are simply wildly imaginary and take no proper account of perfectly well-known facts and natural laws. Thus radio messages to Mars, much less reaching the planet by rocket ships or similar devices, are at present wholly beyond the limits of serious scientific study.

CHARLES P. OLIVIER,
Director, Flower and Cook Astronomical Observatories, University of Pennsylvania.

MARS, the legendary god of war; *in Roman mythology*, contracted from *Mavers* or *Mavors*, in the Sabine or Oscan language *Mamers*, was at an early period identified by the Romans with the Greek *Ares*. As the Italian Mars was originally a divinity of a very different nature, the two conceptions must be treated separately. Originally Mars was an agricultural deity surnamed *Silvanus*, and propitiatory sacrifices were offered to him as the tutelary god of fields and flocks. As the Italian shepherds were familiar with war, the transition from the idea of Mars as an agricultural to that of a warlike deity was natural and easy. He was regarded as the father of the Roman people, for, according to tradition, Romulus and Remus, the founders of Rome, were the fruit of his intercourse with Rhea Sylvia. Several temples in Rome and the Campus Martius were dedicated to him, the most important of which was that outside the Porta Capena, on the Appian Road, and that of Mars Ultor, built by Augustus in the forum. His service was celebrated not only by particular *flamines* devoted to him, but by the College of the Salii, or priests of Mars. The month of March (q.v.), the first month of the Roman year, was sacred to him, and his festivals were celebrated every year in the Circus on the 1st of August. The Campus Martius, where the Roman youth engaged in their athletic and military exercises, was named in his honor.

MARSALA, mär-sä'lä, seaport, Sicily, in Trapani Province, located on the Mediterranean near the mouth of the Marsala River on Cape Boeo (Lilibeo) 18 miles south of Trapani. It was known as Lilybaeum in the time of the Carthaginian supremacy. The seaport obtained its present name from the Saracens, who valued it so highly that they called it Marsa Allah (Port of God). There is a 16th century cathedral dedicated to St. Thomas of Canterbury, and traces of the early city walls. The modern harbor has been greatly improved. Most important export is Marsala wine, which is produced in the neighborhood; a white, sweet, strong wine, it resembles Madeira but has a distinctive, pleasing flavor and golden color. Grain, soda, and salt are among other exports. In 1860 Giuseppe Garibaldi (q.v.) landed at Marsala with 1,000 of his famous Redshirts to commence his campaign in Sicily. Pop. (1936) 62,171.

MARSCHALL VON BIEBERSTEIN, mär'shäl fŏn bē'bĕr-shtīn, BARON **Adolf Hermann**, German statesman and diplomat: b. Neuershausen, Baden, Oct. 12, 1842; d. Badenweiler, Sept. 24, 1912. He was the grandson of Baron Karl Wilhelm Marschall von Bieberstein (1763–1817), a Baden diplomat who represented the grand duchy at the Congress of Vienna in 1814. After studying law at Heidelberg and Freiburg he entered the grand duchy's civil service, and from 1875 to 1883 he was a member of the Baden upper chamber; during 1878–1881 he was also member of the imperial diet. In 1890 he transferred to the imperial civil service, succeeding Count Herbert Bismarck as Prussian minister of state. He incurred the bitter hostility of the Agrarians and certain court circles, and was the subject of a police intrigue which he defeated. Political opposition compelled him to resign his office in June 1897, and four months later he was sent to Constantinople as German ambassador to Turkey. There he revealed remarkable ability as a diplomat. He acquired great influence over Sultan Abdul-Hamid II, from whom he obtained the concession for Germany to construct the Baghdad Railway. Representing Germany at the Second International Peace Conference at The Hague, in 1907, he prevented adequate discussion of the subject of restricting armaments. In 1912 he was appointed German ambassador in London, but his health shortly gave way and he died within four months.

MARSDEN, märz'dĕn, **Samuel**, English missionary in Australasia: b. Horsforth, near Leeds, July 28, 1765; d. Windsor, New South Wales, May 12, 1838. After study at Cambridge and ordination in 1793, he went in 1794 as chaplain to the convict settlement at Parramatta, Australia, where his model farm became self-supporting and contributory to the development of local schools and missions. In 1814 he extended his work to New Zealand among the Maoris, who through his efforts became Christianized. He compiled a dictionary and grammar of the Maori language and introduced a settled form of government.

MARSEILLAISE, La, mär-sĕ-lāz', the French national anthem, a revolutionary song, composed by an engineer officer, Claude Joseph Rouget de Lisle, during the night of April 24-25, 1792 in Strasbourg. The song quickly spread. The people of Marseille adopted it to be sung at the meetings of their clubs. It was they who carried it all over France, and hence from them it received its name. De Lisle was a proscribed royalist at the time. His mother wrote to him in alarm, asking, "What is this revolutionary hymn, sung by bands of brigands who are prowling through France and with which our name is linked?" He had originally given it the name of *Le Chant de Guerre pour l'Armée du Rhin* (Battle Song of the Rhine Army). Alphonse M. L. de Prat de Lamartine wrote that de Lisle himself was terrified at the tremendous effect of his composition: "It was the firewater of the Revolution, which instilled into the senses and

soul of the people the intoxication of battle." Thomas Carlyle describes it as "the luckiest musical composition ever promulgated, the sound of which will make the blood tingle in men's veins; and whole armies and assemblages will sing it, with eyes weeping and burning, with hearts defiant of Death, Despot and Devil." On Jan. 8, 1795, the Director ordered the air to be played at all theaters. Its inspiring strains are known throughout the world more than perhaps any other melody. During the Empire and Restoration the Marseillaise was suppressed as a revolutionary demonstration, but was revived with the July Revolution of 1830. The original version consisted of only six couplets; the seventh was added when it was dramatized for the Fête de la Fédération, in order to complete the characters among whom the verses were distributed, namely, an old man, a soldier, a wife, and a child. The stanza commencing with "Nous entrerons" is the one added, intended for the child part. It was written by Dubois, editor of the *Journal de la Littérature*. The complete version follows, with a strict translation.

LA MARSEILLAISE.

1

Allons, enfants de la Patrie,
Le jour de gloire est arrivé;
Contre nous de la tyrannie,
L'étendard sanglant est levé.
Entendez-vous dans ces campagnes
Mugir ces féroces soldats?
Ils viennent jusque dans vos bras
Egorger nos fils, nos compagnes!
Aux armes, citoyens! formez vos bataillons!
Marchons, marchons,
Q'un sang impur abreuve nos sillons!

2

Que veut cette horde d'esclaves,
De traîtres, de rois conjurés?
Pour qui ces ignobles entraves,
Ces fers dès longtemps préparés?
Français, pour nous ah! quel outrage!
Quels transports il doit exciter!
C'est nous qu'on ose méditer
De rendre à l'antique esclavage.
Aux armes, etc.

3

Quoi! ces cohortes étrangères
Feraient la loi dans nos foyers?
Quoi! ces phalanges mercenaires
Terrasseraint nos fiers guerriers?
Grand Dieu! par des mains enchaînées
Nos fronts sous le joug se ploieraient!
De vils despotes deviendraient
Les maîtres de nos destinées.
Aux armes, etc.

4

Tremblez, tyrans, et vous perfides,
L'opprobre de tous les partis,
Tremblez! vos projets parricides
Vont enfin recevoir leur prix!
Tout est soldat pour vous combattre.
S'ils tombent, nos jeunes héros,
La terre en produit de nouveaux
Contre vous tout prêts à se battre!
Aux armes, etc.

5

Français, en guerriers magnanimes,
Portez ou retenez vos coups;
Épargnez ces tristes victimes
A regret s'armant contre nous.
Mais ces despotes sanguinaires,
Mais les complices de Bouillé,
Tous ces tigres qui sans pitié
Dechirent le sein de leurs mères!
Aux armes, etc.

6

Nous entrerons dans la carrière
Quand nos aînés n'y seront plus;
Nous y trouverons leur poussière
Et la trace de leurs vertus!
Bien moins jaloux de leur survivre
Que de partager leur cercueil,
Nous aurons le sublime orgeuil
De les venger ou de les suivre!
Aux armes, etc.

7

Amour sacré de la Patrie,
Conduis, soutiens nos braves vengeurs;
Liberté, Liberté, chérie,
Combats avec tes défenseurs!
Sous nos drapeaux que la Victoire
Accoure à tes mâles accents;
Que tes ennemis expirants
Voient ton triomphe et notre gloire!
Aux armes, etc.

THE MARSEILLAISE.

1

Come, children of the fatherland,
The day of glory now is here;
By tyranny against us
The bloody banner is raised:
Do you hear in the land
Those ferocious soldiers roar?
Up to our arms they come,
Strangling our sons, our women!
To arms, citizens, form your battalions,
Let us march, let us march!
That the foul blood may drench our furrows!

2

What seeks this horde of slaves,
Of traitors and conspiring kings?
For whom these base manacles,
These irons already long prepared?
For us, Frenchmen, ah, such outrage!
What passions it must raise!
'Tis us whom they dare purpose
To restore to former slavery.

3

What! shall these foreign cohorts
Make the law in our homes?
What! shall these hireling phalanxes
Throw our proud warriors down?
Great God! with fettered hands,
Our heads bowed down beneath the yoke!
And despots vile become
The masters of our destinies.

4

Tremble, ye tyrants and traitors,
The shame of every faction,
Tremble! your parricidal projects
Shall at last gain their reward!
Each one is soldier to fight you.
And if our young heroes fall,
The land shall produce them afresh
All ready to struggle against you!

5

Frenchmen, as magnanimous warriors,
Restrain or deal your blows;
Spare those sad victims
Who reluctantly armed against us.
But those bloody despots—
Those accomplices of Bouillé—
All those tigers who pitilessly
Lacerate the bosoms of their mothers!

6

We shall begin our career
When our elders are no more;
Yet we shall find their ashes
And the trace of their virtues!
Less eager to survive them
Than to share their tomb,
It shall be our sublime pride
To avenge or follow them!

7

Sacred love of fatherland,
Guide, sustain our brave avengers;
Liberty, dear Liberty,
Fight with thy defenders!
That victory under our flags
Shall hasten to thy noble call;
And may thy dying enemies
Behold thy triumph and our glory!

MARSEILLE, mär-sā′, or **MARSEILLES,** mär-sālz′, seaport, France, capital of the Bouches-du-Rhône Department, located on the northeast shore of the Gulf of Lions (Golfe du Lion) 98 miles west-southwest of Nice. It is the second largest city and the principal commercial seaport of France, and is an important military and naval station. The city is strongly defended by various works, and lies in the form of an amphitheater round a natural harbor of moderate size (about 70 acres), known as the Old Harbor. From the Old Harbor, one of the finest of the city thoroughfares, called the Cannebière, runs inland in a straight line; while at right angles to this another great thoroughfare traverses the city, planted with trees, lined with fine edifices, and bearing different names at different points. In the older part of the town the streets are narrow and irregular, but in general the streets are spacious and regular and lined with handsome houses. Marseille, however, is not rich in public edifices. The chief are the large cathedral, in the Byzantine style, consecrated in 1893; the church of Notre Dame de la Garde, a modern Romanesque building, on a hill of the same name, whence a splendid view is obtained; the church of Saint Victor, a building of great antiquity; the Hôtel de Ville; the Prefecture; the Palais des Arts de Longchamp, containing a picture gallery and natural history museum; the exchange; the public library (120,000 vols.); the palace of justice or law courts; and the episcopal palace. Marseille is the see of a bishop and possesses a court of first instance, a mint, an Academy of Sciences, Belles-lettres, and Arts, and various learned societies and educational institutions.

Including Old and New Harbors, the total water area is 414 acres; there are seven wet docks, with depths at ordinary tides ranging from 25 to 66 feet, six dry docks, and 13 miles of quayage. A canal irrigates the neighboring slopes and plains, transforming them from arid tracts into fruitful fields. The surrounding districts are now occupied by a considerable population, employed in raising vegetables and fruits on the reclaimed and improved lands. The Marseille-Rhône Canal, intended to open up waterways from Marseille to the interior of France and central Europe, was authorized in 1903, and was completed and opened in 1926. The canal, which is 50 miles long, has no locks and is at sea level throughout its entire course; and with its tributaries it forms a series of waterways 350 miles long, navigable by heavy barges. The most important manufactures are soap, soda, and other chemical products; other products include olive and other oils, sugar, machinery, iron and brass work, matches, candles, glass, earthenware, and cosiery. Shipbuilding is also a major industry.

Marseille was founded by Phocaeans (Ionian Greeks) about 600 years before Christ, the original name of the settlement being Massilia; the Greek language is said to have been spoken here several centuries before Christ. Its progress for centuries was rapid and almost without interruption, and its inhabitants founded several colonies along the Gallic and Spanish coasts of the Mediterranean. The city aided Rome against the Gauls and the Carthaginians but, supporting Pompey, was subjugated by Julius Caesar in 49 B.C. On the decline of the Roman empire it became a prey to the Visigoths, Ostrogoths, and Franks. In 735 it fell into the hands of the Saracens, who completely destroyed all the ancient monuments which the barbarians had spared. It was acquired by the kingdom of Arles in 879, and in the 10th century it became a fief of Provence. In 1218 Marseille secured independence, but it was taken by Charles of Anjou in 1256; in 1481, with the rest of Provence, it was united to the French crown. Certain of the old privileges which it retained were abolished by Louis XIV in 1660. A pestilence in 1720–1721 carried off about half of the inhabitants. In 1793, after a period of revolutionary enthusiasm, came a revolt against the Convention; in 1815 there was a violent reaction against those suspected of Napoleonic sympathies; and disturbances in 1871 led to the prefecture being shelled. The development of the French possessions in North Africa in the 19th century and the opening of the Suez Canal did much to stimulate the growth of the city and port. Pop. (1946) 636,264.

MARSEILLES, city, Illinois, in La Salle County, located on the Illinois River 8 miles east of Ottawa; it is served by the Rock Island Railroad. Industrial products include building and roofing materials, paper cartons, and chemicals. The 400-acre Illini State Park has recreational facilities, and is a noted bird and game refuge. Marseilles adopted the commission form of government in 1912. Pop. (1940) 4,455; (1950) 4,514.

MARSH, George Perkins, American lawyer, diplomat, and philologist: b. Woodstock, Vt., March 15, 1801; d. Vallombrosa, Italy, July 23, 1882. He was graduated at Dartmouth College in 1820, and after admission to the Vermont bar practiced at Burlington. During 1835–1843 he was a member of the Executive Council of Vermont, and for the next six years he was a Whig congressman. From 1849 to 1853 he was United States minister to Turkey; in 1852 he was sent to Greece to investigate the case of Jonas King, an imprisoned American. He was minister to Italy from 1861 until his death. His philological studies were noteworthy.

Among his works were *Lectures on the English Language* (1860); *The Origin and History of the English Language* (1862); and *Mediaeval and Modern Saints and Miracles* (1876). His *Man and Nature, or Physical Geography as Modified by Human Action* (1864) was revised as *The Earth, as Modified by Human Action* (1874). He edited Hensleigh Wedgwood's *Dictionary of English Etymology for American Readers* (1862).

MARSH, Othniel Charles, American paleontologist: b. Lockport, N. Y., Oct. 29, 1831; d. New Haven, Conn., March 18, 1899. After graduating from Yale University in 1860 he spent two more years there in scientific study, then proceeding to Germany for further study in Berlin, Heidelberg, and Breslau. In 1866 Yale established the chair of paleontology for him, and he continued in this professorship until his death. He headed numerous scientific expeditions to the Rocky Mountain region. Among his discoveries are those of the *Odontornithes,* a subclass of Cretaceous birds, with teeth; the *Dinocerata,* ungulate animals of the Eocene period, elephantine in size; the first known American pterodactyls, or flying lizards, and several new families of dinosaurs. Perhaps he was best known for his study of the primitive horse, the *Eohippus, Orohippus,* and *Epihippus.* In 1890–1899 he made

researches in the geology of the region between the Appalachian range and the Atlantic. He was curator of the geological collection of the Yale Museum of Natural History in 1867–99, and in 1898 presented to the university his own collections. He was a nephew of George Peabody (q.v.), and it is said to have been at his suggestion that the Peabody Museum at Yale was established. In 1887 he was made honorary curator of vertebrate palæontology in the United States National Museum, and in 1898 received the Cuvier medal of the French Academy of Sciences. He was president of the American Association for the Advancement of Science in 1878 and of the National Academy of Sciences in 1883–95. From a bibliography of 237 titles these works by him may be cited: 'Odontornithes: A Monograph of the Extinct Toothed Birds of North America' (1880); 'Dinocerata: A Monograph of an Extinct Order of Gigantic Mammals' (1884), and 'The Dinosaurs of North America' (1896). Consult memoir by C. E. Beecher in the *American Journal of Science,* June 1899.

MARSH, Sylvester, American engineer: b. Campton, N. H., 30 Sept. 1803; d. Concord, N. H., 30 Dec. 1884. In 1826 he established a provision business in Boston, in 1833 in Chicago and from 1837 was in the grain trade at Chicago. He originated the meat-packing industry and is regarded as one of the founders of Chicago. From 1864 he resided in New Hampshire. On 25 June 1858, he obtained a charter for a railway to the summit of Mount Washington, a project deemed so impossible that he was called "crazy Marsh." The railway, 2.81 miles long, with an ascent of 3,625 feet, was completed in July 1869. The chief feature in the operation of the road is a central cog-rail. The principle proved so practicable that literally hundreds of similar railways have been constructed on the sides of famous mountains all over the world.

MARSH CROCODILE, or **MUGGER,** the common inland crocodile of India, locally venerated by the Hindus, to whom it is known as "Mugger." It inhabits the tanks and marshes of India and Ceylon, and suitable places westward almost to the Persian coast and eastward throughout the Malay Peninsula and islands. It is dark, olive-brown in general color above, lighter on the ventral surface; the young are paler, with black spots. A specimen 12 feet long is considered large, but instances of a length of 18 feet have been recorded. The head is rough-coated, but has no ridges; the snout is broad and the teeth number 76. These crocodiles swarm in river-marshes, weedy ponds and artificial reservoirs, throughout their range, feeding on fish and small animals, and little feared by horses, cattle or human beings, for in general they are cowardly and reluctant to attack men or even to resist injury. In case the water of their home dries away, they migrate to other pools, and in seasons of drought are likely to be met with anywhere wandering in search of water; as a last resort they will bury themselves in the mud and remain in torpor until revived by the coming of rains. These reptiles display considerable cunning in capturing their food and in avoiding harm, feigning death very cleverly. They are kept in a semi-domesticated condition in many parts of India by pious Hindus, whose priests build temples near the great ponds, protect and feed the reptiles and imagine the service pleasing to the gods as well as profitable to themselves. Extensive descriptions of the animal and of its worship may be found in the zoological works of Blanford, Jerdon, Tennent, Gadow and others and in such volumes as Adams, 'Wanderings of a Naturalist in India' (Edinburgh 1867) and Hornaday, 'Two Years in the Jungle' (New York 1885).

MARSH GAS. See METHANE.

MARSH HARE. See HARES.

MARSH HAWK, or **HARRIER,** a migratory hawk (*Circus cyaneus*) of medium size, commonly known in one or another of its varieties throughout the north temperate zone, which frequents marshy meadows, where it makes its nest upon the ground in a tussock of grass, and lays five to seven roundish, dirty white eggs. In such places it finds its food, chiefly mice and frogs, and sails slowly back and forth close to the ground watching keenly for movements in the grass and ready to pounce upon its prey. Its wings are long and its flight may be swift and powerful when occasion demands, but it was accounted "ignoble" among falconers. It rarely seizes birds or even young poultry, although one of its names is "hen-harrier," and should be protected and encouraged by farmers as one of the most useful and persistent mousers. This hawk may be readily recognized by the broad patch of white on the rump displayed by both sexes. The male is dull grayish-blue, in general tint, and the female rusty brown, both streaked with white. The American harrier (*C. hudsonius*) is generally brown, though the adult males are blue-gray on the back; the tail-coverts are white. Consult Coues, 'Birds of the Northwest' (1874).

MARSH-HEN. See MUD-HEN.

MARSH MALLOW, a coarse, large leaved herb (*Althea officinalis*), of the Old World, but naturalized in marshy places along the eastern coast of the United States, which is related to the hollyhocks (q.v.); the flowers are pale rose-color, some in a terminal spike and some axillary. Its root is mucilaginous and of service as a demulcent in medicine, but it is mainly used as a basis for the confection called "marsh mallow." See MALLOW.

MARSH-MARIGOLD. See COWSLIP.

MARSH-WREN, either of two species of American wrens that inhabit reedy marshes. They have the diminutive brown bodies, short wings and tails, the latter often held cocked up over the back, awl-like bills and inquisitive activity characteristic of wren (q.v.) generally. One is the long-billed (*Cistothorus palustris*), most numerous in the salt-marshes along the Atlantic coast; and the other the short-billed, better known about inland lakes and rivers. The former is somewhat the larger, has a decidedly longer bill and lays eggs dark chocolate in color, while the eggs of the short-billed species are pure white. Both make elaborate nests in the form of ball-like baskets, with a little entrance at the side, woven of leaves of wild rice or marsh grasses and fastened to the stems of the reeds. A curious habit of the species is that each pair will make several nests

each season, only one of which serves the purposes of incubation. These wrens give in the spring an exceedingly pretty clattering song and when dozens are singing together in a patch of reeds the effect is most pleasing.

MARSHAL, a federal officer appointed by the president in each judicial district and corresponding to the sheriff of a county. His duty is to execute all precepts directed to him, issued under the authority of the United States, and is under the jurisdiction of the United States District and Circuit courts. The United States government maintains marshals in its principal dependencies, as the Philippines, Alaska, Puerto Rico, Hawaii, etc. They are appointed by the president for four years, and in addition to serving the courts have certain duties regarding internal revenue, public lands and the postal service. Sometimes the chief of police in American towns is known as marshal. In some European countries the title of marshal confers the highest military distinction, that of marshal of France being especially prized. The word is derived from the Old High German word *marah,* a horse; and *scalh,* a servant; hence *Marascalh,* a man appointed to take care of horses. The marshal of the German Empire derived his origin from the Frankish monarchs and was equivalent to the *comes stabuli* or *connétable.* He was bound to keep order at the coronation of the emperor, and to provide lodgings for the persons connected with the ceremony. He was called *arch-marshal,* a dignity belonging to the electorate of Saxony. At the coronation it was his duty to bring oats in a silver vessel from a heap in the open marketplace, and to present the vessel to the emperor. His duties were discharged by a hereditary marshal (*Erbmarschall*). In Prussia general field marshal is the highest military honor. In England field marshal is given as an honorary rank to general officers who may have no immediate command. Marshal also signifies a person who regulates the ceremonies of certain solemn celebrations or, as in the United States, at parades, street processions, and the like.

MARSHALL, mär'shal, **Alfred,** English economist: b. London, July 26, 1842; d. July 13, 1924. He was educated at Saint John's College, Cambridge, and in 1877 was principal of University College, Bristol. In 1883–84 he was lecturer at Balliol College, Oxford, from 1885–1908 he was professor of political economy at Cambridge, and a member of the Royal Commission on Labor in 1891. He published *Economics of Industry* (1879); *Principles of Economics* (1890); *Elements of Economics* (1891); *Fiscal Policy of International Trade* (1903).

MARSHALL, Frank James, American chess master: b. Brooklyn, N.Y., 1877. He acquired fame when a boy by winning the championship of the famous Brooklyn Chess Club. Next he took the championship of the Manhattan Chess Club. Thereafter he became a professional player and entered in most of the international tournaments. In 1905 he won the International Chess Tourney at Cambridge and challenged Lasker for the world's championship, but was defeated. In all he won first prize in seven international tourneys. He won the Pan-American championship by defeating Capablanca in Cuba in 1912. In the years following he played with varying success. He succeeded Showalter as United States champion.

MARSHALL, George Catlett, American chief of staff, diplomat, and secretary of state: b. Uniontown, Pa., Dec. 31, 1880. Being the son of a Kentucky Democrat in a Republican state, West Point was apparently denied, so he left Uniontown to attend Virginia Military Institute. He stood number 35 in the freshman class and at that early age showed his character by not revealing the identity of the sophomore who bayoneted him during an interclass conflict. He began drill in the awkward squad. He grew in stature and in the favor of his classmates, attaining 15th place in the class and becoming senior officer and first captain. Late in his college career, with high cadet ranking already assured, he decided to go out for football. His play was so brilliant that he was selected all-Southern tackle in 1900. While at V.M.I. he scoured the Civil War battlefields, reconstructing the battle details. Graduating in 1901, he was recommended for and accepted commission as a second lieutenant of infantry. In 1907 he became a first lieutenant and was an honor graduate of the Infantry-Cavalry School. He was graduated from the Army Staff College at Leavenworth in 1908, attaining such phenomenal grades that he was there, as a lieutenant, appointed instructor with captains and majors in his classes, a very unusual procedure at that time.

In 1913 he was a lieutenant in the Philippines. The chief of staff of the "defending" forces fell ill. The lieutenant was called upon. He questioned the regimental commander and ordered an attack, dictating the plan of battle without making a single correction. Maj. Gen. J. Franklin Bell, the army's first chief of staff, in commending the lieutenant for this set of field orders, said that his work put generals to shame and that "he is the greatest military genius since Stonewall Jackson."

He became a captain in 1916 and in 1917, with a Moroccan division in France, won the Croix de Guerre and the Legion of Honor. By 1918 he had become a full colonel. He was selected by General Pershing to be chief of operations of the First American Army under Gen. Hugh Drum. During this assignment, he completed the accredited cleanest piece of staff work of the First World War—the smooth transport without German knowledge of 500,000 men and 2,700 guns from St. Mihiel to the Argonne front in two weeks.

After the armistice, he reverted to captain and spent four years as military aide to General Pershing. He became a major in July 1920, a lieutenant colonel in 1923, a colonel in 1933, a brigadier general in 1936, and a full general as chief of staff on Sept. 1, 1939. He had been assistant chief of staff from July 6, 1938 to Oct. 15, 1938, deputy chief of staff from Oct. 16, 1938 to June 30, 1939, and became acting chief of staff on July 1, 1939. He was the second non-West Pointer to become chief of staff—Leonard Wood was the first. In becoming general in 1939, he was advanced over 34 higher officers —14 brigadier generals, and 20 major generals.

Under General Marshall, the army accomplished the smooth transition from skeleton square divisions and less than 200,000 men in

1939 to streamlined triangular divisions with 8,000,000 men at peak strength during World War II. Promoted to five-star rank, Dec. 15, 1944, the general made his valedictory in his biennial report, published in 1945, which summarized the American military achievement. A month later he relinquished the post of chief of staff.

In December 1945 he flew to China as the president's emissary to mediate between the government of Chiang Kai-shek and the Communists, but his yearlong efforts proved unsuccessful.

The general's appointment as secretary of state, on Jan. 7, 1947, was popularly received, particularly in view of sharpening international tensions. He strongly supported the Truman program of aid to Greece and Turkey, and in his Harvard Commencement address of June 5, 1947, enunciated a program for the rehabilitation of Europe (Marshall plan, q.v.), which was later embodied in the European Recovery Program. He resigned as secretary of state on Jan. 20, 1949, because of poor health, but on Sept. 22, 1949, accepted the presidency of the American Red Cross.

General Marshall was appointed secretary of defense on Sept 12, 1950, special legislation being passed by Congress on September 15 to allow him to take the post. As head of the National Military Establishment, he was responsible for the coordination and direction of the departments of the army, navy, and air force. He resigned Sept. 12, 1951.

MARSHALL, Henry Rutgers, American psychologist and architect: b. New York, July 22, 1852, d. there May 3, 1927. He graduated from Columbia College in 1873 (M. A. 1876) and began to practice architecture in 1878. Ten years later he became interested chiefly in psychology, philosophy and aesthetics. His writings include *Pain, Pleasure and Aesthetics* (1894); *Instinct and Reason* (1898); *The Relations of Aesthetics to Psychology and Philosophy* (1905); *War and the Ideal of Peace* (1915); "The Pacifist at War," *Atlantic Monthly* (May 1918); *Mind and Conduct* (1919); *The Beautiful* (1924).

MARSHALL, Humphrey, American politician: b. Fauquier County, Va., 1760; d. near Frankfort, Ky., July 1, 1841. He joined the Continental Army at the outbreak of the revolution, became captain of Virginia cavalry (1778), in 1780 established himself on a Kentucky plantation, opposed the separation of Kentucky from Virginia, and as a delegate to the Danville Convention of 1787 was prominent in defeating the measure. He was also a delegate to the Virginia Convention that ratified the Constitution of the United States, and in 1793 was a representative from Woodford County in the Kentucky legislature, where he declared his opposition to the plans for raising in Kentucky troops under Gen. George Rogers Clark for an attack on the Spanish settlements near the mouth of the Mississippi River. From Dec. 7, 1795 to March 3, 1801 he was a Federalist senator in the Congress of the United States, and in 1806 was active in denunciation of Aaron Burr. He represented Franklin County in the Kentucky legislature in 1807–1809, and had a dispute with Henry Clay which resulted in a duel in which both received slight wounds. He sat again for Franklin County in 1823. He published the first *History of Kentucky* (1812; rev. ed., 1824).

MARSHALL, Humphry, American botanist: b. West Bradford (the present Marshallton), Pa., Oct. 10, 1722; d. there, Nov. 5, 1801. He began the collection and cultivation of the more interesting indigenous plants, and in 1773 established the Marshallton botanical garden, where were assembled trees and herbaceous plants of the United States. His *Arboretum Americanum* (1785), was translated into several European languages.

MARSHALL, John, chief justice of the United States: b. Germantown (now Midland), Fauquier County, Va., Sept. 24, 1755; d. Philadelphia, July 6, 1835. He was the eldest son of Col. Thomas Marshall of Westmoreland County, Va., a distinguished officer in the French and Indian War and in the War of Independence, and of Mary Keith, a member of the well-known Randolph family. Thomas Marshall removed from Westmoreland County to Fauquier soon after his marriage; this community was sparsely settled, and the educational advantages which he could give his children were meager; consequently he became their earliest teacher and succeeded in imbuing them with his own love of literature and of history. For two years John Marshall had, as tutor, James Thompson of Scotland and he was sent for one year to the academy of the Messrs. Campbell of Westmoreland County, where James Monroe was also a pupil. He had no college training except a few lectures on law and natural philosophy at William and Mary in 1779. He was always fond of field sports and excelled in running, leaping and quoit throwing. He loved the free natural life of the country, and his long tramps through the woods around his father's home, Oak Hill, together with his athletic exercises gave him great strength and agility. At 18 he began the study of law, but soon left his studies to enter the Revolutionary Army. He was active in endeavoring to enlist men for the service and helped to form and drill a company of volunteers. As a member of his father's regiment he took part in the Battle of Great Bridge where he displayed signal valor. In 1776 he became a lieutenant in the 11th Virginia Regiment, and the next year was made captain. He served in Virginia, New Jersey, Pennsylvania and New York, always displaying great courage and valor and a cheerful acceptance of hardships and privations. This experience was of untold value to Marshall: it broadened his views and quickened his insight in governmental questions. As he says, he entered the army a Virginian and left it an American. In 1780, during a period of military inactivity, he attended a course of law lectures at William and Mary and in 1781, after leaving the army, was granted a license and began the practice of law in Fauquier County. The next year he was elected to the Virginia Assembly, and shortly afterward was made a member of the executive council. He served his state as legislator during eight sessions. In 1784, although he had then removed his residence to Richmond, he was again elected delegate from Fauquier County, and in 1787 served as member from the county of Henrico. When the city of Richmond was granted a representative in the legislature, Marshall had the honor of holding this office from 1788 to 1791. He was also a member of the Federal Convention which met in 1788 to discuss the ratification of the Constitution of the United States,

ind it was largely due to his convincing argu-
nents that ratification was carried, as the ques-
ion was hotly debated and the anti-Constitu-
ion party had able and determined representa-
ives. For several years he held no public office
nd devoted himself entirely to his extensive
aw practice, but in 1795 was again elected to
he legislature. During this session he defended
he unpopular "Jay Treaty" with England, and
y his overwhelming arguments completely re-
uted the theory of his opponents that the ex-
cutive has no power to negotiate a commercial
reaty. Marshall's attitude during his service
s legislator toward all questions concerning
ederal power demonstrated his increasing be-
ief that a strong central government is neces-
ary to real efficiency. In 1783 he had married
Mary Ambler, daughter of Jacqueline Ambler,
reasurer of the state, and soon after his mar-
iage made his permanent home in Richmond.
The honors bestowed on him testify to the
steem in which he was held by the state and
y the nation. He refused the attorney-gen-
ralship and the ministry to France, but in
797 accepted the office of special envoy to
France with Charles Cotesworth Pinckney and
Elbridge Gerry. This mission related to the
ndignities which the French had offered the
American Navy and attempted to adjust the
ommercial relations between the two countries.
t failed on account of the arrogant attitude of
France, but "Marshall's dignified correspond-
nce added greatly to the prestige of America,"
nd on his return he was welcomed with many
vidences of approbation from his grateful
ountrymen. Yielding to the earnest solicita-
ion of Washington he became a candidate for
Congress and was elected a member of that
ody in 1798. In Congress he was the leader
f the administration party and the greatest
lebater in the House on all constitutional mat-
ers. In one of his most noted speeches he de-
ended the action of President Adams in the
ase of Jonathan Robbins and proved conclu-
ively that this case was a question of execu-
ive and not of judicial cognizance. In 1800
e was made secretary of state, and in 1801 ap-
ointed chief justice of the United States,
vhich office he held until his death in 1835. In
829 he, like ex-Presidents Madison and James
Monroe, was a member of the Virginia conven-
ion which met to alter the state constitution,
nd by his wisdom and moderation did much
o prevent radical changes and to thwart the
ttempts of politicians against the independence
f the judiciary. In 1831 his health, hitherto
nusually vigorous, began to fail; he underwent
severe surgical operation in Philadelphia and
vas seemingly restored, but the death of his
vife was a great shock and a return of the
lisease in 1835 proved fatal. He died in Phila-
lelphia, whither he had gone for medical relief,
nd was buried by the side of his wife in the
New-Burying-Ground, now Shockhoe Hill Cem-
tery, Richmond. The sorrow over the country
vas deep and widespread; even his bitterest
nemies mourned for the kindly, upright man.

Though somewhat ungainly, Marshall was
lways dignified in appearance; his tall, loosely
ointed figure gave an impression of freedom,
vhile his finely shaped head and strong, pene-
rating eyes bespoke intelligence and power.
Directness and simplicity were his dominant
haracteristics. He was free from any display
of pomp, air of office or studied effect. His un-
failing good humor, his benignity, his respect
for women, his devotion to wife and family and
his well-known reverence for religion made him
loved and admired even by those who heartily
disliked his political opinions. As chief justice
for more than 30 years he rendered numerous
decisions which were of prime importance to a
nation in process of formation. The faculty
which made Marshall invaluable as a jurist was
his power of going directly to the core of any
matter. No subtleties, no outside issue con-
fused him, his analysis was unerring, his logic
incontrovertible; he cared nothing for the
graces of rhetoric and made no appeal to the
emotions; his power lay in his deep conviction
and in his illuminating and progressive argument.
At a period when the powers of the Constitution
were ill-defined, when our government was ex-
perimental, Marshall's decisions in constitutional
and international cases were invaluable factors
in forming a well-organized federal government.
"He made the Constitution live, he imparted to
it the breath of immortality, and its vigorous
life at the present hour is due mainly to the wise
interpretation he gave to its provisions during
his long term of office." Marshall was the author
of numerous reports and papers, of a history
of the colonies and of a *Life of George Wash-
ington,* 5 vols. (1804–07), a book of small lit-
erary merit, but containing a mass of valuable
authentic information. Consult Beveridge, Al-
bert J., *Life of John Marshall,* 4 vols. (New
York 1916-19); Palmer, Bradley W., *Marshall
and Taney, Statesmen of the Law* (New York,
1939).

EMILIE W. MCVEA,
Late President of Sweet Briar College.

MARSHALL, Louis, American lawyer: b.
Syracuse, N.Y., Dec. 14, 1856; d. Sept. 11, 1929.
He was educated in the Syracuse public and high
schools and at the law school of Columbia Uni-
versity. In 1878 he began practice at Syracuse.
He was a member of the firm of Guggenheimer,
Untermeyer and Marshall. He argued many
important causes in the higher courts, specializ-
ing especially in constitutional and corporation
law. Marshall was a member of the New York
Constitutional conventions of 1890, 1894 and
1915; served on the commission appointed by
Mayor Low, in 1902, to investigate East Side
conditions; chairman of the State Immigration
Commission appointed in 1908 by Charles Evans
Hughes (q.v.), then governor, and counsel for
William Sulzer in his impeachment trial. He
was prominent in the movement for the abroga-
tion of the treaty of 1832 with Russia. He was
mediator in settling the cloakmakers' strike in
1910, and prepared the protocol of settlement.
He took an active part in Jewish charitable work
and was president of the American Jewish Relief
Commission during and after the First World
War. Marshall was a trustee of Syracuse Uni-
versity 1910–29.

MARSHALL, Thomas Riley, 28th vice
president of the United States: b. North Man-
chester, Ind., March 14, 1854; d. Washington,
D.C., June 1, 1925. He was graduated from
Wabash College in 1873, studied law and was
admitted to the Indiana bar in 1875, practicing
his profession at Columbia City. In 1908 he was
elected governor of Indiana. His administration

(1909–1913) was progressive. Several laws that he sponsored, including an employers' liability law and a child labor law, were enacted, but he failed in his endeavor to have a new state constitution adopted. At the Democratic National Convention held in Baltimore in 1912, he was the favorite-son candidate of the Indiana delegation for the presidency, and when Woodrow Wilson was nominated for that office, Marshall was chosen for the vice presidency. Renominated and re-elected in 1916, he served with Wilson until 1921. He was a good presiding officer of the Senate and enjoyed much popularity. He became known for his humorous remarks; in 1917, during a Senate debate on the country's needs, he said, "What this country really needs is a good five cent cigar." During President Wilson's absences from Washington and during the president's illness, Marshall often received official visitors. After his term of office expired, he made his home in Indianapolis. He was a member of the United States Coal Commission in 1922. Shortly before his death, he wrote *Recollections of Thos. R. Marshall, Vice-President and Hoosier Philosopher—A Hoosier Salad,* published posthumously in 1925.

Consult Thomas, C. M., *Thomas Riley Marshall, Hoosier Statesman* (Oxford, Ohio, 1939).

MARSHALL, William Louis, United States army engineer: b. Washington, Ky., June 11, 1846; d. Washington, D.C., July 2, 1920. A grandnephew of John Marshall (q.v.), he studied at Kenyon College from 1859 to 1861. He served in the Union Army in 1862–1863, and in the following year was appointed a cadet at the United States Military Academy. Graduating in 1868, he was assigned to the Corps of Engineers as a second lieutenant. He was promoted through the grades, reaching the rank of brigadier general in 1908, on his appointment as chief of engineers. In 1870–1871, Marshall was acting assistant professor of natural and experimental philosophy at West Point, and from 1872 to 1876 he was in charge of the Colorado section of the explorations west of the 100th meridian. He discovered Marshall Pass through the Rocky Mountains in 1873, and the gold placers of Marshall Basin, San Miguel River, in Colorado, in 1875. From 1876 to 1884 he was assistant engineer on river improvement projects in Alabama, Georgia, and Tennessee, and had charge of a section of the Mississippi River. From 1884 to 1899 he was in charge of harbor improvements on Lake Michigan, and he also superintended the construction of the Hennepin Canal (1890–1899). During this period he patented a breakwater and two types of dams. Placed in charge of fortifications and river and harbor works at New York Harbor in 1899, he completed the 40-foot Ambrose Channel and extended Governor's Island. As chief of engineers, he was in charge of river, harbor, and fortification works in the United States from 1908 to 1910, when he retired from active service. Soon thereafter he was appointed consulting engineer to the secretary of the interior, a position he held until his death.

MARSHALL, city, Illinois, seat of Clark County, situated at an altitude of 615 feet, 53 miles south of Danville, on the New York Central and Pennsylvania railroads. In an agricultural and oil-producing region, the city has cheese and paint factories, oil refineries, and rock-crushing plants. Named for Chief Justice John Marshall (q.v.), it was incorporated in 1853. Pop. (1950) 2,960.

MARSHALL, town, Liberia, situated on the Atlantic Ocean, at the mouth of the Farmington River, 30 miles east-southeast of Monrovia. North of the town is Roberts Field, the country's major commercial airport. After the completion of a new deepwater port at Monrovia in 1948, Marshall lost its supremacy as Liberia's chief rubber-shipping port, but it still exports sizable quantities of rubber.

MARSHALL, city, Michigan, seat of Calhoun County, situated on the Kalamazoo River and the New York Central Railroad, at an altitude of 900 feet, 12 miles east-southeast of Battle Creek. The surrounding area raises livestock, grain, and onions. The city's industrial establishments produce automobile parts and trailers, heating and refrigeration equipment, pharmaceuticals, medical supplies, and paint, and process meat and dairy products. Marshall has a public library and a municipal airport. First settled in 1831, it was incorporated as a village in 1836 and as a city in 1859. Government is of the commission type. Pop. (1950) 5,777.

MARSHALL, city, Minnesota, seat of Lyon County, situated at an altitude of 1,170 feet, on the Redwood River and the Great Northern and the Chicago and North Western railroads, 130 miles southwest of Minneapolis. The shipping center of an agricultural area, the city processes dairy products and poultry. It has two public libraries and a municipal airport. First settled in 1871, Marshall was incorporated as a village in 1875 and as a city in 1901. It is governed by a mayor and council, and the water, power, and light systems are publicly owned. Pop. (1950) 5,923.

MARSHALL, city, Missouri, seat of Saline County, situated at an altitude of 780 feet, on the Missouri Pacific and the Gulf, Mobile and Ohio railroads, 30 miles north of Sedalia and 88 miles east-southeast of Kansas City. It is the trading center of a predominantly agricultural region raising corn, wheat, fruit, soybeans, cattle, and sheep. The city has bottling, milling, seed and fertilizer, and milk and poultry processing plants; shoes are the principal factory product. Marshall is the seat of Missouri Valley College (q.v.), of a state school for feebleminded and epileptic persons, and of homes for crippled children and aged women. Settled in 1836, it was named for John Marshall (q.v.) in 1839, and incorporated in 1866. Government is of the council-manager type. The city owns its water and electricity systems and an airport, and operates a highly developed park and recreation program. Pop. (1950) 8,850.

MARSHALL, city, Texas, seat of Harrison County, situated at an altitude of 375 feet, on the Texas and Pacific Railway, 38 miles west of Shreveport, La., and 64 miles south-southwest of Texarkana. The city is the center of a fertile agricultural region producing cotton, vegetables, and dairy products. Although the lumbering operations of earlier days have been reduced as reserves of timber have declined, second-growth pine is used in sawmilling. The presence nearby of oil and natural gas, lignite, clay, and glass sands has stimulated the city's industrial develop-

henr. Marshall has railroad shops, a car wheel nd foundry plant, cotton compresses, food- rocessing plants, clothing factories, potteries, and rick and tile yards. The city is the seat of t. Mary's Academy, a coeducational Roman atholic institution; East Texas Baptist College, ounded in 1912 as the College of Marshall; and wo coeducational colleges for Negroes: Wiley ollege, a Methodist institution founded in 1873, nd Bishop College, a Baptist institution founded n 1881. Marshall is in a resort section; 15 miles o the northeast are Caddo Lake, from which the ity draws its water supply, and Caddo State ark. The city has a public library, three high chools, and a municipal airport. Government is f the city manager type.

First settled in 1841, Marshall was incorpo- ated as a town in 1843 and as a city in 1848. t was named for Chief Justice John Marshall q.v.). During the Civil War it was the seat of he Confederate state government of Missouri. s headquarters of the ordnance, quartermaster, nd commissary departments, it played an im- ortant role in the administration of the Con- ederacy. Large stores of military supplies were ept in Marshall, and the trans-Mississippi agency f the Confederate postal service had its head- uarters in the city. Pop. (1950) 22,327.

MARSHALL COLLEGE, a coeducational nstitution located at Huntington, W. Va. It was ounded in 1837 and opened the following year. ames E. Morrow, father of United States Sena- or Dwight Whitney Morrow (q.v.), was presi- ent of the college at the time of his son's birth. n 1947–48 the college reported an enrollment of 008 students—2,179 men and 829 women—a aculty of 157 members exclusive of administra- ve officers, a summer school enrollment of 1,072 udents, and an income for the year of $564,603. he grounds, buildings and equipment of the ollege were valued at $3,997,000. The library ontained 40,939 volumes.

MARSHALL ISLANDS, an archipelago in he western Pacific Ocean, north of the Equator. he islands are situated eastward of the Caro- nes and northward of the Gilbert Islands, and e between 5° and 12° N. lat. and 165° and 171° . long. They were annexed in 1885–86 by ermany, and after the First World War became mandate of the League of Nations; the mandate as assigned to Japan, whose activities on the rchipelago remained largely veiled. The group onsists of two parallel chains, about 700 miles n length, the Radak ("Sunrise") group of 18 lands in the east and the Ralik ("Sunset") roup of 14 islands in the west, the chains being pproximately 100 miles apart. The aggregate rea of the islands is 160 square miles, and the opulation was reported to number 10,446 in 1935. abur, a small town on Jaluit (38 miles long by l miles in breadth), an island of the Ralik group, the administrative headquarters; Majuro, of he Radak group, is the most populous island, ormally containing 1,600 inhabitants. Coconuts, ugar, and cotton are cultivated; breadfruit trees, andanus, and taro also grow, as well as bananas nd yams. The natives, who are Micronesians, re skillful in weaving mats and in the construc- on of large canoes.

In 1942–43 the islands enjoyed virtual im- unity from American attacks, but on Jan. 31, 944, United States forces struck at Kwajalein Lae, and Namu atolls of the Ralik group, and within less than a week had completed their cap- ture. In the same group, to the north and north- west, Eniwetok was captured on Feb. 18, Wotho on March 12, and Ujelang on April 25, 1944. No attempt was made to seize other of the Marshall Islands, though the Japanese garrisons on them were frequently bombed. It was estimated in February 1945 that by-passed Japanese troops on Wotje, Maloelap, and Mili, of the Radak group, and on Jaluit, totaled 12,000 to 14,000 men. Na- tives of Majuro, Arne and Aur atolls in June petitioned the United States "to be our guardian and protector" after the war should end. The bypassed garrison surrendered late in August.

MARSHALL PLAN or **EUROPEAN RE- COVERY PROGRAM (ERP).** In an address made at the commencement exercises of Harvard University on June 5, 1947, Secretary of State George C. Marshall called on the European na- tions whose economies had been shattered by the effects of World War II to unite in planning their economic rehabilitation. He stated that American aid would be forthcoming if a number of European countries should agree on a joint program of reconstruction, and he promised that this assistance would be substantial and would extend over a period of three or four years. But the initiative for a program designed to place Europe on its feet economically, he observed, should come from Europe, while the role of the United States should consist of friendly aid in drafting a European program and then of sup- porting it to the best of its practical ability. He continued:

> "It is logical that the U.S.A. should do whatever it is able to do to assist in the return of normal economic health in the world, without which there can be no political stability and no assured peace. Our policy is directed not against any country or doctrine but against hunger, poverty, desperation and chaos. U.S. assistance should not be doled out as crises develop. Any assistance this Government may render in future should provide a cure rather than a palliative. Any Government willing to assist it in the task of recovery will find full co-operation on the part of the U.S. Government. Any Government which maneuvers to block the recovery of other countries cannot expect help from us. Furthermore, Governments, political parties, or groups which seek to perpetuate human misery in order to profit therefrom politically or otherwise will encounter the opposition of the United States."

While the last two quoted sentences were ob- viously intended as a warning to the Kremlin, Mr. Marshall at a press conference on June 12 emphasized that the term "Europe" as he had employed it throughout his address signified "everything west of Asia," including Great Brit- ain and the Soviet Union. Two days later in London it was announced that Foreign Minister Ernest Bevin would in a few days visit France to discuss with Prime Minister Paul Ramadier and Foreign Minister Georges Bidault "the new American approach to Europe." Synchronously it was announced in Paris that the French gov- ernment had asked the Soviet government whether it was prepared to exchange views on the Ameri- can proposals. As disclosed by the head of the economic department of the Quai d'Orsay on June 16, French suggestions previously made to Mr. Marshall were, that those countries wishing to avail themselves of the American offer should organize working committees to draw up a bal- ance-sheet of Europe's resources in the vital fields of iron and steel, coal, transport and agriculture, the United States having representation on each committee, also Germany through the occupying

powers. A joint communiqué issued by the British and French foreign ministers in Paris on June 18 welcomed Mr. Marshall's pronouncement and stated that their governments considered comprehensive programs should be drawn up by all participating European countries in liaison with the appropriate United Nations organization, also that an invitation would be sent to Foreign Minister V. M. Molotov of the USSR for a joint meeting of the foreign ministers of the three chief European powers "in order to discuss these proposals as a whole." Meanwhile, on June 13 the secretary general of the United Nations had issued a statement that the U.N. was prepared to support the American plan.

Between June 27 and July 2 the three-power conference of foreign ministers held five sessions in Paris. Molotov strongly opposed drafting a broad program of international aid as preliminary to receiving American assistance. It would infringe on the national sovereignty of smaller states, he argued. "The plan of Britain and France," he declared, "would lead to their separating themselves and those associated with them from the other states in Europe," and he warned of grave, though unspecified, consequences that would result. Bevin rejected Molotov's arguments as "based on a complete travesty of the facts," and in response to the covert threats he remarked, "My country has faced grave consequences and threats before, but it is not the sort of prospect which will deter us from doing what we consider our duty." Bidault's reply contained a counter-warning to the Soviet Union against dividing Europe into two groups.

Russia having definitely refused to cooperate, Bevin and Bidault on July 3 issued a joint statement declaring that their governments had "decided to invite all European States (with the temporary exception of Spain) who desire to participate in framing a reply to Mr. Marshall's suggestion to collaborate with them in setting up this organization, whose task will be to draw up a program of European reconstruction in which the resources and needs of each country will be coordinated in such manner as each freely decides."

Fourteen countries accepted the Franco-British invitation to a European economic conference, as follows: Austria, Belgium, Denmark, Eire, Greece, Iceland, Italy, Luxembourg, The Netherlands, Norway, Portugal, Sweden, Switzerland, and Turkey. A fifteenth, Czechoslovakia, formally accepted on July 8, but two days later withdrew its acceptance, actuated, it was generally believed, by fear of Russian reprisals. Other eastern European countries dominated by Russia which declined were: Poland, Yugoslavia, Bulgaria, Hungary, Rumania, Finland and Albania.

Meeting in Paris with Bevin as chairman from July 12 to 15 the conference of 16 nations appointed a 16-member Committee of Cooperation (later called the Committee of European Economic Cooperation, or CEEC). Reports gathered during July and August for the executive committee indicated that the total dollar deficit for a 4-year period should be estimated at $28,000,000,000, with annual deficits expected to continue after 1951. At a conference on August 30, United States Department of State representatives criticized the preliminary findings. On September 22 the final CEEC report was issued in two volumes. The estimate for the 4-year dollar deficit of the 16 countries and Western Germany was scaled down to $19,330,000,000, and there were detailed plans for European reconstruction involving restored or increased production in all branches of the economy. Plans for achieving financial and fiscal stability were outlined, and proposals were made for the promotion of freer trade among the cooperating nations.

It was now the turn of the United States to take responsive action. President Truman on October 23 summoned the United States Congress to convene on November 17 and the next day, in a radio broadcast to the nation, called for both immediate and long-term aid to Europe, including $357,000,000 of interim aid for France and $285,000,000 for Italy, also some provision for Austria. On November 8 his committee on foreign aid estimated Europe's 4-year dollar deficit at between $17,000,000,000 and $23,000,000,000, and recommended year-to-year appropriations totaling between $12,000,000,000 and $17,000,000,000. Two days later, Secretary Marshall addressing the Senate Foreign Relations Committee estimated Europe's needs for the future period of April 1, 1948 to June 30, 1949 at $7,500,000,000. To provide interim aid until March 31, 1948 he asked $328,000,000 for France, $227,000,000 for Italy, and $42,000,000 for Austria. The president's message to Congress on November 17 supported the secretary of state's request for a total of $597,000,000 of interim aid; on December 15 a combined bill was passed by the Senate granting the full amount, and was signed by the president two days later. However, in the appropriations bill passed by both houses on December 19 the total was reduced to $540,000,000, of which $18,000,000 was earmarked for China, and the balance for France, Italy and Austria.

President Truman's second message to Congress, of December 19, described the long-range program to assist European recovery. His recommended program called for a total amount of $17,000,000,000 to be allocated to the 16 countries and western Germany during the period 1948–1951 in annual instalments. The first would be for the period April 1, 1948 to June 30, 1949, and would require an appropriation of $6,800,000,000. In his next message of Jan. 7, 1948, he reiterated these recommendations.

A Senate committee recommended in February that the first major appropriation be made for a 12-month period, from April 1, 1948 to Mar. 31, 1949, rather than for the proposed 15-month period, and that the amount in aid be set at $5,300,000,000 for this shorter span. On March 14 the Senate approved the bill, thus amended, by a vote of 65 to 17.

Meanwhile, the House Committee on Foreign Affairs proposed to combine the European Recovery Program (ERP) with programs to aid China ($570,000,000 had been requested by President Truman on February 18 to bolster China's sagging economy) and also Greece and Turkey (Secretary Marshall on February 26 requested $275,000,000 for continuing military aid to the latter countries). Accordingly, on March 31, by a vote of 329 to 74 the House passed a bill to provide $6,205,000,000, of which $5,300,000,000 was alloted for the first year of the European program. (On June 20 the total was cut to $6,030,710,228.) The House also voted to include Spain in the program over strong administration protests, also protests from the European participants. On April 3 a compromise bill omitted Spain from the program and set the total for the first 12 months at $5,300,000,000 (reduced on June 20 to $4,875,-

000,000). On April 4 the Economic Cooperation Act of 1948 was signed by the president. Though approved in principle, the program required congressional appropriations to become effective. On April 5 the president directed the Reconstruction Finance Corporation to advance $1,105,000,000 to initiate the program.

Creation of the Economic Cooperation Administration (ECA) was followed on April 6 by the appointment of Paul G. Hoffman, a leading industrialist, as administrator. On May 11, W. Averell Harriman was appointed ambassador to head the ECA missions in Europe with headquarters in Paris. These missions were required to negotiate economic cooperation agreements with each of the participating governments. By mid-July all agreements had been signed with the exception of that with Switzerland which, not desiring any direct aid from the United States, declined to sign an agreement.

The second conference of the 16 states opened in Paris on Mar. 15, 1948 and appointed a committee to make plans for a permanent Organization for European Economic Cooperation (OEEC). In a report of March 17 stress was laid on recent gains in European production, but the shrinkage of dollar supply and imports from dollar countries was also noted. On the same day the 5-power 50-year pact of mutual defense was signed at Brussels by plenipotentiaries of Belgium, Britain, France, Luxembourg and The Netherlands.

At the fourth meeting of the OEEC, July 8-11, the council agreed to allocate the United States dollar aid among its members and to the Anglo-United States zone of Trieste. In subsequent meetings further fruitful understandings were reached. On September 11 a committee of five experts of the OEEC made the allocation of the total of $4,875,000,000 to the various countries. The largest single allotment of $1,263,000,000 went to the United Kingdom and the next largest, $989,000,000, went to France. Italy received $601,000,000; Bizonia (British and U.S. zones in Germany), $414,000,000; The Netherlands, $412,000,000; and other countries received lesser amounts.

The ECA act provided that part of the assistance to Europe should be in the form of loans. By October 6, 1948, ECA loans had been concluded with 11 countries for a total amount of $817,300,000 with payment of interest (at 2½ per cent) and repayment of principal beginning after July 1, 1952.

Wherever Communist parties were entrenched in the labor movement, as in England, France and Italy, they used every means of propaganda, strikes and sabotage to disrupt national economies and frustrate the objectives of the OEEC and the ECA, particularly during the spring and summer of 1948. But it was not until early 1949 that the Soviet government shifted from a negative position of mere violent denunciation of the Marshall Plan and fifth-column efforts to destroy it to an affirmative policy of setting up a rival organization for eastern Europe. On Jan. 25, 1949, Moscow announced the formation of a 6-nation Council for Economic Mutual Assistance (CEMA). This "Molotov Plan" bound the satellite states of Bulgaria, Czechoslovakia, Hungary, Poland and Rumania to the USSR by closer trade ties. Yugoslavia was not a member of CEMA, for Marshal Tito's nationalist heresy was already causing concern to the Cominform.

On Aug. 31, 1949, the OEEC approved a schedule of allotment of ERP shares for the second year aid (1949–1950), based on the expectation that the U.S. Congress would make $3,776,500,000 available, and that to this amount could be added $150,000,000 which the ECA had set aside as a reserve fund for trade and colonial projects. The largest shares, in millions of dollars, were: $962.0 for the United Kingdom; $704.0 for France; $407.0 for Italy; $348 for West Germany (Trizonia); $312.5 for Belgium-Luxembourg; and $309.2 for The Netherlands (including Indonesia). The accompanying report to the ECA stated that Europe's slump in exports to the United States during 1949 had wiped out all progress toward balancing the ERP recipients' trade. It warned that there was no prospect of Europe becoming self-sufficient by 1952 with annual reductions of ERP payments, and urged the United States to reconsider Marshall Plan fundamentals "at a very early date."

What would be the effects on Europe's economic rehabilitation resulting from the devaluation of the British pound (from $4.03 to $2.80) on Sept. 18, 1949, and similar devaluations in 24 other countries, including France, the Low Countries, Scandinavia, Canada, and India, within the next four days, was still in the realm of conjecture at the close of the year.

DRAKE DE KAY,
Editorial Staff, "Encyclopedia Americana."

MARSHALLTOWN, Iowa, city and Marshall County seat; alt. 863 feet; on the Chicago and North Western; Chicago Great Western; Minneapolis and St. Louis railroads, 58m. NE. of Des Moines. The Iowa River borders the city. Marshalltown is located in the heart of a great hog-and-hominy section, and meat packing is a leading industry. Minneapolis and St. Louis Railroad shops are here, and there are foundries. Gaskets for automobiles, furnaces, and heating specialties are among the manufactured products. Pop. (1950) 19,821.

MARSHALSEA, mär'shal-sē, a prison in London, attached to the Marshalsea Court, originally established under the earl-marshal of England for the trial of servants of the royal household. Later it was used as a prison for debtors and defaulters, as well as persons convicted of piracy on the high seas. It stood near the church of Saint George, Southwark, and existed in the reign of Edward III. It was abolished in 1849. The Marshalsea will be longest remembered as the home of "Little Dorrit." Charles Dickens' father was for some time an inmate of the Marshalsea, and in *Little Dorrit* the novelist gave a vivid picture of the life of a debtor and his family in this prison.

MARSHBUNKER or **MARSBUNKER.** See MOSS-BUNKER.

MARSHFIELD, märsh'fēld, town, Massachusetts, in Plymouth County, at an altitude of 24 feet, 15 miles east of Brockton, on a state highway. It is a summer resort town, and has cranberry bogs. Daniel Webster lived here during the latter part of his life, and is buried here in the Winslow Cemetery. The township includes the resort villages of Humarock, Ocean Bluff, Sea View, and Green Harbor. The town was settled in 1632, incorporated in 1642. Pop. (1950) 3,267.

MARSHFIELD, Wis., city in Wood County; alt. 1,288 feet; 185m. NW. of Wilwaukee; on the Soo Line; and the Chicago and North Western Railroad. In the northern dairy belt, the city is a shipping point for milk products, including butter, cheese, and casein. Local industries center upon the manufacture of veneer panels and doors, shoes, steel tanks, culverts, vaults, springs and mattresses, beer, agricultural instruments, and apiary supplies. Originally settled in 1868, by 1887 it had become a large sawmill community, with furniture factory, hub and stave factories, and boiler works. In that year, fire destroyed most of the town; and with the rebuilding, its industrial interests gradually shifted from lumbering to dairying and cheese-making. Incorporated as a town in 1875, Marshfield became a city in 1883. Government: mayor and council. Pop. (1940) 10,359; (1950) 12,394.

MARSHMAN, Joshua, English Baptist missionary and Orientalist: b. Westbury, Leigh, Wiltshire, April 20, 1768; d. Serampore, India, Dec. 5, 1837. He was, like his father, a weaver, but had an insatiable thirst for learning and always kept a book on his loom. Thus he fitted himself to teach in a Baptist school in Bristol; and thence, in 1799, he went to Serampore as a Baptist missionary, and there founded, in 1810, a missionary college. He was an able linguist, and published *The Works of Confucius, containing the Original Text* (1809); *Clavis Sinica* (1814); a Chinese version of the Bible. He cooperated with Carey in the preparation of Telegu version of the Bible, a Bengali-English dictionary and a Sanskrit grammar. Consult Carey, *Marshman and Ward* (1864).

MARSILEACEAE, a natural order of acotyledonous plants, nearly allied to Lycopodiaceae, but differing in the lack of a stem, and in the usually stalked leaves. The species all are inhabitants of ditches and pools, chiefly in temperate regions. No species was known to be of any importance till the discovery of the Nardoo of Australia.

MARS-LA-TOUR, France, village in the department of Meurthe-et-Moselle, 15 miles west-southwest of Metz, on the road to Verdun. In the Franco-Prussian War of 1870–1871 it was the scene of part of the battle of Gravelotte. The 38th German brigade was annihilated here.

MARSTON, John, English poet and dramatist: b. 1575?; d. London, 1634. His comedies include *The Malcontent, The Dutch Courtezan,* and *Eastward Ho,* the last written with Ben Jonson and Chapman. His *Sophonisba* and *The Insatiate Countess* were tragedies.

MARSTON MOOR, England, in Yorkshire, is celebrated for the defeat there in 1644 of the royal forces numbering about 18,000 under Prince Rupert by the Parliamentary troops and Scots, totaling about 27,000 under Fairfax (Earl of Manchester) and Cromwell. Rupert escaped with only 6,000 followers into Lancashire and later rejoined King Charles. As a result, the whole north of England was left to the Parliamentary troops. Consult Kennedy, J. W., *Scottish Borderers at Marston Moor,* 1644 (1902).

MARSUPIAL FROG, any of several small tree frogs (*Hylidae*) of the South American genus *Nototrema,* which incubate their eggs in brood-pouches formed by infoldings of the skin on the back of the female. The eggs are few, of large size and abundantly provided with food-yolk, and the young sometimes remain in the pouches after hatching until they have completed their metamorphosis and attained considerable growth; but the species vary in this respect. See also Tree Frog.

MARSUPIAL MOLE, a small burrowing marsupial of southern Australia (*Notoryctes typhlops*), called "urquamata" by the natives, which has a remarkable similarity to a true mole in appearance (except its reddish color). It represents a family (*Notoryctidae*) first described by Stirling in the *Transactions* of the Royal Society of South Australia for 1891.

MARSUPIALIA, the marsupial mammals, a group ranked as an order, yet embracing the whole of the superior group *Metatheria* or *Didelphia,* as it has been variously named. The latest investigations, however, tend to invalidate the distinctions upon which these groups were formerly sharply separated from the higher mammals and to cause the marsupials to be regarded only as an order of *Eutheria* (q.v.), now distinguished chiefly by their extremely local distribution and degenerate non-placental type of reproduction. Their origin was extremely ancient and its sources are not known; but the group appears to have risen to Mesozoic times among the earliest of mammalian forms and to have begun, even before the advent of the Tertiary period, a course of special modification and degeneration, especially in the line which has survived to the present. The former belief that the marsupials stood in the direct line of ancestry of mammals generally, which were thus considered as modified and diversified offshoots from the stock, is no longer held; on the contrary, the marsupials are regarded as a branch from some very early generalized stock, if not a group of independent origin. It is noteworthy, according to Woodward (*Vertebrate Palaeontology,* 1898), that the earliest known complete mammalian skeletons, which pass upward by insensible gradations into undoubted *Eutheria,* are scarcely distinguishable from the skeletons of the more generalized existing marsupials (for example, *Thylacinus*). In the later Mesozoic Age the marsupials were apparently scattered over all the land area of that time, as their remains have been discovered in many parts of both hemispheres; but even previous to the Eocene epoch they had disappeared entirely from north of the equator. From the first they are divisible into the two branches or suborders of *Polyprotodontia* and *Diprotodontia.* The former, characterized by numerous small incisor teeth, includes a majority of the most ancient forms and such modern groups as the opossums and desyures; while the latter, characterized by only about six upper incisors and two, much enlarged, lower incisors, contain, besides some ancient forms, the majority of modern representations of the order, as the kangaroos, phalangers, wombats, etc.

The marsupials take their name from the ventral pouch of skin, covering the mammary glands, in which the young are nourished or

protected in most families, and which is indicative of the peculiar method of reproduction characteristic of the order, and for the support of which two bones (the epipubic bones), not present in higher mammals, project forward from the pelvis. The internal organs of reproduction are double, the two oviducts not uniting into a single uterus or vagina, although the separation of the two parts is often imperfect; hence the term *Didelphia* (q.v.). The testes of the male are suspended in a scrotum in front of the penis, the *glans* of which is often double. As a rule no allantoic placenta is present, but there is reason to suppose that the primitive marsupials were placental, and rudiments of this structure persist in the existing Australian bandicoots—a fact which invalidates the former prime distinction made between the marsupials and higher *Eutheria.*

The young are dropped from the mother's womb as minute, undeveloped foetuses, those of the largest kangaroos being not half as large as mice when born. These larvae (for they are that) are then taken by the lips of the mother and placed, one by one, within her ventral pouch, where each is attached to one of her teats, where it clings by means of its temporary sucking-mouth and is nourished by the milk which oozes or is passed down its throat. They remain there a length of time varying with the size of the species, until they have grown to an advanced stage of development, when they gradually emerge; but for a long time afterward return to the mother's pouch for refreshment, rest or safety when alarmed. The pouch varies in its capacity and completeness, in some families being quite absent, so that the young are shielded only by the long hair upon the mother's belly.

While this strange method of reproduction is the most prominent peculiarity of the marsupials, they differ from other orders of mammals in several anatomical features, such as the simplicity of the brain, in which the cerebellum is completely exposed, and the tendency to separation of bones of the skeleton, usually solidly anchylosed in other mammals.

Since early Tertiary times marsupials have been confined to South America and the Australasian region, with the single exception of the few North American opossum (q.v.). This family (Didelphyidae) is restricted to the western hemisphere and alone remains of the large number of Tertiary forms once prevalent in South America, save a single Patagonian diprotodont, the opossum-rat (q.v.). The home of the group, then, is Australia, Tasmania and the Papuan group, where about 125 species are known; and the race seems to have survived in that insular region owing to the absence of destructive enemies, for most of them are almost defenseless vegetable feeders. They have, however, developed into a great variety of forms under the influence of varying conditions and long competitions, and present a most curious parallel to the diversities observable among the higher and more widely diffused mammalia. Some have large size, go in herds and occupy grassy plains; others are smaller, more agile and confined to mountainous districts. Others are still smaller, burrow and feed upon roots or resemble little terrestrial rodents in appearance and habits; while many forms dwell altogether in trees and often simulate squirrels of various kinds. In another direction have been evolved a variety of predatory marsupials, whose needs have developed bodies, teeth and powers resembling those of wolves or bears, and which are wholly flesh eaters. There is, in fact, hardly a group of mammals which does not find a counterpart among the marsupials—even the moles and shrews.

The classification of the order divides it into 10 or 12 well-defined families, some of which are wholly extinct, as follows:

POLYPROTODONTIA:

Doubtful primitive forms.—*Triconodon,* Amphitherium, etc.

Didelphyidae.—Opossum (q.v.).

Dasyuridae.—Dasyures, Thylacines, etc. (qq.v.).

Peramelidae.—Bandicoots (q.v.).

Notoryctidae.—Marsupial mole (q.v.).

DIPROTODONTIA:

Epanorthidae; Abderitidae, etc.—Fossil in the Miocene strata of Patagonia; but surviving in *Caenolestes.*

Phalangeridae.—Phalangers (q.v.).

Diprotodontidae.—Extinct gigantic phalangers.

Phascolomyidae.—Wombats (q.v.).

Macropodidae.—Kangaroos (q.v.).

Consult Beddard, Frank Evers, *Mammalia* (London 1902); Gould, J., *Mammals of Australia* (London 1863); and scientific works on Australia, especially those of George Robert Waterhouse and Richard Lydekker.

MARSUPPINI, mär-sŭ-pi'ni, **Carlo** (sometimes called CARLO ARETINO), Italian humanist and scholar: b. Genoa, 1398; d. Florence, April 24, 1453. Originally from Arezzo, his family moved from Genoa to Florence where Marsuppini lived the greater part of his life. There he became the teacher of Lorenzo de' Medici and Giovanni di Cosimo and was noted for his public lectures and recitations. In 1444 he was appointed chancellor of the republic.

Among the literary remains of Marsuppini are letters, epigrams, elegies, and translations of the farced epic *Batracomyomachia* (1429), and portions of the *Iliad* into Latin hexameters.

MARSYAS, mär'sĭ-ăs, in Greek mythology, the son of Hyagnis and one of the Sileni of Asia Minor. Athena, having seen the reflection of herself in water, had thrown away the flute which she had invented, displeased because it disfigured the countenance in playing, and had pronounced the severest maledictions against any one who should take it up. Marsyas accidentally found this instrument, on which he soon acquired such skill that he dared to challenge Apollo to a contest, the conditions of which were that the victor should do what he pleased with the vanquished. The Muses, or according to some the Nysaeans, were invited to be the judges and decided in favor of Apollo, who put to death his rash competitor by binding him to a tree and flaying him alive. In this way was the curse of Athena accomplished.

Marsyas' statue was erected in several Roman cities as a symbol of liberty and other statues have been found illustrating his experiences, one by Praxiteles, which has been preserved in the Athens Museum.

MARTA OF THE LOWLANDS (Terra baixa), the foremost achievement of the Catalan theater, was written in Catalan by Angel Guimerá for Fernando Díaz de Mendoza and

María Guerrero and performed for the first time by these actors in the Spanish translation by José Echegaray. It is the first Catalan work to obtain general currency beyond the limit of the provincial tongue. During the present century no play has been more popular in the Spanish or Hispano-American countries, where it has maintained itself upon the stage without interruption since 1896, enlisting the talents of all the leading actors. 'Terra baixa' is predominantly social and human in appeal. This is its fundamental quality; but in equal degree it possesses high theatric effectiveness, which is not inferior to the best work of its period in this vein, whether produced in Spain or elsewhere. Simple feeling and torrential passion, in conjunction with sensitive insight and unusual grasp of significant situation, convey an impression of elemental forces operating behind the broad effects of a carefully elaborated theatrical art, happily employed strictly in subservience to the theme. More than any other play, 'Terra baixa' has contributed to fix the general conception of Iberian peasant drama which prevails in Europe and America. A certain idealization may be noted in the rural characters, a reminiscence of the author's apprenticeship in the poetic drama. In objective realistic detail Guimerá is an unequivocal master. 'Terra baixa' has been translated into more than 20 languages. The English version by Wallace Gillpatrick (New York 1914) was acted successfully in England and the United States previous to publication. As 'Tiefland,' the play is favorably known in operatic form, with music by Eugène d'Albert.

JOHN GARRETT UNDERHILL.

MARTEL, Charles. See CHARLES MARTEL.

MARTEL DE JANVILLE, Gabrielle, COMTESSE DE ("Gyp"), French author: b. Coëtsal, Morbihan, 1850. She is a great grandniece of Mirabeau and at the age of 19 was married to Comte Martel de Janville. Her writings deal with types of Parisian life, of which Petit Bob, Loulou and Paulette have become famous. Over 135 volumes in all have issued from her pen. These include 'Petit Bob' (1882); 'Autour du mariage' (1883); 'Un homme délicat' (1884); 'Elle et lui' (1885); 'Autour du divorce' (1886); 'Pour ne pas l'être?' (1887); 'Pauvres petites femmes' (1888); 'Bob au salon' (1888); 'Mademoiselle Eve' (1889); 'Bob à l'Exposition' (1889); 'L'Education d'un prince' (1890); 'Monsieur Fred' (1891); 'Mariage civil' (1892); 'Du haut en bas' (1893); 'Mariage de chiffon' (1894); 'Le cœur d'Ariane' (1895); 'Le bonheur de Ginette' (1896); 'Totote' (1897); 'Israël' (1898); 'L'Entrevue' (1899); 'Le pays des champs' (1900); 'Le friquet' (1901); 'Sœurette' (1902; 2d ed., 1910); 'Un ménage dernier cri' (1903); 'Maman' (1904; 2d ed., 1910); 'Le cœur de Pierrette' (1905); 'Ces bons Normands' (1907); 'La paix des champs' (1908); 'Joies d'amour' (1909); 'L'Amoureux de Line' (1910); 'La guingette' (1911); 'Le grand coup' (1912); 'Napoléonnette' (21st ed., 1913).

MARTELLO TOWERS, so called by corruption from *Mortella,* in Corsica, where a strong tower maintained a determined resistance to a superior English force in 1794. In consequence of the great strength exhibited by this fort the British government erected a number of similar towers round the coast of Great Britain, and especially on the Kentish coast, as a defense against the threatened invasion from France. They are circular, with walls of great thickness, and roofs bomb-proof, there are two stories, the lower for the reception of stores and the upper for the casement of troops. One traversing gun was mounted upon each, in working which the men were secured by the lofty parapet. The ordinary guard was from 6 to 12 men. With improved modern artillery Martello towers are useless, and in many places were dismantled, but some have received a new and more powerful armament, or have been adapted to the use of the coast guard, or revenue officers. In some instances they are rented to private individuals. Martello towers are still to be found in New Brunswick and Nova Scotia. There are also several on the Gulf of Mexico and one still remains at Kingston, Canada.

MARTEN, the name of several fur-bearing animals of the weasel family (*Mustelidæ*) that are mainly arboreal in habits, and do not change their color to white in winter. All inhabit the cooler parts of the Northern Hemisphere. The beech or stone marten (*Mustela foina*) is to be found in Europe generally south of the Baltic, although not now a native of Britain. It is about 17 inches long in body, and its tail adds nine inches; its breast is white. It is tractable, and is believed by some to be the animal domesticated by the ancient Greeks as a mouser. The pine, or sweet, marten (*M. martes*) is rather smaller, but with a much longer tail, proportionally, and is more northerly in its distribution, occurring from the British Isles and Norway eastward to Siberia. It has a finer, more valuable fur than the other, and a yellow throat. Very nearly allied to it in size, form and color is the Siberian sable-marten (*M. zibellina*), noted as furnishing in its coat the finest and most expensive of the furs from animals of this group. The demand for this fur can be met only by the most difficult, and often dangerous, exertion in trapping and hunting in remote Asiatic forests; and it has resulted in a steady diminution of the supply and very high prices for the pelts. There is also a native marten in India and another in Japan. North America has two species of the genus — the American pine-marten, or Canadian sable (*M. americana*), and the pekan (*M. pennanti*). The former is hardly distinguishable from the sable of the Old World, and its fur, although regarded as somewhat inferior, is largely used as a substitute for genuine Siberian sable. (See FUR-TRADE). The pekan is very distinct by its greater size (length, 24 inches, plus tail, 13 inches), its long and very dark coat and its dog-like head. Its fur is of great value.

The body in all these martens is elongated and supple, with a long and somewhat bushy tail; the legs short and the toes separate and flexible, with long sharp claws adapted to the life in trees that most of them follow. They are fierce and cunning hunters, pouncing successfully on all sorts of small animals and birds, destroying birds' nets, catching frogs, and in winter pursuing and killing animals as large as hares and porcupines. The pekan, or fisher, is especially bold and voracious, but does not eat fishes in spite of its name. Both the

American species were formerly common in the mountainous parts of the eastern United States, but are now restricted to the remoter woods of Canada. They make their dens, bedded with leaves and grass, in some high hollow of a tree-trunk, as a rule, but frequently choose a crevice among rocks, and there produce annually a litter of from one to seven young. The period of gestation is about three months, and the young begin to leave the nest when two months old.

Breeding for Fur.—These bloodthirsty little carnivores are the very type of savagery, and even the kittens are almost untamable. The high value of their fur (in 1948 the average marten pelt brought $27.56 on the Canadian market; in 1949, $15.76) has caused much effort to be expended, especially in Canada, to breed them in confinement, but thus far the results have been small, although encouraging. The general treatment and food seem to be like that for minks. A large pen made of inch-mesh wire and floored with this, or in some way so prepared that the animal cannot dig out, should contain stumps and bushes to give the marten accustomed exercise. Two males cannot be put together. When the female is ready for a mate she is placed in his cage, or vice versa, and the mating will take place at night, so that the pair must usually be left together several days. Mating occurs naturally in January or February. When the young are about two months old they may be removed from the mother, and should be brought up by hand, if possible, so as to become more gentle. These general directions apply to the pekan, but his quarters should be larger than for the sable.

G., *Fur Farming; the Weasel Family* (Oshawa, Ont., 1925); Innis, H. A., *The Fur Trade in Canada* (New Haven, Conn., 1930); Harding, A. R., *Fur Farming* (Columbus, Ohio, 1936).

MARTENSITE, mär'tĕnz-īt, a constituent of steel, existing at a high temperature, and which being retained by sudden cooling confers hardness upon the steel.

MARTHA'S VINEYARD, mär'thăz vĭn'-yĕrd, an island, Massachusetts, off the southwest coast of Cape Cod, constituting, with the Elizabeth Islands, the county of Dukes. It is separated from the mainland by Buzzard's Bay, the Elizabeth Islands, and Vineyard Sound. New Bedford, with which it has steamship connections, is 20 miles distant; Boston, 80 miles by water. The island is 20 miles long and 10 miles across at its widest part. The largest towns on the island are Tisbury (including the village of Vineyard Haven), Oak Bluffs, and Edgartown, the county seat. The northern coast is high and rocky, rising to 308 feet. The southern coast is low and irregular, with sand bars and inlets. At Gay Head is one of the island's several lighthouses and a Coast Guard station. The island, once the headquarters of a whaling fleet, is a popular summer resort. A large part of the interior has been set aside as a state park.

It was discovered and named by Bartholomew Gosnold in 1602, and was a part of the original New York grant until 1692. The Indians who then occupied the place were quiet and friendly and professed conversion to Christianity. They remained loyal to the whites even during King Philip's War. Pop. of Dukes County (1950) 5,633.

MARTI, mär-tē', **José Julian,** Cuban author and patriot: b. Havana, Jan. 28, 1853; d. Dos Ríos, Cuba, May 19, 1895. He studied in Havana, was sent to the quarries in 1869 while only a boy as a political suspect, then was exiled to Spain, where in Madrid and Saragossa he studied for the bar and made himself famous for his liberal views, and on his return to America was professor in the University of Guatemala, whence he came to New York City in 1890 as consul for Uruguay, Paraguay, and Argentina. In 1894 he attempted to land armed men in Cuba, but was intercepted in Florida; in the next year he succeeded in landing, joined Gen. Maximo Gómez y Báez and was killed in a skirmish with the Spanish at Dos Ríos. A poet who supported himself mainly by journalism, he is regarded as one of the greatest Spanish-American prose writers. His *Ismaelillo* (1882) is considered by some critics as foreshadowing the modernist movement in Spanish letters.

MARTIAL, mär'shăl (MARCUS VALERIUS MARTIALIS), the world's greatest early writer of epigrammatic poetry, was born in Bilbilis, Spain, March 1 of one of the years 38 to 41 A.D., and died probably between 102 and 104 A.D. Like his literary friends, the Senecas, Lucan, and Quintilian, who also were of Spanish birth, Martial in his writings was thoroughly Roman, and indeed has left us our most valuable picture of contemporary Rome. A Fronto and Flacilla, whom he mentions, may have been his parents, but we know nothing of their origin or station. The grammatical and rhetorical training which his parents secured for him perhaps at Tarraco (Tarragona) or Corduba (Córdoba), he half-seriously disparaged as being of no financial advantage, but it was really to his pen that he owed, at least indirectly, his support through life. For, although he was apparently fully equipped for practice at the bar, the profession of an advocate was too exacting to be attractive. On his arrival in Rome in 64 A.D., powerful friends launched him on a literary career which rapidly carried his fame even to the limits of the empire. But success as a poet brought him no contentment, since in return for the money, food, and clothing, which by flattery and begging he got from imperial courtiers and other men and women of wealth, he had daily to perform social duties that were highly irksome to his indolent nature. From the patron's reception at dawn to the end of the latest dinner, he had to dance attendance with wit that should never fail.

We find him living at first in humble lodgings on the Quirinal, later in a house of his own on the same hill. A barren farm near Nomentum was his usual refuge from the cares and noises of the capital, but he sometimes made long journeys in Italy, often visiting the country houses of his friends. To his poetical and social talents he also owed political favors from Titus and Domitian. A tribuneship gave him membership in the equestrian order, but probably not the fortune of a knight. He likewise received the coveted privileges to which a father of three children was entitled, the *ius trium liberorum*, though unearned; for the references that have given rise to the theories that he was married from one to three times are not of personal application. It is probable that even Marcella was no more than his patroness. When disgust at the client's life in Rome led him in 98 to return to Bilbilis, this Spanish lady gave him a fine estate. A longing soon seized

him, however, to be back in Rome with all its inspirations, a longing never to be gratified; Pliny the Younger, who had helped Martial with a gift of money on his departure from Rome, records the poet's death in Spain. Besides those already named, Juvenal and Silius Italicus should be mentioned as Martial's friends. Noteworthy among contemporaries whose names do not appear in his poems are Tacitus and Statius. The former could have had little sympathy with his character, the latter was no doubt his rival in literary mendicancy. We have 1,575 of Martial's poems. More than half of these are of four lines or less. His earliest book published in 80 contains epigrams describing shows given by the emperor. Then followed books XIII and XIV made up of two-line inscriptions for presents at the Saturnalia. The other books (I–XII), containing many poems which we should not call epigrams at all, appeared at varying intervals in the period 85–101. Martial's influence in his chosen field has never ceased. A remarkable number of the best epigrams in modern languages are merely adaptations or translations of his poems. His personal character has received general condemnation. Obscenity and servile flattery are the main charges. But in judging even the insincere language that he uses in speaking of the tyrant Domitian we must remember that it went only a step beyond the requirements of formal court etiquette. Kindly critics find in Martial some good points, his modest valuation of his own work, his freedom from envy, his scorn of all hypocrisy, his steady resistance to all temptations to use his powerful weapon of satire in either an unjust or unkind spirit, his tender love of children, humane treatment of slaves and above all his deeply affectionate attachment to his friends. See EPIGRAM.

Bibliography.— The best text edition of his poems is that of W. M. Lindsay, Oxford, Clarendon Press. The German annotated edition of Friedlaender is invaluable. The only complete translation in English, is in the Bohn series.

WALTON BROOKS MCDANIEL,
Professor of Latin, University of Pennsylvania.

MARTIAL LAW, government by arbitrary military power; that supersedes municipal law, or State law, yet is not a military law. When in time of extreme peril to the State, either from without or from within, the general safety cannot be trusted to the ordinary administration, or the public welfare demands the adoption and execution of extraordinary measures, it may become necessary to declare the existence of martial law. This is, indeed, no law at all in its ordinary sense; it is in fact the abrogation of it. That which is done under martial law has not an immediate constitutional or legislative sanction, as the military or the statute law, for example, has. Yet remotely and indirectly martial law expresses the will of the people. The Supreme Court of the United States has held that a State legislature may proclaim its existence whenever the public safety demands it; and the Constitution, by implication at least, also permits its proclamation by that clause which provides that the privileges of the writ of *habeas corpus* shall not be suspended, unless when, in cases of rebellion or invasion, their suspension is essential to the general welfare. See also LAW, MILITARY; MILITARY COURTS AND COURT-MARTIAL.

MARTIAL'S EPIGRAMS. Marcus Valerius Martialis, the epigrammatist, was born about 40 A.D. in Bilbilis, Spain, 20 miles west of the present Aragonese city of Saragossa. He went to Rome at the age of 23, and after nearly two score years of residence at the capital returned to his native town, where he died about 104. At the age of 40 he celebrated the dedication of the Coliseum and won the favor of the Emperor Titus by composing the 'Book of Spectacles,' a collection of epigrams on the incidents of the day's sport. Several years later he published two collections of couplets to be used with dinner favors and with presents at the Saturnalia, which afterward took their places in his works as books XIII and XIV. Books I to XII, his really characteristic work, were published at intervals more or less regular from 86 to 102, the last one having been sent from Spain after his return. The total number of pieces in the 15 books is about 1,550, of which three-fourths are in the elegiac couplet, like the verse of Ovid and the great part of Greek epigram.

Though at first glance Martial seems to continue the tradition of the epigram, which had already had long life and great fame in the Greek tongue, he is really to a large extent original and creative, and is of the greatest importance in literary history as being the founder of the epigram as it has been popularly conceived ever since; that is, as a short, highly concentrated poem with a point that is made to appear suddenly or with a surprise.

> "Chloë weeps with one eye. Do you ask how it's done?
> The answer is easy: she has only one."
> (Dimsdale.)

Whether his influence has been the best is sometimes questioned. Those who are familiar with the calm, sunny, contemplative, tripping genius of the Greek Anthology, which, though its epigrams are always neat and concise, and sometimes stinging, has not as a whole the satiric character, will be likely to think Martial somewhat hard and metallic in both form and content. Those who enjoy «verbal exactness and mechanical ingenuity» (Dimsdale), and look to the epigram for the character of stinging, satiric pointedness usually associated with it, will agree with Lessing that he is the world's greatest epigrammatist, and understand his appeal to Dryden, Pope and Johnson.

Martial is not all pungency. A not inconsiderable number of his pieces are epigrammatic rather than epigrams; a few of them might be classed as short poems without reference to epigram. They are nevertheless homogeneous. Even more than perfection of form, the characteristic that gives them all a unity, is their quality as a human document. Martial was right when he said, «My page smacks of human life.» Provincially and simply bred, pursuing the existence of a free lance in a great capital in an intense age, gifted with a keen understanding, a quick eye, and a responsive pen, he converted into clear, cameo-like literary pictures for the amusement of his own time, and for the amusement and instruction of all time, innumerable vivid impressions from the fascinating realities among which he moved. To read his epigrams in quantity is like sitting before a cinematograph of the Flavian era. There flash before us lively scenes

of men and things: numerous faces of the known and the nameless, types of men and women from every sphere, the bawling schoolmaster with his noisy pupils, the poetical bore reciting his verses to unwilling ears, the stingy host, the snowstorm in the amphitheatre, the routine of the Roman day, the patron who is never at home, the guest who comes too early, the transparent hypocrite, the slow barber, the waste slopes of recently active Vesuvius, the incident of the circus or theatre or the dinner or the street. In an age of *ennui*, the world is fresh and interesting to Martial. Not only men, but things, find him attentive. Thinking of this and of his facility of expression, Verrall says ('Literary Essays, Classical and Modern,' p. 15) that he is "perhaps the only writer in whom plate and tapestry, earthenware and hardware, beds and sofas, become truly poetic." Dimsdale ('Latin Lit.,' p. 472), commenting on his method of attaining vividness by the use of realistic detail, says that "he uses no general expressions such as rich and poor, but speaks in terms of jewelry, scents, linen, cloaks and boots."

Martial is a satirist, but only by accident. He has no moral indignation such as a few years afterward glows from the page of Juvenal. "A certain intolerance of hypocrisy," says Mackail ('Latin Lit.,' p 194), is the nearest approach Martial ever makes to moral feeling. He does not scold; he does not even preach. He manifests no moral enthusiasms, and almost no malice for anything. He is a wit rather than a humorist, though he is by no means without humor. He merely records, and his quality as a satirist is the outgrowth and accompaniment of epigrammatic expression rather than the result of conscious purpose. To portray freely and realistically was in itself to satirize.

The reader's enjoyment of Martial unexpurgated is interfered with by coarseness in about one in 10 of his pieces. This is hardly higher or lower than the modern European average, though his coarseness is not on this account the more welcome. He is also charged with servility in his attitude toward the emperor and other patrons. It should be said in extenuation that literary patronage has until not long ago been a regular and a recognized relation and has always carried with it a certain amount of purely conventional flattery, and that Martial's servility perhaps did not seem so offensive in his own day as it does now, when the servility of the literary art finds expression in other ways. So clean-hearted and clean-lipped a man as the younger Pliny, in expressing regret at the poet's death, has left the word *candor* as descriptive of him: "he was a man of talent, penetrating, keen, with exceeding wit and satire as a writer, and with no less candor." This is probably a reference to the sincerity and frank straightforwardness of Martial the realist, who saw clearly and took no pains to cover up either other men's failings or his own. Of himself he says, "My page is free, my life upright." Of his work he says:

> "Good, fair, and bad
> May here be had.
> That's no surprise!
> Twere vain to look
> For any book
> That's otherwise."
> (Kirby Smith.)

Lovers of Spanish art in general, and of the present day novel in particular, will find themselves wondering whether Martial is not to be explained as merely an ancient example of the truthfulness and directness which so strongly characterize the Spanish genius. Paul Nixon, in "A Roman Wit," gives a spirited rendering, inevitably lacking in finish, of about 200 epigrams. The Bohn Library Martial contains a greater number of translations in both verse and prose. Kirby Smith, in the *Sewanee Review*, Vol. 26, No. 1, may be consulted for appreciation.

GRANT SHOWERMAN.

MARTIN, Saint, of Tours: b. about 316; d. about 400. He attended the catechetical school at Pavia. His father was a military tribune, and compelled him in his 16th year to take up arms. He is said to have early escaped from his father and received instruction in a Christian church. He served under Constantius and Julian, and went to Gaul, where he appeared as the model of all virtue. Among other acts he divided his cloak with a poor man whom he met at the gates of Amiens (Ambianum). The legend says that Christ appeared to him in the following night covered with the half of this cloak. Soon after this vision Martin was baptized, in 337. After living many years in retirement he made a visit to his native place, during which he converted his mother, and opposed with zeal the Arians who prevailed in Illyria. For this he was scourged from the country, on which occasion he manifested the firmness of a martyr. He now established a monastery in Milan, but when he found himself again exposed to persecution took refuge on the island of Gallinaria, in the Ligurian Sea. He next settled at Poitiers, where he assembled a number of monks, and is said to have wrought many miracles. In the year 375 (according to others 371 or 374) the bishopric of Tours was conferred on him against his will. In order to withdraw himself from the world he built the famous convent of Marmontiers, between the river Loire and a steep rock. This is regarded as the oldest abbey of France.

MARTIN, the name of five popes of the Catholic Church, as follows:

MARTIN I, Saint: b. Todi, Tuscany; d. Chersan, Crimea, 16 Sept. 655. He was elected Pope in 649, succeeding Theodore I. He summoned the first Lateran Council at which he caused the doctrine of two wills and operations in Christ to be affirmed. The Emperor Constans II upholding the doctrine which the Council had condemned, took the Pope prisoner and brought him to Constantinople on a charge of treason and then banished him to the Crimea. On account of his sufferings he is numbered among the saints. His day is 12 November.

MARTIN II, or MARINUS I: b. Montefiascone; d. Rome, 14 Feb. 884. He was elected Pope in 882 after the death of John VIII. While bishop of Caere he had been legate for three popes in their negotiations with the East. To English King Alfred he sent a piece of the wood of the cross.

MARTIN III, or MARINUS II: b. Rome; d. 946. He succeeded Stephen VII in 942 and was greatly esteemed for his learning and nobility of character.

MARTIN IV (Simon de Brion, sē-môn dė brē-ôn): b. France; d. Perugia, 28 March 1285. He succeeded Nicholas III in 1281, having previously been canon of Tours, and cardinal from 1262. He owed his election in great measure to the influence of Charles of Anjou, whom he supported thereafter and did all in his power to enable that monarch to retain possession of Sicily. In his pontificate occurred the massacre known as "The Sicilian Vespers."

MARTIN V (Oddone Colonna, ŏt-tō'nā kō-lōn'nä): b. Rome, 1368; d. there, 20 Feb. 1431. He was elected Pope in 1417, after the abdication of Gregory XII, and the deposition of John XXIII and Benedict XIII, during the Council of Constance. His first act was to promulgate a bull against the Hussites, remarkable from the circumstance that in it the Pope seems to recognize the supreme authority of the councils. He was one of the ablest of the popes, and through his efforts unity was finally secured to the Church and peace to Italy. In 1418 he dissolved the Council of Constance, though a number of difficulties were not then adjusted, and dissensions continued in the Church. Benedict XIII still lived; and at his death, in 1424, a new anti-pope was elected in Clement VIII, who renounced his pretensions in 1429, when he received the bishopric of Minorca as an indemnification.

MARTIN, Alexander Carson, American missionary and educator: b. Livonia, Ind., 10 April 1827; d. Peking, China, 18 Dec. 1916. He was educated at the University of Indiana, from which he was graduated in 1846. He later studied at the New Albany Theological Seminary (now the McCormick Theological Seminary), at Chicago, from which he was graduated in 1847. The New York University conferred the degrees of D.D. and LL.D. upon him.

He was appointed a Presbyterian missionary to China in 1849 and left here on 23 November of that year for Canton. For 67 years he worked among the Chinese. It was said of him that probably he knew China and the Chinese language as did no other American. Dr. Martin retired from active missionary work in 1868 to enter the Chinese government service. He was named by the Board of Foreign Missions here as an honorary missionary. He acted as interpreter for the United States Minister to China in the negotiations between the Washington government and the Imperial Government, at Peking, in connection with the United States-Chinese treaty of 1853. He was the organizer and president of the International Law and Language School in Peking which was destroyed in the Boxer rebellion in 1900. He was said to have been the first Western teacher to open the door of English learning to the youth of the Far East. After 30 years as adviser to the Chinese government, Dr. Martin became president of the new Imperial University of China. This movement for the establishment of a great institution of learning there was blighted by the Boxer uprising. Later Dr. Martin took the leadership of the Wu Chany University for a period of three years. He retired from this work in 1905. In the same year, when he was 78 years old, he gave up teaching, but remained in the capacity of adviser for both the government and the Presbyterian mission.

MARTIN, Bradley, American banker, brother of Frederick Townsend Martin: b. Albany, N. Y., 1841; d. 1913. In 1863 he was graduated at Union University, Schenectady, N. Y. He served in the National Guard during the Civil War, attaining the rank of lieutenant. Subsequently he was admitted to the bar. He managed his vast interests in banks, trust companies and the industries, and was one of the most prominent figures in the social life of the East. In 1893 he went abroad and thereafter lived in England and Scotland.

MARTIN, Charles Cyril, American civil engineer: b. Springfield, Pa., 30 Aug. 1831; d. Far Rockaway, N. Y., 11 July 1903. He was educated at Rensselaer Polytechnic, Troy. He was engineer in the Brooklyn navy yard during the Civil War; and afterward chief engineer of Prospect Park, Brooklyn; and was appointed John A. Roebling's second assistant in building the Brooklyn Bridge, of which he became chief engineer after Roebling's retirement.

MARTIN, Edward Sandford, American author: b. Owasco, N. Y., 2 Jan. 1856; d. New York City, 13 June 1939. He was graduated from Harvard, 1877; was a founder of *The Lampoon,* and for many years was an editor of *Life.* He also wrote for *Harper's Magazine.* His published works include 'Sly Ballades in Harvard China'; (1882); 'A Little Brother of the Rich,' verses (1890); 'Pirated Poems' (1890); 'Windfalls of Observation' (1893); 'Cousin Anthony and I' (1895); 'Lucid Intervals' (1900); 'Poems and Verses' (1902); 'The Luxury of Children, and other Luxuries' (1904); 'The Courtship of a Careful Man' (1905); 'In a New Century' (1908); 'Reflections of a Beginning Husband' (1913); 'The Diary of a Nation' (1917); 'Abroad with Jane' (1918); 'What's Ahead and Meanwhile' (1927).

MARTIN, Félix, French-Canadian clergyman and author: b. Auray, Brittany, 1804; d. 1886. He emigrated to Canada in 1842, having previously entered the Society of Jesus. His task in Canada was to aid in re-establishing Jesuit missions. Saint Mary's College, Montreal, was founded by him. Père Martin made diligent search in French and Canadian archives seeking out information regarding the early Jesuit missionaries in Canada. His principal works are 'Manuel du pèlerin de Notre Dame de Bon Secours' (1848); 'Relation des Jesuites,' an enlarged edition of O'Callaghan (1850); 'Mission du Canada, relations inédites' (1861); 'De Montcalm en Canada' (1867); 'Le reverend Père Isaac Jogues' (1873).

MARTIN, François Xavier, American jurist: b. Marseilles, France, 17 March 1764; d. New Orleans, 11 Dec. 1846. He emigrated to Martinique when 18; later removed to New Berne, N. C.; taught French there, and became a printer; studied law, being admitted to the bar about 1789; and in 1792 was requested by the State legislature to compile the British statutes in force before the Revolution. He was himself a member of the assembly in 1806-07; was judge of the Mississippi Territory in 1809; went to Louisiana in the same capacity in 1810; and in 1813 became attorney-general of the new State of Louisiana. From 1815 until just before his death Martin was a member of the Supreme Court of the State. Although blind for the last 10 of these 31 years, his ability was

not impaired, and it is due to him that the law of the State was in some measure evolved from the tangle of French and Spanish statutes in which he found it. He wrote a 'History of North Carolina' (1829); 'History of Louisiana' (1827); and a version of Pothier on Obligations.

MARTIN, Frederick Townsend, American author, brother of Bradley Martin: b. Albany, N. Y., 1849; d. London, 1914. In 1872 he was graduated at the Albany Law School. He became a member of the New York National Guard, in which he was commissioned colonel and served a period as judge-advocate. For many years previous to his death he had lived in Europe. He was prominent in charitable enterprises and a lavish benefactor of the poor. His writings deal with the doings of the wealthy and the so-called social-elect, of which class Martin was well qualified to speak. His works include 'The Passing of the Idle Rich' (1911); 'My Personal Experiences of Meeting Snobs' (1911); 'Reminiscences of My Life' (1911); 'Things I Remember' (1913).

MARTIN, George Madden (Mrs. Attwood R. Martin), American author: b. Louisville, Ky., 3 May 1866. She was educated in the public schools of Louisville, finishing at home on account of her health. In 1892 she was married to Attwood R. Martin. She became a frequent contributor of short stories to magazines and periodicals and is author of 'Emmy Lou—Her Book and Heart' (1902); 'The House of Fulfilment' (1907); 'Abbie Ann' (1907); 'Letitia—Nursery Corps, U.S.A.' (1907); 'Selina' (1914); 'Emmy Lou's Road to Grace' (1916); 'Warwickshire Lad' (1916); 'Children of the Mist' (1920); 'March On' (1921).

MARTIN, Gregory, English translator of the Bible: b. Maxfield, Sussex, date unknown; d. Rheims, France, 28 Oct. 1582. Martin received his education at Saint John's College, Oxford, where he took the degree of B.A. in 1561 and that of M.A. in 1565. He was very well versed in Hebrew, Greek and Latin and was made tutor to Philip Howard. Martin opposed the Established Church; remained a staunch Roman Catholic and exerted a powerful influence on the Howards to remain true to the ancient faith. In 1570 his continued opposition to the new ecclesiastical order of things in England obliged him to seek refuge at Douai, Flanders, where he became professor of Hebrew in the newly-founded English College. He went to Rome in 1577 to aid in founding the English College there. In 1578 Martin went to Rheims, to which city the English College was moved from Douai, and there spent his remaining years in writing the production of the English version known as the Douai Bible. It is the official Bible for English Catholics, was made from the Vulgate of Saint Jerome and collated with the Greek and Hebrew versions. In 1582 the New Testament was issued but not until 1609–10 did the Old Testament appear. English Protestants criticized Martin's version, yet the commission of Forty-Seven made extensive use of it in preparing the Authorized Version in the reign of James I.

MARTIN, Helen Faucit, Lady. See Faucit, Helen.

MARTIN, Helen Reimensnyder, American author; b. Lancaster, Pa., 18 Oct. 1868; d. New Canaan, Conn., 29 June 1939. She was educated at Swarthmore and Radcliffe colleges, and in 1899 married Frederic T. Martin. She was especially noted for her depiction of Pennsylvania Dutch life, which she portrayed in numerous short stories contributed to magazines. All told she published 30 books, the last one, 'Emmy Untamed' in 1937. Other books include 'Tillie, A Mennonite Maid' (1904); 'Sabina, a Story of the Amish' (1905); 'The Betrothal of Elypholate' (1907); 'Revolt of Anne Royle' (1908); 'The Crossways' (1910); 'When Half-Gods Go' (1911); 'The Fighting Doctor' (1912); 'The Parasite' (1913); 'Barnabetta' (1914); 'For a Mess of Pottage' (1915); 'Challenged' (1925); 'Ye That Judge' (1926); 'Sylvia of the Minute' (1927).

MARTIN, Henry Austin, American surgeon: b. London, 23 July 1824; d. Boston, 7 Dec. 1884. He came to the United States at an early age and was graduated from the medical school at Harvard in 1845, when he established a practice in Boston. He served as a surgeon until nearly the close of the Civil War, when he resigned and was brevetted lieutenant-colonel for gallant service. He devoted his attention principally to surgery and to the treatment of smallpox, upon which subject he was a generally recognized authority. He was the originator of many important innovations in the field of surgery and published valuable professional articles in periodicals.

MARTIN, Henry Newell, American biologist: b. Newry, Ireland, 1848; d. 1896. He received his education at University College, London, and at Christ's College, Cambridge, He was appointed to the chair of biology at Johns Hopkins University in 1876 and was also made director of the biological laboratory. Dr. Martin carried out important experiments on respiration. He was chosen president of the American Society of Naturalists in 1890. He published 'The Human Body' (1881); 'Observations in Regard to the Supposed Suction-Pump Action of the Mammalian Heart' (1887). Professor Martin assisted Huxley in the latter's 'Practical Biology' (1876) and edited 'Studies from the Biological Laboratory of Johns Hopkins' and the *Journal of Physiology.*

MARTIN, Homer Dodge, American painter: b. Albany, N. Y., 28 Oct. 1836; d. Saint Paul, Minn., 12 Feb. 1897. He was elected a member of the National Academy of Design in 1875; and resided in France in 1882–86. While he was influenced somewhat by the Barbizon School of painters, he developed a style entirely his own, which placed him among the best known of American landscape painters. His works include 'Landscape on the Seine'; 'An Equinoctial Day'; 'Brook in the Woods'; 'In the Adirondacks'; 'Sand Dunes on Lake Ontario'; and 'White Mountains, from Randolph Hill.' Consult for reproductions Carroll, D. H., 'Fifty-Eight Paintings by Homer D. Martin' (1913).

MARTIN, Joseph, Canadian statesman: b. Milton, Ontario, 24 Sept. 1852; d. 2 March 1923. He was educated in Canadian and Michigan public schools and at the University of Toronto. He was admitted to the bar in 1882 and from 1882–92

was a member of the Manitoba legislature. From 1888 to 1891 he was attorney-general and minister of education of Manitoba. In the latter capacity he introduced the bill abolishing the separate school system in Manitoba and thus precipitated a memorable crisis in Manitoba and Dominion politics. Martin failed of election to the House of Commons in 1891, but sat for Winnipeg in 1893–96. He removed to British Columbia in 1897 and in the following year became a member of the legislature of that province, sitting until 1903. In 1898–99 he was provincial attorney-general and minister of education and in 1900 was premier of British Columbia. In 1907 Martin was owner and editor of the Vancouver *Guardian*. In 1908 he removed to England, contested Southwest Warwickshire in the Liberal interest in 1909. In Canada he took an active part against the Canadian Pacific Railway monopoly, in the abolition of French as official language and advocated the introduction of the Torrens system of land registry. He was a strong freetrader and advocate of reciprocity between the United States and Canada.

MARTIN, Josiah, English colonial governor in America: b. probably in Antigua, West Indies, 23 April 1737; d. London, England, July 1786. He rose to the rank of lieutenant-colonel in the British army in 1771, and in the same year was appointed to the royal governorship of North Carolina. He was successful in pacifying the "regulators," many of whom remained zealous Tories; and took a firm and energetic attitude in the maintenance of British authority. But on 24 April 1775 he was compelled to escape to the sloop *Cruiser*, from which on 8 August he issued a prodigiously long proclamation which the Whigs ordered burnt by the hangman. He was with Sir Peter Parker at Charleston (June 1776), and accompanied Cornwallis into North Carolina after the British victory over Gates at Camden; but in March 1781 withdrew to Long Island, and thence went to England.

MARTIN, Luther, American lawyer: b. New Brunswick, N. J., 9 Feb. 1748; d. New York, 10 July 1826. He was graduated from the College of New Jersey (Princeton) in 1766; studied law at Queenstown, Md.; was admitted to the Maryland bar in 1771; in 1774 was one of the commissioners appointed to oppose the claims of Great Britain; in 1778 became attorney-general of Maryland; and in 1787 was a delegate from Maryland to the convention that framed the Constitution of the United States. His opposition to the instrument was so strong that, rather than sign it, he left the convention, thus earning from Jefferson the sobriquet of "the Federal bull-dog." In 1804 he defended Samuel Chase (q.v.) in the latter's impeachment trial before the Senate, and in 1805 resigned his attorney-generalship and resumed private practice. He was counsel for Burr in Burr's trial at Richmond in 1807, in 1814–16 was chief judge of the Baltimore Court of Oyer and Terminer, and in 1818–20 was again attorney-general of Maryland. Among his writings was the series of pamphlets, 'Modern Gratitude' (1801–02). Consult Goddard, 'Luther Martin' (1887).

MARTIN, Percy F., English author and journalist: b. 30 March 1861. He received his education at University College, London, served as correspondent in Mexico of the *Times*, the *Tribune* and the Glasgow *Herald;* and in India of the *Times* (Engineering Supplement) and the *Evening Standard*. He also served as special correspondent of the *Financial Times* and *The Engineer* in Central and South America and as contributor to the *Times Trade Supplement*. He has published 'Through Five Republics of South America' (1905); 'Mexico's Treasure House' (1906); 'Mexico of the Twentieth Century' (1907); 'Salvador of the Twentieth Century' (1911); 'Peru of the Twentieth Century' (1911); 'Greece of the Twentieth Century' (1912); 'Maximilian in Mexico' (1913); 'The Sudan in Evolution' (1916); 'Egypt, Old and New' (1923). He is a contributor to periodicals and magazines.

MARTIN, Sir Theodore, English lawyer and author: b. Edinburgh, 16 Sept. 1816; d. 16 Sept. 1906. He was educated at the University of Edinburgh and became a solicitor in Edinburgh in 1840. In 1846 he became a parliamentary solicitor in London, carried on an important and extensive business and varied professional cares with literary work. With Aytoun he published the once famous 'Bon Gaultier's Ballads' (1845). He married in 1851 Helen Faucit, the celebrated actress. His translations comprise many of the works of Goethe, Schiller, Horace, Catullus, etc., and he has written 'Essays on the Drama'; 'Madonna Pia' (1855); 'Life of Lord Lyndhurst' (1884); 'Life of the Prince Consort' (1875–80); 'Helena Faucit, Lady Martin' (1900). He was created K.C.B. in 1881.

MARTIN, Thomas Commerford, American electrical engineer and author: b. London, England, 22 July 1856; d. 17 May 1924. He was educated in an academy at Gravesend, England, by a private tutor and subsequently studied divinity. He was associated with Thomas A. Edison in laboratory work and electrical development in 1877–79 after which he engaged in editorial work. From 1883 to 1909 he was editor of the *Electrical World* and after 1909 he was advisory secretary of the National Electric Light Association. In 1900–15 Mr. Martin was engaged as special expert of the Census office of the United States. He lectured at the Royal Institution of Engineers, La Société Internationale des Electriciens, Paris, the University of Nebraska, Columbia and Lehigh universities, Delaware College and for the New York Board of Education. He was a member of the conference committee organized by engineering societies to expend the $1,500,000 given by Andrew Carnegie for a united engineering building and the Engineers' Club of New York. Mr. Martin was a member of many scientific societies and published 'The Electric Motor and Its Applications' (1886); 'Inventions, Researches and Writings of Nikola Tesla' (1893); 'Edison — His Life and Inventions,' with F. L. Dyer (1910), and contributions to reference books, magazines and journals on electrical topics.

MARTIN, Thomas F., Democratic leader in New Jersey: b. in New England, about 1868. He came to Hudson County, N. J., in 1896, and worked as a reporter on the *Hudson Dispatch*. Later he became business manager, and when the publishing company failed bought in the property at auction, re-established the paper and made it a political power. Entering politics, he

was chosen to represent North Hudson in the state legislature. For several terms he was the Democratic leader in the House of Representatives, including Woodrow Wilson's governorship. After 1916 he served as secretary of the state of New Jersey.

MARTIN, Thomas Mower, Canadian artist: b. London, England, 1838; d. Toronto, Canada, March 16, 1934. He studied art at the South Kensington Art School; removed to Canada in 1862 and settled in Toronto, Ontario. His best-known pictures are *The Untamed Wilderness; A Summer Idyl; Sunrise, Muskoka.* He was one of the founders of the Royal Canadian Academy, the Ontario Society of Artists, the Art Union of Ontario, and the Ontario School of Art. His publications are *An Artist's Letters from the Rockies* (1889) and *Canada from an Artist's Point of View* (1895).

MARTIN, Thomas Staples, American legislator: b. Scottsville, Virginia, July 29, 1847; d. Charlottesville, Va., Nov. 12, 1919. In 1864–1865 he was a cadet at the Virginia Military Institute and for a year served with the cadets in the army of the Confederate States. In 1865–1867 he studied at the University of Virginia and in 1869 was admitted to the practice of law. From 1895–1919 he was United States senator from Virginia. During World War I he was majority floor leader of the Senate.

MARTIN, Victoria Claflin Woodhull, Anglo-American financier and reformer: b. Homer, Ohio, Sept. 23, 1838; d. Tewkesbury, England, June 9, 1927. In 1853 she married Canning Woodhull, from whom she later separated. Her second marriage was to John Biddulph Martin who died in 1897. With her sister Tennessee, in 1870, Mrs. Woodhull founded a stock brokerage house in New York, from which was issued *Woodhull and Claflin's Weekly.* For many years she edited the *Humanitarian Magazine.* In 1870 Mrs. Woodhull memorialized Congress for women's suffrage, and lectured throughout the United States on finance, women's suffrage, and religious and scientific improvement of the human race. In 1872 she was nominated for the presidency of the United States by the Equal Rights Party. She organized conventions for the discussion of social reform, carried on continuous propaganda work in the interests of the working classes both in America and Europe for over 30 years. Her publications include *The Origin, Tendencies and Principles of Government* (1871); *Stirpiculture* (1888); *The Human Body the Temple of God* (1890).

MARTIN, William Alexander Parsons, American educator: b. Livonia, Ind., April 10, 1827; d. Peking, China, Dec. 17, 1916. He was graduated from Indiana State University and studied theology. He went to China as a missionary in 1850 and spent the greater part of his life there in educational and missionary work. He assisted in making the treaty between the United States and China in 1858 and was an authority in China on questions of international law. He was professor and president of Tung Wen College 1868–1898, and president of the Imperial University until 1900, when it was destroyed in the siege of Peking, in which city he was imprisoned with the American legation. In 1902 he was appointed president of the University of Wuchang. In 1911 he rejoined the Presbyterian mission. He edited in Chinese the *Peking Scientific Magazine* and the *Science Monthly,* and has published *Siege in Peking* (1900); *Chinese Legends* and *The Lore of Cathay* (1901); *The Awakening of China* (1907).

MARTIN, William McChesney, Jr., American banker: b. St. Louis, Mo., Dec. 17, 1906. Graduated from Yale in 1928 he studied at Benton College of Law in St. Louis, and at Columbia. Previous to World War II he served in banks and banking firms; in 1935 he was governor of the New York Stock Exchange. He was elected president of the exchange in 1938 and in 1940, the first definite term of office in the history of the exchange. He served in the United States army from 1941 to 1945, finishing as colonel. He served on important government commissions, and became a member of the board of directors of the Export-Import Bank in 1945; assistant secretary of the Treasury, 1949 and chairman of the Federal Reserve Board. He is a trustee of the Foreign Service Educational Fund.

MARTIN DE MOUSSY, mȧr-tăN′ dĕ mōō′sē, **Jean Antoine Victor,** French physician: b. Moussy-le-Vieux, 1810; d. Paris, 1869. His medical education was obtained in Paris, where he practiced in the military hospitals. He removed to Montevideo, Uruguay, in 1841 and in 1843–1852 directed the medical service of the French and Italians engaged in the siege of the city. In 1852 Dr. Martin was engaged by the Urquiza government to prepare a work on the geography of Uruguay. In order to prepare himself for the task he traveled up and down the country in the years 1855–1859. The work appeared in three volumes under the title *Description géographique et statistique de la confédération argentine* (1864).

MARTIN, city, Tennessee, in Weakley County, at an altitude of 475 feet; 11 miles south of Fulton, Ky.; on the Illinois Central; and Nashville, Chattanooga and St. Louis railroads. The University of Tennessee Junior College is here. Pop. (1950) 4,082.

MARTIN, a swallow. In the United States the name is restricted to the purple martin (q.v.), several other species of which, genus *Progne,* are familiar garden birds in South America. The bank-swallow (q.v.) is sometimes called sand-martin, especially in England, where the term is more generally used as a synonym of "swallow" than in America. See also SWALLOW.

MARTINE, James Edgar, American legislator: b. New York, N. Y., Aug. 25, 1850; d. Feb. 26, 1926. He received a public school education; engaged in farming near Plainfield, N. J.; acquired real estate and building interests. When Woodrow Wilson was governor of New Jersey, Martine was one of his most ardent supporters and became United States senator for the term 1911–1917. In the Senate he warmly championed the cause of labor in the discussions in regard to working conditions, and wages, in the coal mines of West Virginia and Colorado.

MARTINEAU, mär′tĭ-nō, **Harriet,** English author: b. Norwich, England, June 12, 1802; d. Clappersgate, Westmoreland County, Eng., June 27, 1876. She was a sister of the philosopher James

Martineau (q.v.). Her first work, 'Devotional Exercises for the Use of Young Persons,' appeared in 1823; and in 1830–31 she won three prizes offered by the Central Unitarian Association for as many essays designed to convert respectively the Catholics, the Jews and the Mohammedans. "The essays," observes a biographer, "probably converted nobody, but brought in 45 guineas." Next came several stories, mostly intended to inculcate some useful lesson, such as those having the title, 'Illustrations of Political Economy' (1831–34), which were followed by 'Illustrations of Taxation' (1834), and gained an immediate recognition. After a sojourn in the United States (19 Sept. 1834–1 Aug. 1836), she published 'Society in America' (1837), intended as a comparison of "the existing state of society in America with the principles on which it is proposedly founded," and 'A Retrospect of Western Travels' (1838), including some criticisms of slavery that were not well received in this country. Up to about 1851 Miss Martineau had been known as a Unitarian; but she later showed a decided leaning toward Positivism, and in 1853 published a condensation of Comte's 'Positive Philosophy.' Among her other works of importance may be mentioned her 'History of England during the Thirty Years' Peace' (1849). During the last 20 years of her life her writings consisted mainly of pamphlets and contributions to newspapers and periodicals. A remarkably candid autobiography, which had been written for many years, was published after her death (1877). Consult also Miller, 'Harriet Martineau' (1884).

MARTINEAU, James, English Unitarian clergyman and philosopher: b. Norwich, 21 April 1805; d. London, 11 Jan. 1900. His father, Thomas Martineau, the great-grandson of a Huguenot surgeon who left France after the revocation of the Edict of Nantes, was a manufacturer of bombazines. Harriet Martineau (q.v.) was an elder sister. He was sent to Derby in 1821 to study civil engineering, but in the following year became a student of Manchester College. In 1827 he took charge for a year of Dr. Lant Carpenter's school in Bristol, and in 1828 he accepted a call to the copastorship of Eustace Street Presbyterian Church, Dublin. In 1831 he published 'Hymns for Christian Worship,' and next year resigned his pastorate, but shortly afterward accepted the copastorate of Paradise Street Chapel, Liverpool, of which, in 1835, he became sole pastor. In 1836 appeared his first separate original work, 'The Rationale of Religious Inquiry,' which attracted considerable attention. In 1839 he was associated with J. H. Thom and Henry Giles in the defense of Unitarianism against attacks by orthodox clergymen, and of 13 addresses published in 'Unitarianism Defended' (1839), five were by Martineau. In 1840 he published his collection of 'Hymns for the Christian Church and Home,' and in the same year was appointed professor of mental and moral philosophy and of political economy in his old college, now named Manchester New College. On the removal of the college to London in 1853 he retained his professorship, but did not settle in London till 1857. In 1848–49 he spent 15 months on the Continent, mostly in Germany, during which his philosophical opinions were profoundly influenced by the study of Greek and German philosophy under Trendelenburg. The remaining publications of his first Liverpool period are an essay on 'The Five Points of Christian Faith' (1841), and the well-known collection of sermons entitled 'Endeavors after the Christian Life' (1843–47). During the period 1849–57, when he was pastor of Hope Street Church, Liverpool, he published many articles in reviews, among them that on 'Mesmeric Atheism,' which finally completed his sister Harriet's estrangement from him. In 1859, being now in London, he and J. J. Taylor, principal of Manchester New College, were chosen joint ministers of Little Portland Street Chapel, but from 1860 till his resignation in 1872 Martineau alone supplied the pulpit. On Taylor's death in 1869 he became principal of the college, a post which he held till his resignation in 1885. In 1866 he was a candidate for the chair of logic and mental philosophy in University College, London, but the united opposition of orthodoxy and secularism led by George Grotte managed to defeat him by a single vote. His publications include 'Studies of Christianity' (1869), a volume of sermons; 'Why Dissent?' (1871); 'Hymns of Praise and Prayer' (1873); 'Modern Materialism: Its Attitude towards Theology' (1876), a masterly attack on Tyndall and the scientific materialists; 'Essays, Theological and Philosophical' (1875); 'Hours of Thought on Sacred Things' (1876–80); 'Ideal Substitutes for God Considered' (1880), a criticism of Moral Idealism; 'A Study of Spinoza' (1883), his first great philosophical work; and 'Types of Ethical Theory' (1885), the earlier of his two masterpieces. During the remaining years of his life he published his great defense of the essential principles of religion entitled 'A Study of Religion: Its Source and Contents' (1888); and his freely critical 'Seat of Authority in Religion' (1890). The first academical degree conferred upon him was that of LL.D. by Harvard in 1872, but he received later the degrees of S.T.D. from Leyden (1875), D.D. from Edinburgh (1884), D.C.L. from Oxford (1888), and Litt.D. from Dublin (1892). Martineau was one of the most eminent preachers of his time, but his greatest work was done in the fields of ethics and philosophical theology. At first a necessarian and utilitarian, he was latterly the great modern champion of free-will and intuitionalism. In the development of his Christology from a sort of Arianism to complete Humanitarianism, and in his ever-increasing insistence upon the continuity of revelation and the purely internal character of ultimate religious authority, he sums up more than any other the history of Unitarianism, and indeed of liberal theology generally during the 19th century. He was a powerful and eloquent champion of Theism against scientific agnosticism and materialism. All his works are written in a uniquely rhythmic style, characterized by a profuse and happy use of figurative language. Consult Jackson, 'James Martineau: A Biography and a Study' (1900); Sidgwick, 'Lectures on the Ethics of Green, Spencer and Martineau' (1902); Drummond, 'Life and Letters of James Martineau'; and Upton 'A Survey of Philosophical Work' (1902)

MARTINELLI, mär-tĭ-nĕl'ĭ, **Giovanni,** operatic tenor: b. Montagnana, Italy, Oct. 22, 1885. He began his musical career as a clarinetist in an Italian regimental band, and in 1910, after studying voice, he made his opera debut in a Milan production of Verdi's *Ernani.* He was heard by Giacomo Puccini, who engaged him to appear as Dick Johnson in *The Girl of the Golden West,* produced in Rome in 1911. Going to London in 1912, he sang at Covent Garden in *Francesca da Rimini* and *The Jewels of the Madonna.* In 1913 he joined the Metropolitan Opera Company, New York City, as a leading tenor, and after the death of Enrico Caruso in 1921 he assumed many of that great artist's roles. Besides singing at the Metropolitan Opera House for more than 30 years, he appeared in many other cities throughout the United States and also sang for the radio.

MARTINEZ, mär-tē'nĕs, city, California, seat of Contra Costa County, located on Suisun Bay 18 miles northeast of Oakland; it is served by the Santa Fe and the Southern Pacific railroads. At Martinez is a vertical lift bridge across Suisun Bay having a horizontal clearance of 291.5 feet. The city is in a fruit, livestock, mining, and petroleum region, and it has petroleum refineries, copper-smelting works, vegetable and fish canneries, and fertilizer plants. John Muir (q.v.) had his home here. Settled in 1849, Martinez was named for Vincente Martinez, commandant of San Francisco Presidio in 1823; it became the county seat in 1850. Government is by mayor and council. Pop. (1950) 8,268.

MARTINEZ DE CAMPOS, mär-tē'năth thā käm'pōs, **Arsenio,** Spanish soldier and statesman: b. Segovia, Dec. 14, 1834; d. Zaraus, Sept. 23, 1900. He served in the campaign in Morocco in 1859, in Mexico in 1861, and in Cuba, with the rank of colonel, from 1869 to 1872. Following his return to Spain he opposed the republican form of government set up in 1873, and during 1874–1875 he became a leader in the movement to restore the monarchy. He assisted in seating Alfonso XII on the throne in 1874, and in 1876 he inflicted a crushing defeat upon the Carlists. For these services he was promoted captain general. Sent to Cuba as commander in chief in 1877, he brought the island's insurrection to a close chiefly by means of concessions which, as premier in 1879, he endeavored unavailingly to carry out. From 1881 to 1884 he served as minister of war, and he was president of the Senate in 1886 and 1891. In April 1895 he was sent again to Cuba as governor general and commander in chief. He found the insurrection more formidable than he had anticipated, and the following January, when his attempts at conciliation proved a failure, he was recalled to Spain. Resuming his seat in the Senate, in 1899 he was, for the third time, its president.

MARTINEZ DE LA ROSA, lä rō'sä, **Francisco de Paula,** Spanish statesman and writer: b. Granada, March 10, 1789; d. Madrid, Feb. 7, 1862. He secured a law degree at the University of Granada, and while lecturing there on ethics he began publication of a series of epigrams on local celebrities under the title *El cementerio de momo.* With the arrival of the French in Spain he took an active part in the movement against the invaders. He supported the constitution of 1812, and with its abolition in 1814 he was sentenced to 10 years' imprisonment. The insurrection of 1820 brought him liberation and appointment as premier of Spain. He became unpopular and distrusted by both political parties, and in 1823 he resigned and went to Paris. There he remained until 1830, and in 1834 he again served as premier for a few months. During 1840–1844 he once more lived in Paris, and he served there as Spanish ambassador from 1847 to 1851. Besides verse, plays, and historical works, he wrote historical novels.

MARTINEZ SIERRA, syĕr'rä, **Gregorio,** Spanish playwright and novelist: b. Madrid, May 6, 1881; d. there, Oct. 1, 1947. For 10 years, while working as a journalist, he acted with the semi-professional Spanish Art Theater. He and his wife, Maria Lejarraga, the poetess, wrote and published under his name two volumes of verse, and subsequently they collaborated on most of the plays produced as by Martinez Sierra. In 1916 he organized the Teatro Eslava, in Madrid, and he also conducted a publishing house, Renacimiento (later the Biblioteca Estrella). From 1931 until two weeks before his death he lived in the United States, Argentina, and other countries. His volumes of poetry included *Floris de escarcha* (1900); and among his works of fiction were *Almas ausentes* (1900), *Sol de la tarde* (1904), and *Tu eres la paz* (1907). He was best known abroad for his play *Cancion de cuna* (*The Cradle Song*), produced in 1911, a quiet portrait of convent life with delicate insight into various feminine types; it provided Eva Le Galliene with the principal success of her Civic Repertory season of 1926–1927 in New York City. In 1931 Catalina Barcena took the leading role in the American motion picture version of his play, *Mama* (1912). Among many other plays by him were *La vida inquieta* (1913); *El reino de Dios* (1915); *Amanecer* (1915); *Don Juan de España* (1921); *Seamos feices* (1929); *Morirse es un error* (1936).

MARTINI, mär-tē'nē, **Ferdinando,** Italian writer and statesman: b. Monsummano, July 30, 1841; d. 1928. He founded the *Fanfulla della Domenica,* a periodical which he was editing in 1874, when he entered Parliament. During 1892–1893 he was minister of education in the administration of Giovanni Giolitti, and from 1898 until 1907 he served as governor of Eritrea. He was colonial minister during 1914–1916; and in 1922 he was appointed an Italian senator. Besides volumes of short stories, he published several novels, among them *I Nuovi Ricchi* (1863) and *La Marchesa* (1876); and other works included *Cose africane* (1896) and *Nell' Africa italiana* (1891). His comedy *La Vipera,* appeared in 1894.

MARTINI, Simone, Italian painter: b. Siena, 1283?; d. Avignon, France, 1344. His surname is sometimes given as DI MARTINO and, incorrectly, as MEMMI. He was a pupil of Duccio di Buoninsegna, becoming one of the leading exponents of the Sienese school of painting. Most of his frescoes were executed in the churches of Siena, Assisi, Naples, and Orvieto, many of them in collaboration with his brother-in-law, Lippo Memmi. At the invitation of Pope Benedict XII he went to Avignon in 1339, where

he executed frescoes in the cathedral and the papal palace, and where he met Petrarch and painted the portrait of Laura. He seems to have aimed at flat decorative effect rather than artistic boldness and originality in his wall painting, and his color is harmonious and fresh, though his faces are conventional. The large painting of the Madonna on the walls of the Palazzo Pubblico is his most important work at Siena (1315); at Florence is to be seen an *Annunciation* of his in the Uffizi, and fragments of his work also survive at Avignon.

MARTINIQUE, mär-t'n-ēk', island of the West Indies, an overseas department of France. One of the largest of the Windward Islands, it lies 25 miles south of Dominica and 20 miles north of St. Lucia. The island has a length of 40 miles and greatest width of 21 miles, the area being 385 square miles. Fort-de-France, the capital, is on a bay of the same name on the southwest coast of the island. Martinique is almost wholly of volcanic origin, the northern part being mountainous. The best known of the volcanoes are Mount Pelée (4,428 feet), in the north, which killed more than 30,000 persons and destroyed the town of Saint Pierre when it erupted in 1902; and Carbet (3,960 feet) in the northwestern part of the island. The mountain slopes still retain much virgin forest yielding both fine-grain and heavy timber. The average temperature is 75° to 88°F., with high humidity in areas sheltered from the trade winds. There are three seasons: cool and showery from December to March; warm and dry from April to July; and hot with torrential downpours from July to November. Many of the numerous streams become raging torrents during the rainy season. Animals and birds once peculiar to the island are now extinct. The mongoose is common; it has practically exterminated venomous snakes, of which the fer-de-lance used to be the most dreaded.

The Caribs, the earliest of the inhabitants known to white men, were annihilated by settlers by the end of the 17th century. Most of the present population are Africans or of mixed blood, the descendants of early French settlers who intermarried with the Caribs or with imported African slave women. The island was the birthplace of the Empress Josephine, consort of Napoleon. Most of the cultivable land is devoted to sugar, which, with rum, constitutes the chief export. Cacao, coffee, tobacco, and bananas are also produced in the fertile valleys. Secondary crops consist mainly of cassava, breadfruit, corn, a variety of fruits, cotton, cola, limes, and vanilla.

Martinique was probably discovered by Christopher Columbus, but it was not until 1635 that settlement was undertaken by Frenchmen under Pierre Belain, Sieur d'Esnambuc. The first development company disposed of its rights to Dyel Duparquet, who had become captain general of the colony in 1637, and his children transferred ownership to the French West India Company; in 1674 the island passed to the French crown. It was attacked by the British in 1666–1667, by the Dutch in 1674, and again by the British in 1693. Admiral Lord Rodney seized the island in 1762, but the French regained possession the next year; it was again in British hands from 1794 to 1802, and from 1809 to 1814. When France adopted a new constitution in 1946, Martinique was constituted an overseas department. There is an elected 36-member General Council; and the department sends 3 delegates to the French National Assembly in Paris, 2 to the Council of the Republic, and 1 to the Assembly of the French Union. Pop. (1950 est.) 273,000.

Consult Roberts, W. A., *The French in the West Indies* (Indianapolis 1942).

MARTINS FERRY, city, Ohio, in Belmont County, located on the Ohio River 19 miles south of Steubensville; it is served by the Pennsylvania, the Baltimore and Ohio, and the Wheeling and Lake Erie railroads. Its industrial activities center about steel and soft coal; products include tin plate, galvanized ware, and jewelry. Settled before 1785, it was incorporated as a town in 1865 and chartered as a city in 1885. In early years it was variously known as Norristown, Jefferson, and Martinsville; its present name commemorates Ebenezer Martin, who operated a ferry here in the 1830's. Government is by mayor and council. Pop. (1940) 14,729; (1950) 13,220.

MARTINSBURG, city, West Virginia, seat of Berkeley County, in the eastern panhandle 23 miles northeast of Winchester, Va.; it is served by the Baltimore and Ohio and the Pennsylvania railroads. Situated at the head of the Shenandoah Valley, the city is in the center of a rich agricultural region. Apples, peaches, and other fruit are packed, and the city also has some light industries. There are limestone quarries in the vicinity. Named for Thomas Bryan Martin, colonel in the Revolutionary War, it was incorporated in 1778 as a town and became a city about 1859. Government is by mayor and council. Pop. (1940) 15,063; (1950) 15,621.

Martinsburg in American Civil War.— Because of its strategic position at the top of the Shenandoah Valley, the city was an important objective in military operations. Both the Federals and the Confederates held it for short periods. In June 1863 Richard Stoddert Ewell's Confederate corps inflicted heavy losses on the Union forces here. Martinsburg was held by Federal Gen. Franz Sigel on July 1, 1864, and the next day he was menaced by the approach of the Confederates, under Jubal Anderson Early, who had been ordered to clear out the lower valley and wreck the Baltimore and Ohio Railroad. John Cabell Breckinridge's division, which marched on the main road to Martinsburg, drove back Union cavalry on outpost at Darkesville. Sigel, warned of approaching danger, burned his stores, collected his command, and, leaving Martinsburg on the night of the 3d, crossed the Potomac at Shepherdstown and occupied Maryland Heights. Early cleared the valley and advanced on Washington, and on the 11th Martinsburg was occupied by Sullivan's division of David Hunter's command, and remained in Union occupation until the 25th, when George Crook, being defeated by Early at Kernstown, was driven through Winchester, made a short stand at Martinsburg, and recrossed the Potomac at Williamsport. Early again occupied the town and destroyed the railroad on either side of it, continuing in possession until August 10, when, upon Philip Henry Sheridan's advance to Halltown, he abandoned Martinsburg and Winchester and fell back to Strasburg. He advanced from Strasburg on the 17th and reoccupied the formerly abandoned Martinsburg

on the 19th with his cavalry. From this time until September 17, the place was held alternately by Union and Confederate cavalry, on the 17th by Gen. William W. Averell's Union division. On that day Gen. Jubal Early left Winchester with a heavy force of infantry, cavalry, and artillery and on the 18th attacked and drove Averell from Martinsburg across the Opequon. Gen. Philip Sheridan defeated Early on the Opequon on the 19th, and drove him up the valley, and Martinsburg was again occupied by Union troops, to remain in their possession until the end of the war.

MARTINSVILLE, city, Indiana, seat of Morgan County, at an altitude of 599 feet, 31 miles southwest of Indianapolis on the West Fork of the White River, served by the Pennsylvania Railroad. The surrounding area grows grain and has good timber. There is a state forest in the vicinity. Artesian mineral wells in the city make it attractive as a health resort. The industrial products include bricks, flour, canned goods, dairy products, clay goods, hickory chairs and mineral water crystals. The city was founded in 1822. Pop. (1950) 5,991.

MARTINSVILLE, city, Virginia, and Henry County seat, but politically independent of the county, situated near the Smith River, altitude 1,128 feet, in the east foothills of the Blue Ridge Mountains, 62 miles south of Roanoke. It is in a region of farms and forest, where industrialism is developing. Factories here produce furniture, garments, mirrors, fiberboard products, and nylon; and textiles are spun, knitted, and dyed. There is a large tobacco market. The city was named for Gen. Joseph Martin (born 1740). It was founded in 1793 and became a city in 1929. It has a council and manager. Pop. (1940) 10,080; (1950) 17,251.

MARTINY, mär-tē'nĭ, **Philip,** American sculptor: b. Strasbourg, France, May 19, 1858; d. New York City, June 25, 1927. His boyhood was spent in France working in various studios. Early in the 1880's he came to America and made further studies under the direction of Augustus Saint-Gaudens. Martiny's efforts in decorative sculpture were conspicuously successful and his work improved this branch of art in the United States. Among his best-known works are the sculpture on the grand staircase of the Congressional Library, Washington; the Carnegie Library, Washington; the New York Hall of Records; two Chamber of Commerce groups, New York; the bronze doors of St. Bartholomew's, New York; *Soldiers' and Sailors' Monument,* Jersey City, N. J.; *McKinley Monument,* Springfield, Mass.; statue of Vice President Garrett A. Hobart at Paterson, N. J.; and the *Admiral de Gernay Monument* at Newport, R. I.

MARTYN, märʹtĭn, **Edward,** Irish dramatist: b. Masonbrook, County Galway, Jan. 31, 1859; d. Tulira Castle, Ardrahan, County Galway, Dec. 5, 1923. He was educated at Christ Church College, Oxford, and in 1899 became with William Butler Yeats and George Moore one of the founders of the Irish Literary Theatre (its was primarily the financial backing of the theater, although his play *The Heather Field* was produced with Yeats' *The Countess Cathleen* at the premier of the theatrical group in 1899. The same year Martyn founded the Palestrina Choir in Dublin, established for the reform of liturgical music, an organization that in 1903 became the Schola Cantorum for Dublin.

Martyn split with the Irish Literary Theatre in 1901 because he objected to the plays about the Irish peasants, insisting that an Irish literature must be built on higher standards. He served from 1904 to 1908 as president of Sinn Fein and in 1914 founded the Irish Theatre in Dublin, organized specifically for the production of plays in the Gaelic tongue and not about peasants, and also for productions of European masterpieces that had been translated into English. Martyn was a firm promoter of the Gaelic League, and once advocated a reform of Irish church architecture. He was a governor of Galway College and of the National University. His works include *Maeve* (1899); *The Tale of a Town* (1902), rewritten by George Moore and given in 1900 as *The Bending of the Bough; Grangecolman* (1912); and the *Dream Physician* (1918), a satire on Moore. His prose includes *Morgante the Lesser* (1890) and a pamphlet, *Ireland's Battle for Her Language.*

MARTYN, märʹtĭn, **Henry,** English missionary to India: b. Truro, Cornwall, Feb. 18, 1781; d. Tokat, Asia Minor, Oct. 16, 1812. He was graduated from St. John's College, Cambridge, in 1801; became a fellow of the same college in the next year, and, turning from the law, took orders, and landed in India in 1806. After three years at Dinapur he was transferred to Cawnpore, where he opened a church in 1810, in spite of violent opposition, and where he completed a Hindustani version of the New Testament. To perfect a translation of the New Testament into Persian and to recover his health in 1811 he traveled into Persia. In Tabriz he was taken ill with a fever, and on his hurried journey home was compelled to stop at the plague-stricken town of Tokat, where he died. In 1856 a monument to his memory was erected there. He was the great missionary hero of the Church of England up to the early part of the 19th century. Martyn's works include *Controversial Tracts on Christianity and Mohammedanism* (1824), and versions of various parts of the Bible into Hindustani, Persian and Judaeo-Persian.

MARTYN, John, English botanist: b. London, Sept. 12, 1699; d. Chelsea, Jan. 29, 1768. He was lecturer in botany at Cambridge (1732–1762), being almost wholly self-educated in the subject, and was also a practicing physician. He contributed to Nathan Bailey's *Universal Etymological English Dictionary* (1721) and wrote *Historia plantarum rariorum* (1728–1737); as well as translations of Virgil's *Georgics* (1741) and *Bucolics* (1749). He was a regular correspondent with Carolus Linnaeus.

MARTYNIA, mär-tĭnʹĭ-ȧ, a genus of annual and perennial herb of the family Martyniaceae. The eight species have thick sub-erect stems, opposite or alternate heart-shaped leaves, showy catalpalike flowers in short terminal racemes, and horned capsules which suggest the names unicorn plant and proboscis flower (*M. lutea*). When ripe the capsules split and expose numerous black wrinkled seeds. The stems and foliage are clammy and malodorous, but the flowers of some species not unpleasantly perfumed. The species are all natives of warm parts of Amer-

ica. They are often planted for ornaments, as curiosities and for their capsules, which while young and tender are used as material for pickles. *M. louisiana,* to which the popular names are generally applied, is the most commonly grown.

MARTYR, Peter. See PETER MARTYR.

MARTYR (Greek for "witness"), a designation applied by the Christian Church to those persons in particular who, in the early ages of Christianity, suffered death rather than renounce their faith, and thus testified their confidence in the truth of the new doctrines. Martyrs are sometimes classified as of three classes: martyrs in will and deed, like Saint Stephen; those in will, but not in deed, like Saint John, who escaped from the death ordained for him by Domitian; and those in deed but not in will, like the Holy Innocents. An account of the life, persecutions, and death of the Christian martyrs is called a martyrology (q.v.). A tomb or oratory erected on the spot where a martyr suffered was called martyrium, martyry. Festivals in honor of the martyrs seem to have been observed as early as the 2d century. The Christians offered prayers at the martyry and thanked God for the example which they had given to the world. The rite was concluded with the sacrament of the Lord's Supper and the distribution of alms. Eulogies were also delivered, and accounts of the lives and actions of the deceased read. These festivals were called the birthdays of the martyrs, because on the day of their death they were born to eternal life. There are 14,000 martyrs commemorated in the Roman Catholic martyrology. In the early centuries of Christianity the bishop of the locality certified the names of those who were deemed worthy of the title of martyr, but after 1100 this designation became more and more reserved to the pope, especially since 1636.

MARTYRE DE SAINT SEBASTIAN, Le (THE MARTYRDOM OF SAINT SEBASTIAN), an oratorio by Achille Claude Debussy which had its first performance at Paris on May 22, 1911.

MARTYROLOGY, called also calendar of the saints, the acts of the saints, menology, anology, synaxary, a list of martyrs and other saints, in which was sometimes noted the character of their lives, and in the case of a martyr the place and date of his martyrdom and the nature of the sufferings which he underwent. Caesar Baronius, an ecclesiastical historian of the 16th century, attributes to Saint Clement of Rome, almost contemporary with the apostles, the first idea of collecting the acts of the martyrs. In the time of Gregory the Great (end of the 6th century) the Roman Catholic Church possessed a general martyrology, the author of which is said to have been Saint Jerome, who made use of materials collected by Eusebius of Caesarea. The only part of it now extant is a catalogue of the martyrs who suffered in Palestine during the last eight years of the persecution of Diocletian. There is a martyrology attributed to Bede (beginning of 8th century), but if not altogether spurious it is at least interpolated. Numerous martyrologies were produced in the next century and subsequently. In 1586, under the auspices of Sixtus V, a martyrology was printed at Rome, with notes by Baronius, with the title of *Martyrologium Universale.* Ruinart's *Acta Primorum Martyrum Sincera* appeared at Paris in 1689, and a new edition of it was published in 1859. The *Acta Sanctorum* (q.v.) of the Bollandists comprises over 60 volumes issued at various times from 1643, but the work is still incomplete. The well-known English work of John Foxe, *The Book of Martyrs* (1563), may also be mentioned.

MARVEL, Ik. See MITCHELL, DONALD GRANT.

MARVELL, Andrew, English poet and satirist: b. Winestead, Holderness, Yorkshire, March 31, 1621; d. London, Aug. 18, 1678. He was graduated from Trinity College, Cambridge, in 1638, and after four years' continental travel he became in turn tutor at Nunappleton, Yorkshire, the scene of his lyrical poems, to Mary, daughter of Lord Fairfax and afterward duchess of Buckingham, and at Windsor to William Dutton, a nephew of Oliver Cromwell. In 1657 he was appointed John Milton's colleague in the Latin secretaryship, a post he retained until the Restoration. From 1660 he represented Hull in the House of Commons. Known in his lifetime chiefly as a Cromwellian, as a friend and colleague of Milton, as a member of Parliament, a pamphleteer, and a satirist, his fame as a poet came later. His widow published a collection of his miscellaneous poems in 1681, and an edition including the political satires was issued in 1726. The complete works did not appear until 1776. His poems, especially those on gardens and country life, display an exquisite feeling for nature and language. Those by which he is chiefly remembered are the *Horatian Ode upon Cromwell's Return from Ireland, On Appleton House, To His Coy Mistress, The Garden, The Bermudas,* and *The Nymph Regretting the Loss of Her Fawn.* In his satires he attacked the Earl of Clarendon and the court party, assailed Charles II, and finally, condemned the house of Stuart, despaired of Parliament, and favored a republicanism after the model of Rome and Venice. In *Growth of Popery and Arbitrary Government in England* (1677) he alleged that the king sought to reestablish Roman Catholicism and make himself an absolute ruler; and in *The Last Instructions to a Painter* he satirized the conduct of the Dutch War. A copy of the 1681 edition of his poems was acquired by the British Museum in 1921. The site of the cottage at Highgate in which Marvell lived is marked by a tablet in Waterlow Park.

MARVIN, Charles Frederick, American meteorologist: b. Putnam, Ohio, Oct. 7, 1858; d. Washington, D. C., June 5, 1943. He graduated as a mechanical engineer in 1883 at Ohio State University, where he had been an instructor in mechanical drawing and laboratory practice since 1879. In 1884 he was appointed a forecaster in the United States Weather Bureau (at that time part of the Army Signal Corps), and rose to become its chief in 1913. He retired in 1934. Besides conducting experiments upon which were based the bureau's tables for computing moisture in the air, he made exhaustive investigations of anemometers and invented instruments for measuring and automatically recording rainfall, snowfall, sunshine, and atmospheric pressure. He made use of kites for determining meteorological conditions in the free air, and made studies of the registration of earthquakes and of the measure-

ment of evaporation, solar radiation, and temperature by means of electric resistance thermometers. His work on wind velocities and standardization of the anemometer was particularly noteworthy. He invented the clinometer, an instrument to ascertain the exact height of clouds over airports. Besides publishing numerous papers on meteorology, he wrote on the simplification of the calendar. He advocated improving the Gregorian rule for leap years by omitting four leap years in 500 years; he asserted that such a change would assure accurate reckoning for more than 10,000 years.

MARVIN, Enoch Mather, American Methodist Episcopal clergyman: b. Warren County, Mo., June 12, 1823; d. Nov. 25, 1877. He was self-educated, and in 1841 became a minister of the Methodist Episcopal Church as member of the Missouri Conference. Upon the division of the Methodist body in 1844 he cast his lot with the Methodist Church South. In the American Civil War he was for two years a chaplain in the Confederate Army. He was chosen bishop of his church in 1866, and at the time of his death had just returned from a missionary tour which took him all around the world. He published *Errors of the Papacy and Transubstantiation* (1860); *The Life of William Goff Cables* (1871); *Sermons* (1876); *The Doctrinal Integrity of Methodism* (1878); *To the East by Way of the West* (1879); *The Methodist Episcopal Churches, North and South.*

MARVIN, Frederic Rowland, American clergyman, essayist, and poet: b. Troy, N. Y., Sept. 23, 1847; d. July 22, 1918. After attending Lafayette and Union colleges he studied at the College of Physicians and Surgeons and New Brunswick Theological Seminary. He became a professor at the New York Free Medical College for Women, and subsequently was a Congregational pastor at churches in Middletown, N. Y., Portland, Ore., and Great Barrington, Mass. In 1895 he retired in order to devote himself to study and foreign travel, and from 1900 he made his home at Albany, N. Y. His numerous books included *Literature of the Insane; Epidemic Delusions; Last Words of Distinguished Men and Women; Book of Quatrains; Excursions of a Book Lover; Poems and Translations; Companionship of Books; Christ Among the Cattle.*

MARX, märks, **Karl,** German Socialist: b. Trèves, May 5, 1818; d. London, England, March 14, 1883. He was educated at the universities of Bonn and Berlin, and in 1842 took up journalism, becoming editor of the Cologne *Rheinische Zeitung,* a Democratic journal; his socialistic articles in this paper caused its suppression in 1843. Marx then proceeded to Paris, where he became one of the editors of the *Deutsch-Französische Jahrbücher,* to which he contributed articles on the "Hegelian Philosophy of Right." He was expelled from France in 1845, and retired to Brussels, where he assisted in organizing the German Workingmen's Association; he was also active in the organization of the Communist League, and with Engels issued the famous Communist Manifesto in 1847, which was the first public declaration of international socialism. In 1848 Marx returned to Cologne and started the *Neue Rheinische Zeitung,* becoming active in the revolutionary movements of that year. Banished from Germany in 1849, he went first to Paris, then to London, where he lived till the time of his death. He devoted himself largely to the study of economic questions, and was correspondent of the New York *Tribune* and other periodicals. In 1864 he took a leading part in the organization of the International Workingmen's Association; he was selected to formulate its program and practically shaped its policy for a number of years. He was also interested in the organization of the German Social Democrats, who united with the International in 1869. After 1873 he took no active part in politics, but devoted his time to the completion of his work on capitalism, *Das Kapital,* the first volume of which had been published in 1867 (English trans. 1886); the second and third volumes were left in manuscripts, and volume II was published in 1885; volume III appeared in 1894, under the editorship of Friedrich Engels. He also wrote *Zur Kritik der Politischen Oekonomie* (1859); *Lohnarbeit und Kapital* (English trans., *Wage Labor and Capital*); *Misère de la Philosophie* (1847); *The 18th Brumaire of Louis Bonaparte* (1852); *Life of Lord Palmerston* (1850), and *Revolution and Counter-Revolution,* a reprint of a series of letters in the New York *Tribune,* in regard to the Revolution of 1848 in Germany.

Marx was undoubtedly the founder of the modern socialistic school, in that he first gave definite scientific statement to the principles of modern socialism. His greatest and best-known work, *Das Kapital,* is a monument of acute reasoning, extensive reading, and knowledge, though excessively long, obscure, and tortuous in its meanings. In this he analyzes carefully his theory of value, which is that the measure of the value of a commodity is the amount of labor "socially necessary" to produce it, and shows how under the capitalistic system the laborers are exploited of what they produce over and above their wages (surplus value). These theories were by no means new, though Marx rather confused than elucidated them. He also traces the development of capitalistic production, the growth of the working class or proletariat, which is finally to transform or revolutionize society, and lays down the principle that the fundamental factor in the development of society is the method of production and exchange; hence the Socialist movement must simply assist and hasten the changes in progress. Marx was not only a scholar and thinker, but an organizer and agitator of unusual power. See also COMMUNISM; SOCIALISM; UNION OF SOVIET SOCIALIST REPUBLICS—*History and Foreign Affairs.*

MARX, Wilhelm, German statesman: b. Cologne, Jan. 15, 1863; d. Bonn, Aug. 5, 1946. He studied jurisprudence at the University of Bonn, and subsequently became presiding judge of a county court; in 1923 he was appointed to the Berlin court. In 1899 he was elected to the Prussian Diet, and in 1910 he entered the German Reichstag, where he became a leading member of the Catholic Centrist Party. He was chosen president of his party in 1921, and two years later he succeeded Gustav Stresemann as chancellor of Germany, forming a minority government of Centrists, Democrats, and People's Party members. In 1924 he attended the Reparations Conference in London, and upon his return to Berlin he succeeded in securing a two thirds Reichstag vote for approval of the Dawes Plan. On the

strength of this vote he tried in the fall to form a majority cabinet, but when this failed he was forced to vacate the chancellorship in favor of Hans Luther. In January 1926 he was appointed minister for justice and occupied territories, and later that year, after the resignation of the Luther cabinet, he again became chancellor. He retired from political leadership after defeat at the elections in May 1928.

MARY, the mother of Jesus, is known in the Roman Catholic Church as the Blessed Virgin Mary. The name is from the Gr. Μαριάμ (Mariam) or Μαρία (Maria), which in turn is from the Hebrew Míryām, a word of uncertain meaning. The New Testament narrative is silent as to her parentage and the place and date of her birth. From tradition and other sources we learn that her father was Joachim and her mother Anne, that by them she was presented in the temple at Jerusalem when she was three years old, and that in the temple she remained until the age of 12 or thereabouts. Her birthplace is variously stated as being Nazareth, Sephoris (Diocaesarea), or Jerusalem. In early youth she was betrothed to Joseph, a carpenter, a scion of the house of David. She probably belonged herself to the same royal lineage. At all events, she was a cousin of Elizabeth, wife of the priest Zachary and mother of John the Baptist. While Mary was betrothed to Joseph, and before her marriage, she was visited at Nazareth, a city of Galilee, by the angel Gabriel, who announced to her that, by the operation of the Holy Ghost, she should conceive and bring forth a son, to whom was to be given the name Jesus, who should be called the son of the Most High, and who should reign over the house of Jacob forever. The angel also said that her cousin Elizabeth had conceived a son in her old age, and was then in the sixth month of her pregnancy. Mary thereupon visited Elizabeth in the hill country of Judah, and, in response to Elizabeth's salutation, "Blessed art thou among women, and blessed is the fruit of thy womb," she uttered under divine inspiration the glorious canticle of praise known as the *Magnificat.* The visit lasted about three months. On her return to Nazareth, Mary "was found with child, of the Holy Ghost." Matthew 1:18. Joseph, however, was in a dream told by an angel of the true condition of affairs, and, instead of putting her away privately, as was his first impulse, he concluded the ritual marriage with her.

Some few months later, in obedience to a decree of Caesar Augustus prescribing a general enrollment, Joseph went from Nazareth in Galilee to the city of David, Bethlehem in Judaea, because he was of the house and family of David, to enroll himself with Mary, who was then great with child. There was no room for them in the inn, and so in a grotto, which served as a shelter for animals, Mary gave birth to her son. On the eighth day afterward the child was circumcised, and was called Jesus, in accordance with the instruction previously given by the angel Gabriel. Thirty-three days later Mary complied with the law of Moses (Leviticus 12:2-8) by offering herself in the temple at Jerusalem for legal purification, and at the same time she presented her child to the Lord in accordance with Exodus 13:2, 12 and Numbers 18:15. On this occasion Simeon pronounced the canticle of joy known as *Nunc Dimittis.* He told Mary that her child was set for the fall and for the resurrection of many in Israel and for a sign that should be contradicted, and that her own soul a sword should pierce. Anna the prophetess, on the same occasion, confessed to the Lord, and spoke of the child to all that looked for the redemption of Israel. A great danger threatened the life of Mary's son. Herod the Great, king of Judaea, having seen and questioned the Wise Men who had come from afar to pay homage to the newly-born King of the Jews, whose star they had seen in the East, concealed the alarm which these strange tidings caused him, directed the strangers to Bethlehem as the city indicated by prophecies for the birth of Christ, and adjured them to let him know, on their return to Jerusalem, where the young king was to be found, so that he too might come and pay him homage. The Wise Men, after offering to the infant Jesus their gifts of gold, frankincense and myrrh, were warned by God in a dream not to go back to Herod, and accordingly they departed by another way into their own country. Herod, not hearing from them, was enraged, and issued an order that every male child two years of age and under in Bethlehem and its borders should be put to death. In the meantime, Joseph, being warned by an angel, had taken the child and his mother and fled into Egypt, and thus the infant Jesus escaped the Slaughter of the Innocents. How long the sojourn in Egypt lasted we do not know. What we are told is that Joseph, advised by an angel of the death of Herod, returned to the land of Israel, but, learning that Archelaus was reigning in Judaea in the room of Herod his father, he decided to go, not to Bethlehem, but to Nazareth, and in the latter city the Holy Family took up their abode.

The chronology of Matthew and the chronology of Luke, the only evangelists who give an account of the events immediately preceding and immediately following the birth of Christ, are at first sight somewhat confusing, but they are not conflicting, and are quite capable of reconcilement, although in this case, as in so many others, the reconcilement will not wholly square with the popular belief.

After the return to Nazareth, Mary makes but few appearances in the Gospel narrative. We learn that she and Joseph went every year to Jerusalem at the solemn day of the pasch, and that on one of those occasions they lost Jesus, who was then 12 years old, and did not find him until after a three days' search. We next find her at the marriage feast at Cana in Galilee, where Jesus, at her request, performed his first public miracle by changing water into wine. After this she accompanied Jesus to Capernaum. Once the mother and brethren of Jesus sought to speak to him, but could not reach him for the crowd. During the passion Mary stood by the cross of Jesus on Calvary, and from the cross Jesus commended her to John, who from that hour took her to his own. The last mention of her in the New Testament occurs in the Acts of the Apostles 1:14, where it is written that, between Ascension and Pentecost, the apostles were in an upper room in Jerusalem persevering with one mind in prayer with the women, and Mary the mother of Jesus, and with his brethren. After that time we have no certain information as to where she lived, nor do we know when and where she died. One tradition says that she lived with St. John at

phesus and died there; another, that she lived nd died at Jerusalem about A.D. 45. Baronius i his *Annals,* gives the date of her death as .D. 48. In fixing that year he relied on a pas- age in the *Chronicon* of Eusebius; but there grave doubt as to the genuineness of that assage in the *Chronicon,* and the present tend- ncy is to regard it as a later interpolation. The elief that, after her death, the body of Mary as assumed into heaven has been universally eld by Roman Catholics throughout Christen- om. It became a matter of faith when the octrine of the Assumption was defined and pro- aimed by Pope Pius XII on Nov. 1, 1950. he Catholic Church teaches that Mary was con- ived without original, or racial, sin; that she ever committed actual, or personal, sin; that ie was truly the mother of God; and that she ways remained a virgin. The doctrine of the nmaculate Conception (q.v.) was not explicitly scussed until the 12th century; but it is claimed at it is implicitly contained in the teachings the early Fathers of the Church. The fes- val of the Conception of the Blessed Virgin was rtainly celebrated in the Greek Church in the h century. It was possibly kept in Spain in the me century. It was observed in Ireland as rly as 900, in parts of Italy before 1000, and England, France and Germany in the 12th ntury. St. Bernard, himself a devout client Mary, upbraided the canons of Lyon for in- ituting (1140) such a festival without the nction of the Holy See. He himself did not lmit that her conception was sinless. St. homas Aquinas, the Dominican, and St. Bona- ntura, the Franciscan, hesitated to accept the octrine of the Immaculate Conception on the round that, unless Mary had been at some time e of the sinful, she could not truly be said to ve been redeemed by Christ. John Duns cotus, the Franciscan, put forward, on the other nd, the doctrine of preredemption. He held at it was as high a tribute to the merits of nrist to assert that Mary was by Him kept free om all taint of original sin, as to say that she rst contracted sin and was subsequently deliv- ed from it. This view, at first seriously and en angrily contested, gradually spread, and thered force and momentum with the progress time. The Council of Trent declared that in decrees on original sin it did not include he blessed and immaculate Virgin Mary, other of God." At length Pope Pius IX, on ec. 8, 1854 promulgated the Bull, *Ineffabilis eus,* in which is given the authoritative defini- on, as follows. "We define that the doctrine nich holds that the Blessed Virgin Mary, om the first instant of her conception, was, by singular grace and privilege of Almighty God, view of the merits of Jesus Christ, the Re- eemer of the human race, preserved from all ain of original sin, is a doctrine revealed by od, and therefore to be firmly and steadfastly lieved by all the faithful."

The dogma of the Immaculate Conception is jected by the general body of Protestantism, many schismatics, and by the sect known as ld Catholics.

Scripture and tradition agree in attributing Mary the greatest personal sanctity, and there no dispute that the church has always held r to be free from the commission of actual, personal, sin. St. Augustine crystallizes this ew when he says (*De natura et gratia,* c.36) that, out of honor to the Lord, he wishes no question to be made of the holy Virgin Mary when sin is treated of. Her complete freedom from actual sin is confirmed by the Council of Trent (Sess. VI, can. 23): "If any one say that man, once justified, can during his whole life avoid all sins, even venial sins, unless by a special divine privilege, as the church holds in regard to the Blessed Virgin, let him be anathema."

In the New Testament Mary is called "the mother of Jesus" (John 2:1, 19, 25, 26; Acts 1: 14) and "mother of my Lord" (Luke 1:43), and there are attributed to her the usual functions of motherhood, namely, conception, gestation, parturition, and giving suck; but she is not specifically designated "mother of God." The belief that that title was properly her due prevailed, however, in the church from the beginning. The term Θεοτόκος (Lat. *Deipara* = mother of God) was probably first formally applied to her toward the end of the 3d century by theologians of Alexandria. It occurs, for example, in the works of Origen. It came into common use in the 4th century, being found in the writings of Eusebius, Athanasius, Didymus, and Gregory of Nazianzus. As St. Cyril of Alexandria put it (*De Recta Fide ad Regin.,* c.9), "This name Θεοτόκος was perfectly familiar to the ancient Fathers." Nestorius, however, contended that Mary was not rightfully called mother of God, as she was the mother, not of God, but of a mere man. Thereupon the Council of Ephesus (431) laid it down as an article of faith that Mary is really and truly the mother of God. The words of the decree are: "If any one does not confess that Emmanuel is truly God and consequently that the holy Virgin is the mother of God (Θεοτόκον, *Dei genitricem*)—inasmuch as she gave birth in the flesh to the Word of God made flesh, according to what is written: *The word was made flesh*—let him be anathema." This decree was confirmed by several later Councils, e.g., Chalcedon (451) and Constantinople (553). It may be added that this teaching was sanctioned in the English Church, for in the first Book of Common Prayer (1549) Mary is called "mother of Thy Son Jesus Christ our Lord and God," and it is still accepted by many, perhaps most, Anglican divines.

The title ἀεὶ παρθένος (Lat. *semper virgo,* ever virgin, always a virgin), which represents a very early belief in the church, was incorporated in the Creed by the Fifth Ecumenical Council of Constantinople in 553—"qui de coelis descendit et incarnatus de sancta gloriosa Dei genitrice et semper virgine Maria (ἐκ τῆς ἁγίας ευδόξου Θεοτόκον καὶ ἀειπαρθένον Μαρίας) natus est ex ea." The doctrine of Mary's perpetual virginity, that is, that she remained a virgin before, during, and after parturition, was further emphasized by the Lateran Council in 649 and by the Sixth Ecumenical Council of Constantinople in 680. It is indisputably orthodox both in the Eastern and the Western Church. It is not accepted by Protestants in general, and has been the object of severe attack by modern Rationalists and infidel Bible critics.

The principal feasts held in honor of the Blessed Virgin are the Purification, February 2 (February 14 in the Armenian Church); the Annunciation, March 25; the Visitation, July 2; the Assumption, August 15; the Nativity of

Mary, September 8; the Presentation of Mary in the Temple, November 21; and the Immaculate Conception, December 8 (December 9 in the Eastern Church). There are, besides, many minor feasts, some locally celebrated, and others general.

Devotion to the Blessed Virgin has been prevalent in the church from very early times. It received a fresh impetus from the above-mentioned decree of the Council of Ephesus. The relationship of motherhood in which Mary had been declared to stand to God, stamping as authoritative the already existing popular belief, made invocation of her as a powerful intercessor with her divine Son a natural corollary, and devotion to her grew apace. In the Middle Ages it was widespread. In England it was so common and entered to such an extent into practical life that that country was long known as Mary's Dowry. The prominence which Mary had thus attained in Roman Catholic devotions and in popular estimation produced a reaction among the Reformers. They believed indeed in the birth of Christ from a pure virgin, who was consequently to be honored as His mother; but their fundamental position, that the justification and salvation of sinful man are accomplished through faith in Christ alone, caused them to repudiate the idea of a mediator with *the* mediator, of any creature coming as intermediary between the soul and Christ. The inevitable result, among Protestants, was an immediate dethronement of the mother from her high place as intercessor with her Son, and the immediate or later denial and striking away of some of her proudest prerogatives. This change of attitude is made evident, for example, in the first Book of Common Prayer (1549) of the English Church, in which the words of the Sarum rite, "glorious and ever Virgin Mary," are changed to "glorious and most blessed Virgin Mary," and still more evident in the second Book (1552) and in the 15th and 22d Articles of Religion (1553). In some sections the Puritan element in Protestantism carried its feeling against Mary so far as to scruple the singing of the *Magnificat*, and to abandon the public use of the Apostles' Creed because her name occurs in it. Even as recently as 1898 this spirit of opposition to any honor or invocation of Mary succeeded in securing the rejection of the *Stabat Mater* from the *Church Hymnary* and the removal of the words, "Son of Mary," from one of the hymns. Such extremes, however, brought about another reaction. In the 18th century even the Scottish Church introduced the Virgin into the public services in one of its "Paraphrases," in another restored the use of the *Magnificat* in meter, and in recent years authorized the singing of it in prose and the recital of the Nicene and Apostles' Creeds. The English liturgy never abandoned these. Further, it retained, and still retains, in its Calendar, among the "Feasts to be observed," several festivals of the Blessed Virgin. Many Scottish and English divines have written of Mary in terms of great reverence, tenderness, and beauty.

It may be fairly stated that at no time in the history of the Catholic Church have love of Mary and devotion to her been purer or more extensive and intensive than they are at the present day. The Ave Maria is second only to the Lord's Prayer in frequency of use. The Rosary and the Litany of the Blessed Virgin are recited publicly and privately by millions of perso every day. Special hymns composed in h honor, like the *Ave, maris stella*, the *Stab Mater*, the *Alma Redemptoris Mater*, and t English *Daily, daily sing to Mary*, are frequent said or sung. At the end of every low Ma three Ave Marias and the *Salve Regina*, as we as other prayers, are publicly recited in t vernacular by the priest and the congregatio The month of May is dedicated to Mary, a devotions in her honor are publicly conduct every day during that month. Every day October the Rosary of the Blessed Virgin publicly recited. Every Saturday in the year specially dedicated to her. Sodalities establishe in her honor exist in every land. In all this t church, following the teaching of the Fathe and the Councils and especially of the Council Trent (1545–1563), always carefully distinguish between the adoration or supreme homage due God alone and the reverence that may proper be shown to any of His creatures. Epiphani long ago laid down the rule: "Let Mary be he in honor. Let the Father, Son, and Holy Gho be adored, but let no one adore Mary (τ Μαρίαν μηδεὶς προσκυνείτω)." *Latria* is th name given to the adoration of God; *dulia* is th name given to the honor shown to the saints to angels. As Mary is above all saints an angels—"Queen of angels" and "Queen of a saints" she is entitled in her Litany—the degre of veneration shown to her is called *hyperduli* which, while it is greater in degree than *dulia*, infinitely below *latria* and differs in essence fro it. Not every Catholic knows those words; bu every Catholic, no matter how ignorant othe wise, feels and knows the distinction which the connote.

What Christian art owes to Mary it would b well nigh impossible to tell. Painters, sculptor architects, musicians, and poets have outdon themselves in celebrating her praise. (Se MADONNA IN ART.) Shrines in her honor spran up everywhere. In pre-Reformation Englan the country was studded with such shrines, th most celebrated being our Lady of Walsingham in Norfolk. Among modern shrines the famou ones of the Holy House of Loreto in Italy, Ein siedeln in Switzerland, Lourdes in France, an Guadalupe in Mexico may be singled out fo special mention.

It is of interest to note that, by decree of th Sixth Provincial Council of Baltimore (184 confirmed 1847), the Blessed Virgin Mary, con ceived without sin, was chosen as the patron o the United States of America.

P. J. LENNOX,
Professor of English Language and Literature The Catholic University of America.

Bibliography.—The amount of reading matter on thi subject is, as might be expected, immense both in quantit and range. The following books may with advantage b consulted on the points with which they deal: Locrius *Maria augusta Virgo Deipara* (Atrebati 1608); Dudinck *Mundus Marianus* (Coloniae 1644); Riccardi, *Storia de Santuarii più celebri di Maria Santissima sparsi nel mond cristiano*, 4 vols. (Milano 1840–44); Newman, J. H. *Development of Christian Doctrine* (London 1845); Pas saglia, *De immaculato Deiparae semper Virginis concept . . . commentarius*, 3 vols. (Rome 1854–55); Gousset, T. *La Croyance générale et constante de l'Église touchan l'immaculée conception de la bienheureuse Vierge Mari* (Paris 1855); Pusey, E. Bibliography brought to date by Editorial Staff, "Encyclopedia Americana."

MARY I (MARY TUDOR; often called BLOODY MARY), queen of England: b. Greenwich, Feb. 18, 1516; d. London, Nov. 17, 1558. The daughter of Henry VIII and his first wife, Catherine of Aragon, she was brought up as heir to the throne but was harshly treated by her father after his divorce of Catherine. Mary was even forced to sign a declaration acknowledging the union of her parents to have been illegal and renouncing the authority of the pope. Nevertheless she remained faithful to the Roman Catholic religion, living in retirement, chiefly at Hunsdon and Kenninghall, until the death of Edward VI, her half brother, on July 6, 1553. Despite the efforts of the duke of Northumberland to secure the succession for Lady Jane Grey, Mary had popular support and was proclaimed queen in London on July 19. Her reign was inaugurated by a series of acts of Parliament declaring her legitimacy, restoring the Latin Mass and the celibacy of the clergy, and abolishing the title of supreme head of the church which her father had assumed. New bishops were consecrated, and by December 1554 the reconciliation with Rome was virtually complete. In face of strong popular opposition, in July 1554 Mary married Philip II of Spain. Insurrections broke out, and after the suppression of that in Kent under Sir Thomas Wyatt (Wyat) her half sister Elizabeth (who was to succeed her on the throne) was imprisoned in the Tower of London and Lady Jane Grey and her husband, Lord Guildford Dudley, were executed. A stern persecution of Protestants began in 1555. The queen, embittered perhaps by her early life, by the failure of her marriage, and by bad health, must bear some share of responsibility for the persecutions which brought some 300 persons to the stake during the last three years of her reign. Those who thus perished included the bishops John Hooper, Hugh Latimer, Thomas Cranmer, and Nicholas Ridley. They were not so much victims of Bloody Mary as victims of the abrupt and ill-adjusted return to the old laws against heresy. Under the influence of Philip II, in 1557 England was forced into the existing war between Spain and France. The loss of Calais to the French in 1558, after it had been in the hands of the English for above 200 years, was a disgrace which told acutely upon Mary's already disordered health and proved to be the final blow in an unhappy life.

Bibliography.—Mullinger, J. B., "Philip and Mary," in *Cambridge Modern History*, vol. 2 (London 1904); Hume, M. A. S., *Two English Queens and Philip* (New York 1908); Froude, J. A., *The Reign of Mary Tudor* (New York 1910); Henderson, D. M., *Crimson Mary: Mary Tudor* (New York 1933); White, B., *Mary Tudor* (New York 1935); Prescott, Hilda M., *A Spanish Tudor: The Life of Bloody Mary* (New York 1940).

MARY II, queen of England, Scotland, and Ireland: b. London, April 30, 1662; d. there, Dec. 28, 1694. She was the daughter of James, duke of York (later James II), and Anne Hyde, his first wife. In November 1677 she was married to William, Prince of Orange, her cousin, and went to live in the Netherlands. After her father ascended the English throne in 1685 she was placed in a difficult position, because he began to show special favor to Roman Catholics and her husband (stadholder of Holland since 1672) was a recognized Protestant leader in Europe. She took the side of William against James at the time of the Revolution in 1688, and in February of the next year followed her husband to England. The pair were proclaimed joint sovereigns, with William III as sole administrator, and were crowned on April 11, 1689. During the absence of William in Ireland in 1690–1691 she managed affairs at home with extreme prudence, and she acted with equal ability as regent in 1693 and 1694. She endowed William and Mary College (q.v.), in Virginia, which was originally intended for the training of missionaries.

MARY (MARY OF MODENA), consort of James II of Great Britain: b. Modena, Italy, Oct. 5, 1658; d. France, May 7, 1718. She was the only daughter of Alfonso IV, duke of Modena, her full name being Maria Beatrice Anne Margaret Isabel d'Este. On Sept. 30, 1673, she was married by proxy to James, duke of York (his second marriage), and joined him in England the same year. There she became extremely unpopular, being regarded as a papal agent, and the birth of her first son (who died in infancy) in 1675 was not welcomed. Her husband ascended the throne in 1685, and when she gave birth to a second son, James Francis Edward (later known as the Old Pretender), in June 1688, it was widely believed that an imposture had been perpetrated. In December 1688, she preceded her husband in flight to France, and there Louis XIV gave them a home at Saint Germain. A daughter, Maria Louisa, was born to her in 1692. After the death of her husband in 1701 she persuaded Louis to recognize her son as the rightful king of England. Her last years were spent in a convent.

MARY, consort of George V of Great Britain: b. London, May 26, 1867; d. there, Mar. 24, 1953. She was only daughter of the duke of Teck (1830?–1900) and Mary Adelaide, daughter

of Adolphus, duke of Cambridge, and the granddaughter of George III. In 1891 she was betrothed to Albert Edward duke of Clarence, eldest son of the prince of Wales (later Edward VII, in succession to his mother, Victoria). He died, however, on Jan. 14, 1892, and on July 6, 1893, she married George, duke of York, his brother. Their six children comprised two who eventually ascended the throne, Edward VIII and George VI; Mary, Princess Royal (1897–); Duke of Gloucester (1900–); Duke of Kent (1902–1942); and Prince John (1905–1919). On the acession of Edward VII in 1901, the duke of York became duke of Cornwall, and before the year closed he was created prince of Wales. George V ascended the throne on May 6, 1910, and Mary was crowned with him as queen consort on June 22, 1911. She was styled queen mother when her sons were on the throne; and dowager queen mother on the accession in 1952 of Elizabeth II, her granddaughter.

MARY (QUEEN OF SCOTS) (MARY STUART), queen regnant of Scotland: b. Linlithgow, Dec. 8, 1542; d. Fotheringhay, Northamptonshire, England, Feb. 8, 1587. She was the only lawful surviving child of James V, her mother being his second wife, Mary of Guise (Mary of Lorraine); through her grandmother, Margaret Tudor (consort of James IV), she was heir to the throne of England after the children of Henry VIII. With her father's death six days after her birth she was proclaimed queen, and on Sept. 9, 1543, she was crowned at Stirling Castle. Negotiations for her betrothal to Edward, Henry VIII's son and later Edward VI of England, came to nothing, and in 1548 she was betrothed to the French dauphin, Francis (later Francis II), and sent to Paris. There she was brought up in the Roman Catholic faith at the French court under the charge of the Guises, the kinsfolk of her mother, who remained in Scotland and ruled on the child's behalf. In 1558 Mary was married to the dauphin, and when he succeeded to the French throne the following year she became his queen consort. Both her mother and her husband died in 1560, and in 1561 she returned to Scotland, which had largely become Protestant through the Reformation.

Yielding to the demands of John Knox, she consented to the maintenance of Presbyterianism, but she was permitted to hear Mass in her private chapel. She was left to fight her own battles and to select a husband from a crowd of suitors, and chose her cousin, Henry Stewart, Lord Darnley, whom she married on July 29, 1565, and on whom she bestowed the title of king. Finding Darnley a broken reed, she gave all her confidence to David Rizzio, her private foreign secretary, who had arranged the marriage but now acquired great political power. With the queen's refusal of Darnley's demand that the crown be secured to him for life and to his heirs, her husband conspired with James Douglas, 4th earl of Morton and other nobles to murder Rizzio. He was dragged from Mary's supper table at Holyrood Palace on March 9, 1566, and hacked to death with daggers.

Mary never forgave her husband, although there was a formal reconciliation three months later after she had given birth to a son (later James VI of Scotland and eventually James I of Great Britain). James Hepburn, 4th earl of Bothwell, assisted her in banishing the murderers of Rizzio, and he was suspected of superintending the subsequent murder of Darnley, whose outrageous behavior had lost him all support in Scotland. On Feb. 9, 1567, when Darnley was lying ill at a house called Kirk 'o Field, near Edinburgh, and Mary was absent attending marriage festivities at Holyrood Palace, the house was blown up and Darnley was found strangled in the yard. Bothwell was merely subjected to a mock trial and acquitted. On April 24 he captured the queen herself, after a barely formal show of resistance, and on May 15, 1567, after he had divorced his wife, Mary married him in a Protestant church. This act turned all the Scottish nobles against her, and on June 15, one month later, their forces faced that of Mary and Bothwell at Carberry Hill. After parley instead of combat, Bothwell escaped and fled the country, while Mary surrendered to the lords, by whom she was imprisoned at Loch Leven Castle where, on July 24, she was compelled to abdicate in favor of her son. Mary escaped from Loch Leven on May 2, 1568, but only a few devoted loyalists gathered to her standard. They were defeated at Langside by the Earl of Moray (Murray) on May 13, and Mary thereupon fled to England.

Elizabeth I, who was guided by policy rather than generosity, almost immediately imprisoned Mary, who was held captive the rest of her life. A commission sat at York, nominally to hear the defense of the Scots lords for their rebellion, actually in order that their charges against Mary might be published. The commission was closed without giving her any opportunity of rebutting their evidence. Roman Catholics subsequently formed plot after plot to liberate her and set her on the throne of England, to which, if the marriage of Anne Boleyn (mother of Elizabeth I) to Henry VIII was really invalid, she had an irrefutable claim on the score of descent.

Each plot was detected, but without investigation of Mary's complicity—for neither her acquittal nor her condemnation would have suited Elizabeth's plans. But when war with Spain had actually been declared in 1586, Elizabeth's secretary, Sir Francis Walsingham, was given a free hand. The strict supervision of Mary's correspondence was ostensibly withdrawn, but really maintained more closely than ever. The plot of Anthony Babington (q.v.) was revealed. At the trial, letters of Mary's were produced which, if genuine, were absolutely damning; but whether the damning parts of them (approving the assassination of Elizabeth) were genuine or forged no man will ever know. Mary was found guilty on October 25, and Parliament demanded her execution. Elizabeth, after efforts at evasion, sealed the death warrant on Feb. 1, 1587. The council, without giving her time to recall it, put it in execution, and Mary was beheaded at Fotheringhay.

Mary was of a dazzling complexion—apparently her main claim to beauty—marvelously winning, and clever in argument—as was evidenced nowhere more plainly than in her trial for treason. The moot point in Mary's tragic history is whether she was a party to Bothwell's murder of Darnley. That she was, is apparently proved by letters (the Casket Letters) from her to Bothwell which the Scottish nobles declared they found in Bothwell's jewel case; but the originals of these letters are not to be found, and their authenticity is doubtful. Irrespective of the authenticity of these letters, Mary's guilty knowl-

edge of the plot against Darnley seems indubitable.

The story of Mary has frequently been utilized in poems and dramas. She figures in Sir Walter Scott's *The Abbot;* is the subject of Johann Schiller's tragedy *Maria Stuart;* of a trilogy of plays by Algernon Swinburne—*Chastelard, Bothwell,* and *Mary Stuart;* and of John Drinkwater's *Mary Stuart.* Björnstjerne Björnson made his reputation as a dramatist with *Mary, Queen of Scots;* she also figures in Maurice Hewlett's novel *The Queen's Quair* and in Maurice Baring's *In My End is My Beginning.*

MARY, mä-rĭ′, oblast, USSR, in Turkmen SSR, Central Asia, located on both sides of the Murghab River and bordered by Afghanistan. The oblast extends into the Kara Kum (Qara Qum) Desert. Its area is 34,700 square miles.

Cotton is the chief product; wheat and alfalfa are also grown. Goats and karakul are raised in the desert areas. On the upper part of the Murghab River are groves of pistachio trees.

The oblast is crossed by the Trans-Caspian Railroad which passes through the Murghab oasis. Pop. (1946 est.) 350,000.

MARY, mä-rĭ′ (formerly MERV), town, USSR, seat of the oblast, Mary (q.v.), in the Turkmen Soviet Socialist Republic. It is located in the southeastern part of Turkmenistan, in the center of the Mary oasis, on the Murghab River 180 miles east of Ashkhabad. The oasis, some 1,500 square miles in area, is extremely fertile, much of it being irrigated. Besides cotton, which is extensively cultivated, grain crops, sugar, and rice are produced in the oasis. The town is of great antiquity. According to Hindu, Parsi, and Arab tradition it was the ancient Paradise, the original home of the Aryans, and became a great cultural center. In the 4th century it was the seat of a Nestorian archbishopric; and in the 7th the town passed into the possession of the Arabs. The oasis was occupied by the Turks in 1040, and in 1221 it was conquered by the Mongols. Thereafter the ancient town fell gradually into ruins, and the area was possessed successively by Uzbeks, Persians, and Bukhari. The Khivans subjugated the region in 1815, and in 1883 it was occupied by the Russians; a new town soon sprang up on the opposite side of the Murghab. The town was taken by the Bolsheviks on Aug. 22, 1918. Pop. (1939) 37,100.

MARY, feminine Christian name. Its meaning is somewhat doubtful, but its origin is the Hebrew Miriam, generally taken to mean bitterness, though some trace it to the Egyptian Mer Amon, beloved of (the god) Amon.

Owing to its having been the name of the Virgin Mother, it has always been, in Christian communities, a very popular feminine Christian name, while in Roman Catholic countries it is often given to men. The Greek and Latin form is Maria.

MARY MAGDALENE, mâr′ĭ măg-dâ-lē′nē (in Douay Version, MARY MAGDALEN, măg′dâ-lĕn; also, MARY OF MAGDALA, măg′dâ-lâ). In the New Testament, the name of the woman mentioned with others as being healed of evil spirits and ministering to Jesus of her substance. She was present at the crucifixion, and it was to her that Jesus is said to have first appeared after the Resurrection. The name is generally understood as indicating that she was a native of Magdala, on the west shore of the Sea of Galilee. Tradition identified Mary of Magdala with the unnamed penitent (Luke 7:36–50) who anointed Jesus with the spikenard.

MARY OF BURGUNDY, duchess and heiress of Burgundy: b. Feb. 13, 1457; d. March 27, 1482. She succeeded her father, Duke Charles the Bold, in 1477, only to have the duchy seized by Louis XI of France. In order to secure the aid of her Flemish subjects, she thereupon signed the Great Privilege, which restored to the people of the Netherlands the rights and liberties which had been taken from them by her father and grandfather (Duke Philip the Good). She refused the proposal of Louis XI that she marry Charles, the French dauphin, and on Aug. 18, 1477, married Archduke Maximilian of Austria (who became king of Germany in 1486 and Holy Roman emperor in 1493). Their elder son Philip (later Philip I of Spain) succeeded to her domains; and their daughter, Margaret of Austria, married Philibert II, duke of Savoy.

MARY OF FRANCE (MARY TUDOR), consort of Louis XII of France: b. 1496; d. June 24, 1533. She was the daughter of Henry VII of England and Elizabeth of York. In 1508 she was betrothed to Charles, prince of Castile (later Emperor Charles V), but the marriage plans were abandoned in 1514, and on October 9 of that year, when she was 18, she was married at Abbeville, France, to Louis XII, then 52 years old and in poor health. Her husband died on Jan. 1, 1515, and forthwith she contracted a secret marriage with Charles Brandon, 1st duke of Suffolk, who had been for long the man of her choice. Henry VIII was persuaded by Cardinal Wolsey to pardon Suffolk for marrying his sister without royal permission. In 1520 she accompanied the duke to the Field of the Cloth of Gold (q.v.); but she refused to accompany Anne Boleyn, her sister-in-law, in 1532 to a meeting with Francis I of France (who had, himself, planned to marry her after the death of Louis XII). Her daughter Frances married Henry Grey, 3d marquis of Dorset, and became the mother of Lady Jane Grey. Mary of France is also known as Mary of England.

MARY OF GUISE (also known as MARY OF LORRAINE), consort of James V of Scotland: b. Bar, France, Nov. 22, 1515; d. Edinburgh, Scotland, June 11, 1560. She was the eldest child of Claude, duke of Guise, and Annette of Bourbon. On Aug. 4, 1534, she was married to Louis d'Orléans; their son Francis died in 1551. Her husband died in 1537, and in June 1538 she married James V at Saint Andrews. She bore to him two sons, both of whom died in 1541, and a daugh-

ter, Mary, born on Dec. 8, 1542, six days before the death of James V. During the minority of Mary, Queen of Scots, the regency was exercised by James Hamilton, 2d earl of Arran, until 1554, when Mary of Guise became regent on behalf of her daughter. She would not countenance a proposed marriage between Mary, Queen of Scots and Edward VI of England, and sent the young monarch to the French court to be brought up by her relatives. With the aid of French troops she pursued a policy of hostility toward the Protestants in Scotland, whose leaders, known as the Lords of the Congregation, enlisted the help of England. A few months before her death she was compelled to take refuge in Edinburgh castle, which had a neutral status

MARY OF HUNGARY, consort of Louis II of Hungary: b. 1505; d. 1558. She was the daughter of Philip I of Spain and Juana, daughter of Ferdinand V and Isabella, and the sister of Holy Roman emperors Charles V and Ferdinand I. On Jan. 13, 1522, she was married to Louis II, king of Hungary and Bohemia. Her husband died in 1526, and from 1530, under the direction of Emperor Charles V, she was an able administrator of the Netherlands.

MARY OF MAGDALA. See MARY MAGDALENE.

MARY OF MODENA. See MARY, consort of James II of Great Britain.

MARY OF THE INCARNATION, French Ursuline nun and educator in Canada: b. Tours, France, 1599; d. Quebec, 1672. Her maiden name was Guyard. At the age of 18 she was married to a man named Martin; he died within a year, leaving her with an infant son. She entered the Ursuline order in Tours, and subsequently accompanied Mme. de la Peltrie, a church benefactress, to Canada. In 1639 she was appointed superior of the Ursuline convent opened at Quebec. She aided in the work of French missionaries in Canada.

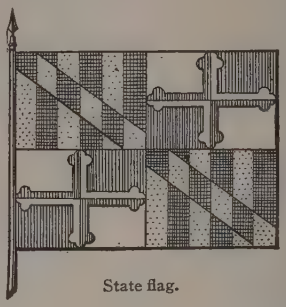
MARY STUART. See MARY (QUEEN OF SCOTS).

MARY TUDOR. See MARY I, queen of England; MARY OF FRANCE, consort of Louis XII of France.

MARYBOROUGH, mâr'ĭ-bŭ-rŭ, name of two towns in Australia. (1) In southeast Queensland, on the Mary River, 135 miles north of Brisbane, about 20 miles from the coast. It is a railroad and coal-mining center, the town containing railroad shops and foundries. Besides coal, there is a considerable trade in livestock, lumber, grains, and sugar. The seaport for Maryborough is at Urangan, 29 miles to the northeast. Pop. (1949 est.) 15,500. (2) Municipality, in the central part of Victoria, in Talbot County, 85 miles northwest of Melbourne. Gold mining is carried on in the vicinity. It is a rail and commercial center for an agricultural area. There are also flour and knitting mills, and dairy plants. Pop. (1949) 6,510.

MARYBOROUGH or **PORT LAOIGHISE,** lā'ĭ-shĕ, Ireland, county town of Laoighis or Leix (formerly Queen's County), on the Triogue River 51 miles by rail southwest of Dublin. There is a considerable trade in agricultural produce. The town's charter dates from 1570. Some portions of an ancient castle still remain. Pop. (1947) 6,198.

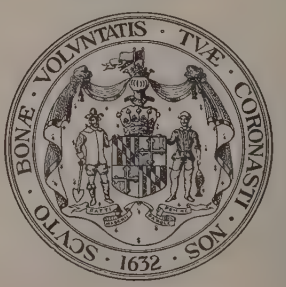
MARYLAND, mĕr'ĭ-lănd, one of the original 13 states of the United States. It is bounded on the north by Pennsylvania and Delaware, on the east by Delaware and the Atlantic Ocean, on the south by Virginia and West Virginia, and on the west by West Virginia. Maryland was named in honor of Queen Henrietta Maria, wife of King Charles I of England.



State flag.

Land area	9,881 square miles
Water area	696 square miles
Total area	10,577 square miles
Latitude	37°53′—39°43′ N.
Longitude	75°4′—79°33′ W.
Altitude	sea level to 3,340 feet
Population (1950)	2,343,001
Capital city—Annapolis; pop. (1950)	10,047
Ratified the Constitution	April 28, 1788
Bird	Baltimore oriole, designated 1947
Flower	Black-eyed Susan, adopted April 18, 1918
Motto—*Scuto Bonae Voluntatis Tuae Coronasti Nos* (With the Shield of Thy Goodwill Thou Hast Covered Us)	
Nicknames	Old Line State; Free State
Song	*Maryland, My Maryland*
Tree	No official tree

State seal: obverse.



State seal: reverse.

◉ County Seat

Physical Characteristics. — *Topography.* — The state is divided by Chesapeake Bay into two parts, the Eastern Shore and the Maryland Main or western shore. There are three principal physiographic regions: the coastal plain, the piedmont plateau, and the Appalachian region. The coastal plain encompasses the entire Eastern Shore and the western shore as far inland as the fall line. The fall line may be represented by a line drawn from Washington through Baltimore and Elkton. Between this line and the Blue Ridge Mountains to the westward lies the piedmont plateau. This region, as well as most of the coastal plain, is composed of rich farm lands. The Appalachian region, particularly Allegany and Garrett counties, is rough terrain and not well adapted to agriculture. The highest point in the state is Great Backbone Mountain in Garrett County.

Maryland's geological foundations present a wide spread. The state is part of one of the longest exposed areas of the earth's surface. Tertiary formations predominate on the Eastern Shore, Mesozoic and Tertiary on the western shore coastal plain. In the lower piedmont, crystalline rocks of igneous origin prevail; further west Paleozoic rocks are most frequently found. The Blue Ridge is composed largely of Cambrian and Lower Silurian deposits. The main rocks of the Appalachian chain are of Upper Silurian and Devonian formation. Soils on the Eastern Shore are light loam. On the western shore, sandy loam prevails. Western Maryland soils are derived principally from limestone and sandstone.

Rivers.—Both shores of Chesapeake Bay are broken by rivers which are in reality tidal estuaries. The entire course of the Potomac River, except for that portion in the District of Columbia, is in Maryland. The Susquehanna River enters the head of Chesapeake Bay. Eastern Shore rivers are the Elk, the Sassafras, the Chester, the Choptank, the Nanticoke, the Wicomico, and the Pocomoke. Maryland Main rivers emptying into the bay are the Gunpowder, the Patapsco, the Magothy, the South, the Patuxent, and the Potomac. Tributary from Maryland to the Potomac are the Monocacy, Great Pipe Creek, the Antietam, and the Conococheague. The Youghiogheny alone, a tributary of the Monongahela, drains away from the Atlantic.

Climate.—The mean monthly temperature for Maryland varies from 34°F. for January to 75° for July. The annual mean is 48°F. for the west, 57° for the south, and 54° for the state as a whole. Zero temperatures are rare. The state's mildest climate is found in Worcester, the only county facing upon the Atlantic Ocean; and the most rigorous winter climate comes to Garrett, the westernmost county. Average annual rainfall varies from 25 to 55 inches, with most parts of the state receiving 38 inches or more. Average annual snowfall is 66 inches at Oakland and 16 inches in Easton.

Political Divisions.—*Cities and Counties.*—Baltimore City is the center of Maryland's culture and economy. It is an old city, built largely without plan, and too absorbed with its thriving industry to give adequate attention to its civic and physical needs. It is picturesque and, in many ways, unique. Characteristic are the highly-scrubbed white stone steps of the countless row houses. Baltimore Street has been called the "character" street, and Charles the "quality" street. Mount Vernon Place, a small park in the middle of Charles Street leading up to the Washington Monument, is as well designed a bit of town planning as one may find. The Washington Monument is a towering monolith with a stairway inside and a gallery at the top. The city is a mecca for those interested in the arts. Early in the last century it rivaled New York as a theatrical center. Today the music department of Peabody Institute, known as the Conservatory, is the center of most musical activity. The Walters Art Gallery, donated to the city in 1931 is one of the best of its kind. The city, as well as the whole state, is noted for its good cookery. Oliver Wendell Holmes dubbed it "the gastronomic metropolis of the Union." The city's metropolitan character is in the clearest evidence when one sees its harbor. Here one has little doubt that he is visiting a great industrial city.

The seat of Baltimore County is Towson, an unincorporated suburb of Baltimore City. There is an intense county consciousness throughout Maryland. Near Baltimore the towns are suburban in composition, but many of them are distinctive. Ellicott City, built in a narrow valley, reminds one of a European city. Away from Baltimore and Washington, most of the villages are quaint and quiet. The state's second city is Cumberland, the seat of Allegany County. It is built on the mountains where they are divided by the Potomac. The city's economy is sustained by lumber, coal, and the surrounding regions of Maryland, West Virginia, and Pennsylvania. Hagerstown, the seat of Washington County and the third city in size, was laid out by Jonathan Hager in 1762. It is in a fertile farming area and contains numerous industries. Near Hagerstown is Antietam Battle Ground National Park. Also in Washington County is the place where the Potomac and the Mason-Dixon Line almost meet, leaving the state scarcely two miles wide. Frederick and Montgomery counties in central Maryland contain rich farm lands. The town of Frederick boasts the Barbara Fritchie House and the home of Roger Brooke Taney. Thomas Johnson, the first governor of Maryland, lived in Frederick.

Prince Georges and Montgomery counties border upon the District of Columbia. The existence of the federal district has greatly stimulated the surrounding areas in Maryland. The towns of Cheverly, Bladensburg, Hyattsville, Riverdale, College Park, Mount Rainier, Takoma Park, Silver Spring, Bethesda, and others are clearly a part of the metropolitan community. Many federal institutions, such as the Naval Academy at Annapolis, the model housing community at Greenbelt, and the Navy Hospital at Bethesda, have contributed marked impetus to economic life. Southern Maryland, south from Annapolis and away from the Washington-Baltimore strip development, is the least changed part of the state. The people are almost exclusively English in origin, and there is a strong element of old aristocracy. Annapolis, the capital, is one of the most individual small towns in America. Its population, according to one observer, is composed of five parts: state politics, navy, county, St. John's College, and plain townspeople.

The Eastern Shore is a place apart. Its people are vigorous, unbeholden, and keenly conscious of politics. Its economic expansion began when the refrigerator car became practical, and has continued steadily. Salisbury is the principal city and distributing point: it is the region's true

economic center. Worcester is the ocean county. Ocean City, Maryland's seaside resort, is patronized principally by Marylanders. Cambridge, on the Choptank, is the shore's second city; sizable packing and processing industries are maintained there. Crisfield lays its claim as the "Seafood Capital of the World." Smith Islanders, who inhabit a group of islands off the coast from Crisfield, are individualists par excellence. Elkton, near the head of the bay, was formerly known as a place to marry in haste; legislation enacted in 1938, however, requires a notice of 48 hours. The Eastern Shore is connected to the Maryland Main by ferries to Baltimore and Annapolis See back of state map for population of cities and towns.

Maryland architecture has been conservative. The formal Georgian influence is clearly evident. The ground rent system and other factors have led to the building of numerous row houses in Baltimore and to a lesser extent in other Maryland cities. Throughout the state there are many beautiful old houses. One of the best examples of architecture of the period of George III is the Hammond-Harwood house in Annapolis. Another famous old Annapolis house is the Chase Home, built by Samuel Chase in 1769. Doughoregan Manor in Howard County was built by Charles Carroll of Carrollton. A charming piece of architecture is Homewood on the Johns Hopkins campus in Baltimore; it was built by Charles Carroll of Carrollton for his son in 1800. Not far from Easton is Wye House, the leading old house on the Eastern Shore. At Wye Mills in Talbot County is the Wye Oak, estimated to be four hundred years old. Not far way is Wye Chapel, consecrated in 1721. Many other old houses have been preserved on the Eastern Shore and in southern Maryland.

The state's 23 counties and their county seats are as follows:

County	County Seat
Allegany	Cumberland
Anne Arundel	Annapolis
Baltimore	Towson
Baltimore City	
Calvert	Prince Frederick
Caroline	Denton
Carroll	Westminster
Cecil	Elkton
Charles	La Plata
Dorchester	Cambridge
Frederick	Frederick
Garrett	Oakland
Harford	Bel Air
Howard	Ellicott City
Kent	Chestertown
Montgomery	Rockville
Prince Georges	Upper Marlboro
Queen Annes	Centerville
St. Marys	Leonardtown
Somerset	Princess Anne
Talbot	Easton
Washington	Hagerstown
Wicomico	Salisbury
Worcester	Snow Hill

The People.—Only six states in 1950 had a denser population than Maryland. In 1940, 83.4 per cent of the state's population was white and 16.6 per cent was Negro. The percentage of other races was negligible. Native born Americans constituted nearly 96 per cent of the state's population. Most of the foreign-born lived in Baltimore City and Baltimore County. Of all native Marylanders living in the United States in 1940, 20.4 per cent were living in other states; on the other hand, 25.1 per cent of the residents of Maryland were born in other states. Maryland population continues to grow; in the 1920's it increased by 12.5 per cent, in the 1930's by 11.1 per cent, and in the 1940's by 521,757 inhabitants (28.6 per cent) to a total of 2,343,001. The percentage of urban residents in 1950 was 69 and of rural residents, 31.

It is difficult to characterize the people of a state in a nation with a population as fluid as that of America. And yet the Marylander feels the distinction. Perhaps Hulbert Footner in his book *Maryland Main and the Eastern Shore,* was right in ascribing this individuality to toleration and tobacco—toleration is traditional in Maryland and pipe smokers are a mellow sort of men. Pride in the state's history, its old houses, and its traditions is everywhere apparent. The spirit of localism is a moving force in Maryland. It is not without significance that Maryland's nickname "Free State," originating in the 1920's, has become widely used.

The pattern of Maryland culture clearly was set by the English. Besides those of English ancestry, the largest group of Maryland citizens is the Negroes. Slavery was a flourishing institution in early Maryland, but its incidence diminished after tobacco ceased to be a profitable crop. The leading Maryland abolitionist was William Lloyd Garrison, who published the paper, *The Genius of Universal Emancipation,* in Baltimore in 1829. Segregation of Negroes is not so general in Maryland as in other places. There is no segregation in transportation. Separate schools are maintained for Negroes. Segregation is effected by custom in housing, restaurants, hotels and theaters. Negroes play little part in Maryland politics. The proportion of Negroes to total Maryland population is now considerably smaller than it was at the time of the first federal census. Other national stocks which have served as a base for present-day Maryland are the Irish and Germans. The Irish settled principally north and east of Baltimore. Although Germans came from the earliest days, the greatest numbers arrived in the first half of the 19th century. German immigration, especially to Baltimore and central Maryland, had a marked effect. Indeed, the constitution of Maryland, until amended in 1944, provided for the advertisement of proposed constitutional amendments in a German-language newspaper in Baltimore. Other nationalities which have contributed in lesser measure to Maryland are French, Polish, Czech, Italian, Russian, and Lithuanian.

Religion.—Although there has been religious toleration in Maryland from the beginning, there have been several developments affecting it. The earliest settlers were Catholics, but toleration for all Christians was the rule. Catholicism was outlawed briefly under the Puritan regime. The Church of England was established in 1692, and supported by a poll tax; the established church was continued until 1776, although other religions were tolerated. It was during this period that legislation was passed requiring the marriage ceremony to be religious; this requirement continues today (1948). Official religious intolerance finally was dealt its death blow in 1825, when the oath of public office was amended to permit Jews to hold office. The Catholic Church has been strong from the earliest days. The Right Reverend John Carroll was consecrated as bishop of Baltimore in 1789, and his see was raised to an archbishopric in 1808. He was the first prelate to hold episcopal office in the Roman Catholic

hurch in the United States. Maryland church emberships, according to the religious census of 936, are in some respects unique. Catholics held 5.2 per cent of the state's church memberships, compared with a national average of 35.7 per nt. In Baltimore City, 52.3 per cent of the urch memberships were Catholic, and in the nall county of St. Marys 87 per cent belonged to at church. The Methodist Episcopal Church as second largest in memberships. The first ethodist services held in the United States were nducted by Robert Strawbridge in Carroll unty in 1761. In 1936, 17.3 per cent of Maryand church memberships were held in the various anches of this church. The Lutheran Church likewise strong in Maryland. The German-eaking settlers of the middle 18th century ought this church to the state. In 1936, 75 per nt of all Maryland Lutheran church member-ips were held in Frederick and Washington unties and Baltimore City. Quite numerous so are Protestant Episcopal church member-ips. The Right Reverend Samuel Claggett was nsecrated in 1789 as bishop of Maryland, the st Protestant Episcopal bishop in the United ates. The preponderance of Jewish church mberships are held in Baltimore City and ltimore County. Other sizeable church mem-rships in 1936 (latest official census) were held the Presbyterian, Southern Baptist, Evangeli-, and Reformed, and Negro Baptist churches. mberships in the latter were concentrated in ltimore City.

Famous Men and Women.—Thomas Stone harles County, 1743–1787), Samuel Chase omerset County, 1741–1811), William Paca ear Abingdon, 1740–1799), and Charles Carroll Carrollton (Annapolis, 1737–1832), were all ners of the Declaration of Independence. miel of St. Thomas Jenifer (Charles County, 3–1790) was a pre-Revolutionary leader and ner of the Constitution of the United States in 7. A few of the native Marylanders who de names for themselves in the United States vernment are: Roger Brooke Taney (Calvert unty, 1777–1864), United States attorney gen-l and chief justice of the United States Su-me Court; William Pinkney (Annapolis, 1764–2), lawyer, statesman, and diplomat; Reverdy nson (Annapolis, 1796–1876), constitutional wyer and diplomat; Charles Joseph Bonaparte altimore, 1851–1921), lawyer, United States orney general; and William Wirt (Bladens-g, 1772–1834), lawyer, United States attorney neral, and also author of the best seller, *The ters of a British Spy.*

Among the state's better known authors may found: Henry Louis Mencken (Baltimore, 0–), editor and satirist, modern Maryland's st important literary figure; Francis Scott Key rederick County, now Carroll County, 1779–3), lawyer, and author of *The Star-Spangled ner;* Mason Locke Weems (Anne Arundel unty, 1759–1825), clergyman and author, often ed Parson Weems; John Leeds Bozman (Tal-County, 1757–1823), historian and lawyer; n Pendleton Kennedy (Baltimore, 1795–1870), elist; Lizette Woodworth Reese (Baltimore unty, 1856–1935), author of autobiographical ks and volumes of poetry; Upton Beall Sin-r (Baltimore, 1878–), writer and politician, rded Pulitzer Prize in 1943 for *Dragon's th;* James Mallahan Cain (Annapolis, 2–), journalist, author of *The Postman Always Rings Twice;* Charles Fulton Oursler (Baltimore, 1893–1952), journalist, playwright, and fiction writer; Frederick Arnold Kummer (Catonsville, 1873–1943), writer of fiction and plays; Ryder Randall (Baltimore, 1839–1908), journalist and song writer, author of *Maryland, My Maryland.*

A few native Marylanders in the field of art are: Charles Willson Peale (Queen Annes County, 1741–1827), portrait painter; James Peale (Chestertown, 1749–1831), miniaturist; Raphael Peale (Annapolis, 1774–1825), miniaturist and painter of still life; Charles Yardley Turner (Baltimore, 1850–1918), outstanding muralist; Camelia Whitehurst (Baltimore, 1875–1936), known for her portraits of children; R. McGill Mackall (Baltimore, 1889–), muralist and portrait painter; and William Henry Rinehart (near Union Bridge, 1825–1874), sculptor.

Several of the leading figures in American Negro history were natives of Maryland. Benjamin Banneker (1736–1806), mathematician, published an almanac in 1792 and became known in Europe as an astronomer. Frederick Douglass (1817?–1895), born a slave on an Eastern Shore plantation, became an abolitionist, orator, journalist, and served as minister to Haiti. Harriet Tubman (1821?–1913) was a fugitive slave, abolitionist, and the foremost leader of the Underground Railroad. Francis E. Watkins Harper (1825–1911) was born of free parents in Baltimore. She was well known as a poet, novelist, lecturer, and abolitionist leader.

Natural Resources.—*Flora.*—Wild flowers most frequently found are clematis, honeysuckle, Virginia creeper, trailing arbutus, violets, wild roses, mountain laurel, clover, black-eyed Susan, golden aster, and goldenrod. There is very little virgin timber. Black and white oak and beech are sometimes found in pure stands, but more often in mixed forest. Other trees are poplar, locust, hickory, ash, gum, elm, hackberry, persimmon, pine, spruce, and hemlock.

Fauna.—Most large mammals have disappeared, although there are perhaps some bobcats and bear in the mountains. Deer, foxes, opossums, raccoons, squirrels, and rabbits are found in various places in the state. The seventeen-year locust and the Japanese beetle are the most destructive insects. The only poisonous snakes in Maryland are the timber rattler and the copperhead. The diamondback terrapin is plentiful on the Eastern Shore. Water and shore birds are abundant in the Chesapeake Bay region and many kinds of ducks frequent the state's waters. The Chesapeake Bay retriever, used for hunting waterfowl, is a native Maryland breed. Bald eagles, hawks, herons, and owls are frequently found. The principal song birds are the orioles, thrushes, finches, warblers, and whippoorwills.

Minerals.—See section under *Production and Manufactures.*

Parks, Forests, and Refuges.—*Parks.*—Fort McHenry National Monument, with an area of 47 acres, was made a national park in 1925. The Francis Scott Key Monument, near the Fort Avenue entrance to the park, commemorates the birthplace of the *Star-Spangled Banner.* The Antietam National Battlefield and cemetery, with an area of about 183 acres, commemorate one of the most sanguinary one-day battles of the Civil War (Sept. 17, 1862). The Catoctin Recreational Area contains approximately 12,000 acres and is a project of the federal government

The state parks include Fort Frederick (188 acres), erected in 1756 for defense against the French and Indians; Patapsco State Park (1,116 acres), wooded hills and a favorite camping spot; and the Washington Monument State Park (32 acres), which contains a copy of an earlier monument built in 1827 and used as a Union signal station.

Forests.—There are no national forests in Maryland, but there are state forests. Their names and acreage are: Cedarville, 3,510; Elk Neck, 3,762; Green Ridge, 22,016; Pocomoke, 1,732; Potomac, 10,564; Savage River, 17,825; and Swallow Falls, 5,905.

Refuges and Fish Hatcheries.—The Bear Creek Fish Hatchery is run by the state conservation department and stocks Maryland streams with brook and rainbow trout. The largest fish hatchery in Maryland is the one located at Lewistown. The Patuxent Wildlife Research Refuge is administered by the United States Fish and Wildlife Service and covers about 2,623 acres. Established by the federal government in 1931, Blackwater Migratory Bird Refuge contains approximately 10,500 acres of marsh situated on the Big and Little Blackwater rivers. Quail are raised at the Wicomico State Game Farm.

Production and Manufactures.—*Agriculture.*—There were in 1940, 42,110 farms in Maryland. Of these, 10,994, or 26.1 per cent, were operated by tenants, and the rest by full owners, part owners, or managers. The average size of the 1940 Maryland farm was 99.7 acres, somewhat smaller than that of thirty years before. The value of the average Maryland farm was $6,506 in 1940 as compared with $4,941 in 1910. The staple crop in colonial Maryland was tobacco. Shortly after the Civil War, it declined in relative importance, and now is grown almost exclusively in southern Maryland. The leading acreage in farm plantings for many years has been in corn, although the number of acres declined steadily in the decades before 1940. The second largest acreage is devoted to wheat. Next comes hay, as might be expected in the dairy farm region surrounding large cities. Oats, barley, and rye are also extensively planted in the state. In the vegetable crops, the largest acreage is planted in tomatoes. Next in order of acreage planted in 1939 came sweet corn, Irish potatoes, beans, sweet potatoes, peas, canteloupe, watermelons, cucumbers, and spinach. The acreage planted in Irish potatoes declined considerably in the three decades preceding 1940. The same is true of cherries and grapes, while the production of apples and peaches steadily increased. Large quantities of strawberries are raised in the Chesapeake Bay region. There had been a decline since 1910 in the number of horses and sheep raised in Maryland, while the number of cattle and chickens had grown. Wool production was reduced by more than half in the three decades before 1940, whereas the production of milk and eggs increased rapidly.

Practically all areas of Maryland are well adapted to farming except the swamp areas of Dorchester County and the mountains of western Maryland. Frederick County (as of 1947) produces more wheat, hay, milk, and livestock. Carroll County leads in corn and poultry. The Eastern Shore concentrates on truck farming and canning. Somerset County raises more strawberries, and Somerset and Worcester produce most of the state's Irish potatoes. Wicomico County raises more sweet potatoes than any other county. Dairy farming is the principal agricultural pursuit in Baltimore, Harford, and Montgomery counties. In general, agriculture in Maryland is profitable. Land is fertile, huge markets are near, and both rail and water transportation are easily accessible. All state agriculture agencies are concentrated at the University of Maryland The university's Board of Regents serves also as the state board of agriculture. The agricultural experiment station operated by the United States Department of Agriculture at Beltsville is one of the largest of its kind.

Fisheries.—Seafood is a thriving business in Maryland. Principal fish caught in the bay are shad, menhaden, croakers, sturgeon, and sea trout. Shellfish are oysters, crabs, and clams, ranging in supply in the order named. State conservation officials have been concerned with supply and artificial culture, particularly of oysters.

Forests and Forest Products.—There is practically no virgin timber left in Maryland. Lumber and lumber products have definitely contributed much toward the development of the state's economy. There are some hardwoods in Maryland, particularly oak. Chestnut and walnut have almost disappeared.

Minerals.—Maryland is not a leading state in mineral production. In 1939 Maryland ranked thirty-third among the states in the value of mineral industry products. The leading products were coal and sand and gravel, constituting between them 75 per cent of the value of the total product. Other minerals produced were limestone, granite, basalt, sandstone, slate, marble, kaolin, clay, shale, and asbestos. Of the 142 active mining concerns in the state, 59 were in Allegany County and 25 were in Garrett County. These two counties contain the Maryland coal deposits. Most Maryland coal miners are of native American stock, and there are few typical mining camps. Large mineral industries are located in Baltimore, particularly steel mills and copper smelting and rolling; most of the minerals processed, however, are shipped in from outside the state.

Manufactures.—By far the greater portion of Maryland's manufacturing industry is located in Baltimore. There is extensive vegetable canning and processing on the Eastern Shore. Cumberland has a large Celanese plant and a tire factory. In Hagerstown there is an aircraft plant and a sizable machine tool industry. It is in Baltimore that nearly 90 per cent of the state's manufacturing is concentrated. The city's industries, already thriving, received tremendous impetus from the two world wars. Almost every kind of manufacturing has come to Baltimore. The Baltimore establishments of the American Smelting and Refining Company (copper), the Bethlehem Steel Company, and the Glenn L. Martin aircraft enterprises are among the largest of their kind. Shipbuilding, one of the state's earliest industries, still is thriving. Large factories are devoted to oil refining, spice manufacture, sugar refining, meat packing, and canning. Clothing made in Baltimore is sold throughout the nation. A large distillery and a large Western Electric plant are located near the city's outskirts. Other products are chemicals, fertilizer, machinery and machine tools, and printing. As in any other thriving metropolis, building and construction concerns employ more persons than does any other branch of industry. In addition to its tremendous factory

product, the city ranks high in the nation as a wholesale and retail mart.

Transportation.—Two factors have largely shaped the development of Maryland's transportation system. First is the existence of Chesapeake Bay, which has made available cheap water transportation. Second is the fact that the main line of rail traffic southward from New York transverses the state. Both the Baltimore and Ohio and the Pennsylvania railroads operate main lines from New York to Washington, by way of Baltimore. The Baltimore and Ohio also swings westward to serve western Maryland. The Western Maryland Railway also serves that section. The Pennsylvania operates down the Eastern Shore. There are many bus lines serving all parts of the state, with all lines converging in Baltimore and Washington. The main airlines serving the state at Washington and Baltimore are Pennsylvania-Central, Eastern, and American. At Baltimore, ships can come farther inland than at any other port on the eastern seaboard. Baltimore is the second leading port in the United States. There are ferries plying across the bay, and regular steamboat connections are maintained with Wilmington, Philadelphia, and other ports. The port of Baltimore has some 350 wharves and piers.

Economic and Financial Factors.—*Banks.*—As of June 30, 1947, there were 106 state banks and trust companies. The total assets of these banks were $916,050,309.79 and the total deposits, $845,674,692.05. At the same time there were 9 mutual savings banks in operation. Their total assets were $436,173,535.81 and total deposits, $391,873,195.00. As of Dec. 31, 1946, there was a total of 63 national banks, with total assets of $753,889,000 and total deposits of $703,772,000.

Finances.—Following is a statement of finances for the fiscal year 1946–47:

Balance in state treasury, beginning of fiscal year 1946–47	$ 33,998,718.47
Receipts, all sources, 1946–47	93,286,760.21
Total	$127,285,478.68
Disbursements, 1946–47	96,746,063.21
Balance, beginning of fiscal year 1947–48	30,539,415.47
State indebtedness on June 30, 1947, totaled	16,895,000.00

Taxation.—Tax collection is not centralized. The principal sources of revenue are the income tax, the property tax, racing taxes, licenses, and the sales tax, effective July 1, 1947. There is no poll tax.

Government.—Maryland has been a political entity for over 300 years. Still in use is its capitol building which was built before the Revolutionary War. The present constitution, the state's fourth, dates from 1867. By its provisions, the question of a new constitutional convention is submitted to the voters each twenty years. Initiative is not used, and referendum is used only for constitutional amendments and, upon petition, for approval or nullification of any act of the General Assembly not involving an appropriation.

Executive.—The principal policy branches of the government are the governor and the General Assembly. Elections are held in even-numbered years in which there is not a presidential election. The governor is elected for four years and is indefinitely re-eligible. Governor Albert C. Ritchie served for four terms. The governor's inauguration is the second Wednesday in January following his election. There is no lieutenant governor, succession going to the president of the Senate and the speaker of the House of Delegates. The governor is assisted by an advisory council composed of the principal elected and appointed department heads. The governor's veto of legislation may be overridden by a vote of three fifths of the members elected to each house. Although the political and executive capital is Annapolis, the administrative capital is Baltimore. Practically all of the state's extensive administrative establishments are maintained in the larger city.

The following is a list of the state governors:

LORDS PROPRIETARY OF MARYLAND

Cecilius Calvert, 2d Lord Baltimore	1632–1675
Charles Calvert, 3d Lord Baltimore	1675–1715
Benedict Leonard Calvert, 4th Lord Baltimore	1715
Charles Calvert, 5th Lord Baltimore	1715–1751
Frederick Calvert, 6th Lord Baltimore	1751–1771
Henry Harford	1771–1776

PROPRIETARY GOVERNORS OF MARYLAND

Leonard Calvert	1634–1647
Thomas Greene	1647–1649
William Stone	1649–1654
Commissioners. Settlers appointed by Parliamentary Commissioners or by Provincial Court	1654–1658
Josias Fendall	1658–1660
Philip Calvert	1660–1661
Charles Calvert	1661–1676
Cecilius Calvert	1676
Thomas Notley	1676–1679
Charles, 3d Lord Baltimore	1679–1684
Benedict Leonard Calvert	1684–1688
William Joseph (president of council)	1688–1689
Protestant Associators	1689
Convention of Freemen and John Coode, Commander in chief	1689–1690
Nehemiah Blakistone	1690–1692

ROYAL GOVERNORS

Sir Lionel Copley	1692–1693
Sir Thomas Lawrence	1693
Sir Edmund Andros	1693–1694
Col. Nicholas Greenbury	1694
Sir Thomas Lawrence	1694
Francis Nicholson	1694–1699
Nathaniel Blakistone	1699–1702
Thomas Tench	1702–1704
John Seymour	1704–1709
Edward Lloyd	1709–1714
John Hart	1714–1715

PROPRIETARY GOVERNORS (RESTORED)

John Hart	1715–1720
Charles Calvert	1720–1727
Benedict Leonard Calvert	1727–1731
Samuel Ogle	1731–1732
Charles, 5th Lord Baltimore	1732–1733
Samuel Ogle	1733–1742
Thomas Bladen	1742–1747
Samuel Ogle	1747–1752
Benjamin Tasker	1752–1753
Horatio Sharpe	1753–1769
Robert Eden	1769–1776
The Convention and Council of Safety	1776–1777

STATE GOVERNORS OF MARYLAND

Thomas Johnson		1777–1779
Thomas Sim Lee		1779–1782
William Paca		1782–1785
William Smallwood		1785–1788
John E. Howard	Federalist	1788–1791
George Plater	"	1791–1792
James Brice	"	1792
Thomas Sim Lee	"	1792–1794
John H. Stone	"	1794–1797
John Henry	"	1797–1798
Benjamin Ogle	"	1798–1801
John F. Mercer	Republican	1801–1803
Robert Bowie	"	1803–1806
Robert Wright	"	1806–1809
Edward Lloyd	"	1809–1811
Robert Bowie	"	1811–1812
Levin Winder	Federalist	1812–1815
Charles Ridgely of Hampton	"	1815–1818
Charles Goldsborough	"	1818–1819
Samuel Sprigg	Republican	1819–1822
Samuel Stevens, Jr.	"	1822–1825
Joseph Kent	"	1825–1828
Daniel Martin	Anti-Jackson	1828–1829
Thomas K. Carroll	Jackson-Democrat	1829–1830
Daniel Martin	Anti-Jackson	1830–1831

George Howard	Whig	1831–1833
James Thomas	"	1833–1835
Thomas W. Veazey	"	1835–1838
William Grayson	Democrat	1838–1841
Francis Thomas	"	1841–1844
Thomas G. Pratt	Whig	1844–1847
Philip Francis Thomas	Democrat	1847–1850
Enoch Louis Lowe	"	1850–1853

Legislature.—The General Assembly meets on the first Wednesday in January of odd-numbered years. Members of both houses serve for four years. There is one senator from each of the 23 counties and from each of the six legislative districts in Baltimore City, a total of 29. The House of Delegates is composed of six delegates from each of the Baltimore City districts and of two to six delegates from each county, a total of 123. The chambers are equal in power, and the governor, especially when he is a Democrat, exercises a substantial leadership in legislative matters. The General Assembly is assisted by the department of legislative reference. It is at the service of the governor, any committee or member of the General Assembly, or the head of any state department. Its regular establishment is in the City Hall at Baltimore, where it serves the city as well as the state. During legislative sessions it maintains an office in Annapolis to be available for bill drafting. The director of the department is secretary of the legislative council. The legislative council is composed of ten senators and ten delegates who function between sessions of the legislature to study and recommend new legislation. The council's recommendations carry great weight in the assembly, frequently even on controversial issues.

The comptroller and the attorney general are popularly elected. The treasurer is chosen by the General Assembly. Other state administrative officials are appointed. Although there was substantial administrative reorganization under Governor Ritchie in 1922, boards and commissions are still more numerous than is the case in most other states. The state service operates under a merit system of long standing and universal acceptance. There is also an active state planning commission. Budgeting and central purchasing are performed by the department of budget and procurement.

Public Health and Welfare.—Programs in the fields of health and welfare are operated by the state in the counties. Unemployment and industrial accident insurance programs are well devised. Eleemosynary and correctional institutions are concentrated principally in the piedmont and western shore areas.

Courts.—The administration of justice is performed in the 23 counties by seven circuit courts. At the same level in Baltimore City is the supreme bench of 11 judges. There are four appellate circuit courts, one of which serves Baltimore City alone, and the high court, the court of appeals at Annapolis. Judges are elected for long terms.

Elections.—The state is usually (1947) Democratic rather than Republican. There have been only two Republican governors of Maryland since 1900, and these for single terms. Two counties, Allegany and Garrett, are nearly always Republican. There is usually also a strong Republican vote in Anne Arundel, Baltimore, Carroll, Frederick, Montgomery, Somerset, and Washington counties. Although it does occasionally elect a Republican mayor, Baltimore City is predominantly democratic. In President Franklin D. Roosevelt's last campaign, sixteen of the state's twenty-three counties went Republican. Of the large counties, only Prince Georges went Democratic. And yet the large Democratic majority in Baltimore City carried the state comfortably for Roosevelt. Of the state's six congressmen, seldom more than one is Republican. Both houses of the legislature are traditionally Democratic, although the Republican minority is usually large enough to make itself felt. Republican governors find it difficult to accomplish a full measure of legislative leadership. Party candidates are nominated in primaries, with run-off primaries in the absence of a majority. Voting machines are used in Baltimore City.

Local.—Local government is extensively controlled by the state. Baltimore City, which is not in a county, has the right to draw its own charter, but its logical governmental preserve is frequently invaded by special legislation. Although counties may by an elaborate process draft home rule charters, only Montgomery and Wicomico have moved in this direction. County government is the usual traditional commission system, except for Anne Arundel, which, in 1947, was authorized to employ a manager. Cities as well as counties depend upon the assembly for grants of authority. Greenbelt, the model town, has a manager. Cumberland and a few other smaller towns have the commission form of government. All others have mayor-council systems. Special governmental districts are necessary in the metropolitan areas of Baltimore and Washington (part of which lies in Maryland). Legislation enacted in 1947 definitely started the state along the path of sharing taxes with counties and cities. With numerous special exceptions, local government debt is limited by law to a proportion of assessed property valuations.

Education. — *Public and Private.* — During early colonial years there were no schools in Maryland. In 1694 duties were levied on selected commodities to support free schools. King William School was established at Annapolis in 1696. In 1723 the assembly provided for a grammar school in each county. These were the only state-supported schools until well after 1800. Religious schools, particularly Catholic, were quite numerous from early years. Public schools were organized for Baltimore in 1829. A uniform public school system was provided for the whole state in the constitution of 1864. A compulsory school attendance law was enacted in 1911. Schools are now (1947) administered on a county-wide basis, with state aid forthcoming to maintain a minimum program in each county. The governor appoints county school boards, which in turn select and control the county superintendents.

Baltimore City schools are controlled by a board of school commissioners, which is appointed by the mayor. The state department of education supervises the elementary and secondary schools in the 23 counties and the state teachers colleges at Towson, Frostburg, and Salisbury for white students and at Bowie for Negroes. Baltimore City operates the Coppin Teachers College for Negroes. Negro schools are maintained separately.

There are several well-known private secondary schools in Maryland. Some of the boys' schools are the McDonough School, West Nottingham Academy, the Gilman County School and the Boys' Latin School. Some of the girls' schools are Hannah Moore Academy, Notre Dame Preparatory School, Bryn Mawr School, Girls' Latin School, Mount Saint Agnes, Roberts-Beach, St. Timothy's, Greenwood, and Garrison Forest School. Most of these schools are in and around Baltimore.

The Maryland School for the Blind is maintained in the outskirts of Baltimore. The school for the colored deaf and blind is located on the same premises. The Maryland School for the Deaf is located in Frederick.

The first Maryland institution of higher learning, Washington College at Chestertown, was established in 1782 and is still in operation. It was the first college named for George Washington. It granted him the honorary degree of Doctor of laws, and another was granted to Franklin D. Roosevelt in 1933. St. John's College at Annapolis, which combined with the older King William School, was chartered in 1784. This college undertook in 1937 a revolutionary curriculum based upon the world's great books. It is for men only and is nonsectarian. George Washington Parke Custis, Francis Scott Key, and Reverdy Johnson are among its distinguished alumni. There are four Roman Catholic colleges in Maryland: in Baltimore are Loyola (1852) and College of Notre Dame of Maryland (1896); and in Emmitsburg are Mount St. Mary's (1808) and St. Joseph's (1909). Western Maryland College was established at Westminster in 1868. In Baltimore is Goucher College for girls, established by the Methodists as the Woman's College of Baltimore in 1886. It later became nonsectarian.

By far the most distinguished of the private institutions in Maryland is the Johns Hopkins University in Baltimore. It was incorporated in 1867, after being endowed with a bequest of $3,500,000 by the man whose name it bears. Upon his death in 1873, Hopkins left the university and the hospital an additonal $7,000,000. The university has been outstanding in many fields, particularly science, history, political science, and medicine. The medical school has, along with the University of Maryland Medical School, made of Baltimore one of the country's medical meccas. The publication of philosophical studies has brought great renown to Johns Hopkins. Woodrow Wilson was one of its early fellows. The undergraduate college has never been large. The engineering school receives its major support from state appropriations. In exchange, the university gives free scholarships to a certain number of Maryland students. Other schools which grant scholarships in exchange for state appropriations are St. Johns, Washington, and Western Maryland, mentioned previously, and Charlotte Hall School and St. Mary's Female Seminary, both in St. Marys County. The University of Maryland derives from two sources: the University of Maryland, established in 1812, comprising principally the school of medicine which served as a nucleus for the other professional schools arising later, and Maryland Agricultural College at College Park, chartered in 1856 and made the land-grant college in 1862. The two branches were merged by law in 1920, with the main university at College Park and several of the professional schools still in Baltimore.

Morgan College in Baltimore was taken over by the state in 1939 and became Morgan State College. It is the state's leading Negro college. Princess Anne College at Princess Anne on the Eastern Shore is the Negro land-grant college. Whereas Morgan State College specializes in teacher-training, Princess Anne emphasizes agriculture, home economics, and the mechanic arts. The Marbury Commission for the study of Maryland higher education adjudged Morgan State College in 1947 to be the most nearly adequate of the Negro schools.

Following World War II, several junior colleges arose in the state. Some of these are Montgomery Junior College at Chevy Chase, Hagerstown Junior College, and Baltimore Junior College. These colleges were organized principally as night schools and made use of high school facilities already available.

Literacy.—According to the census of 1940, of the 1,054,688 persons 25 years old and over, 29,702 did not complete any school years. There were 325,893 persons who had completed grammar school, 122,497 who had completed high school, and 50,371 who had completed four years of college or more. The average school years completed was eight. The percentage of persons 25 years old and over finishing less than five years of school was 15.3.

Libraries.—In addition to the libraries of the various educational institutions, there are extensive public libraries in Maryland. Chief among these is the Enoch Pratt Free Public Library, established in 1882 with a gift to Baltimore City of $1,200,000 by Enoch Pratt. It has since received large grants of Carnegie funds. It is housed in a magnificent building on Cathedral Street. The leading county library is the Washington County Free Library. Libraries have been authorized in other counties, but not all have been established. The city library in Baltimore has been merged with that of the department of legislative reference in the City Hall.

History.—The first evidence of the possibilities of colonization in Maryland derived from the reports of Capt. John Smith, who left Jamestown in 1608 to explore Chesapeake Bay. He found Indians, principally Algonquins, living in the territory which is now Maryland. The leading tribes on the Maryland Main were the Piscataway, the Nanjemoy, and the Patuxent; on the Eastern Shore were the Nanticoke. These tribes were agricultural, living in clearings and raising corn, potatoes, and tobacco. Near the head of the bay lived the Susquehannocks (Susquehanna), of the Iroquois nation. Except for occasional raids by the Seneca from the north and later troubles in western Maryland during the French and Indian War, there was never much Indian trouble in Maryland. In general, the Indian was treated well, and the Maryland tribes gradually and peaceably withdrew. After the Smith expedition,

Virginians began trading freely with the Indians in the bay region, principally in furs. William Claiborne, representing a trading company of London, established a trading post on Kent Island in 1631. Claiborne was active in Virginia politics, and for many years contested the rights of the Lords Baltimore to Maryland.

The 1st Lord Baltimore was Sir George Calvert. He retired from active politics because he had become a Roman Catholic, after having served as secretary of state for England. He was interested in establishing a colony in America, and received from the king a grant of land in Newfoundland. The rigors of the Newfoundland climate proved discouraging, and the project was abandoned. He visited Virginia and was so pleased with it that he besought from the king a grant in the same neighborhood. The territory of Maryland was granted to him in much broader terms than he was ever able to reduce to possession, partially because of conflict with the duke of York over what is now Delaware and with William Penn over the boundary line between the two colonies of Maryland and Pennsylvania. The boundaries of the colony, as stated in the grant, would have run from Watkins Point, at the head of Chesapeake Bay, due east to the Delaware River, up the river to the fortieth parallel, west along this parallel to the meridian of longitude which passed through the headwaters of the Potomac River, south along that meridian and eastward and southward along the southern bank of the Potomac to Cinquack, near the mouth of the Potomac in Virginia, thence due northward to Watkins Point. If these boundaries had been maintained, the cities of Philadelphia and Wilmington and goodly portions of their respective states would now be in Maryland. All Englishmen, under the charter, could move to Maryland and enjoy their rights as free men. The charter granted to the proprietor the right to make laws with the consent of the freemen or their delegates. He tried originally to exercise the lawmaking power in town meeting fashion; but by 1638 the assembly had assumed the power to initiate laws, and by 1650 a regular bicameral legislature was in operation exercising full legislative powers.

The 1st Lord Baltimore died before the charter could be granted, and the charter was granted to his son Cecilius Calvert, the 2d Lord Baltimore, on June 20, 1632. Although Cecilius Calvert never saw Maryland, he supervised its growth carefully until his death in 1675. Under the leadership of Leonard Calvert, the brother of Cecilius and the first governor of Maryland, the *Ark* and the *Dove* sailed from England in 1633 and landed on St. Clements Island (or Blakistone Island) in Chesapeake Bay on March 25, 1634. This date is celebrated in Maryland as *Maryland Day*. The two ships carried more than 200 persons, both Catholics and Protestants. The first settlement was made at St. Marys in southern Maryland. It became the first capital and remained so for about 60 years, when the capital was moved to Annapolis. The state's first two counties were St. Marys in southern Maryland and Kent on the Eastern Shore.

From the beginning, difficulties beset the proprietor, Cecilius Calvert. Opposition from Claiborne and his settlers on Kent Island and from Virginians, both in the colonies and in England, continued for many years. He never came to America, but in England he worked assiduously toward the goal of securing the full development of the colony. While he was a Catholic, he sought the establishment of no church and was always disposed to separate church and state. His principal aim was to provide an asylum for persons of his faith. In 1649 the assembly enacted the "Act Concerning Religion" guaranteeing religious toleration. The Puritan Revolution caused repercussions in Maryland. Several violent episodes occurred, but they were finally terminated after 1656, when Oliver Cromwell indicated his willingness for Lord Baltimore to keep the colony. The general unrest was not settled, however, until Philip Calvert arrived with a new commission as governor from King Charles II, after the Restoration. Charles Calvert, later to become 3d Lord Baltimore, served as governor from 1661 to 1675. He was the first of the proprietors to live in the colony.

Meanwhile settlements had spread. The fur trade very soon declined in importance, and agriculture took its place. Wheat and corn were important crops, but tobacco early became the staple crop and remained so long after the colonial period was past. Indentured white servants at first did most of the hard labor, but they were gradually supplanted by Negro slaves. A group of Puritans from Virginia settled on the banks of the Severn and established the town of Providence, later to become Annapolis. They named their new county Anne Arundel, after the wife of Cecilius Calvert. Calvert County was formed in 1654 and Charles County in 1658. Prior to the death of Cecilius Calvert in 1675, the Eastern Shore saw considerable development, with the establishment of Talbot, Somerset, and Dorchester counties. At the head of the bay, Cecil and Baltimore counties were also formed.

Charles Calvert, 3d Lord Baltimore, became proprietor in 1675. His troubles were quite as serious and numerous as those of his father. The most perplexing Indian disturbances occurred within his first ten years, with the Susquehannocks, Iroquois, Senecas, and Onondagas. A crown patent granted to William Penn in 1681 conflicted with the Maryland grant, precipitating what was to be a long and acrimonious boundary conflict between the two colonies. The duke of York was Penn's patron, and when he ascended the throne in 1685 as James II, Charles' difficulties were intensified. A rebellion in the colony in 1689 displaced the proprietor. Shortly thereafter the crown took over political authority, and Maryland became a crown colony; Lord Baltimore's property rights, however, were reserved to him. The first royal governor arrived in 1692. Under the royal government the town of Annapolis became the capital; laws were codified; the lower house of the assembly grew in prestige and power; and the Anglican Church was established and a poll tax of forty pounds of tobacco was levied for its support. During this period the proprietor sent as his property agent Charles Carroll, who founded one of Maryland's leading families. The royal regime lasted until 1715, when the colony was restored to the proprietor after Benedict Leonard Calvert succeeded to the title and renounced Catholicism. During the royal period two new counties, Queen Annes and Prince Georges, were created and named for the queen and her husband. About 1700 the movement toward western Maryland began. Tobacco and slavery did not spread westward. Occasional Indian troubles vexed the western settlers. By

1730 a town had been settled on the present site of Cumberland.

Benedict Leonard lived only a short while after his succession to the title. His son Charles became the 5th Lord Baltimore and the fourth lord proprietary. Although Charles' proprietorship was presumably identical to that of the first proprietors, the years of public rule had left their mark, and he came to be considered as little more than an absentee landlord. He visited the province in 1732–1733. His son Frederick served as the last proprietor from 1751–1771; he never came to Maryland. In 1723 the General Assembly authorized the establishment of a free school in each county. Catholics were disfranchised and repressed for the remaining provincial years. The town of Baltimore was settled on the Patapsco in 1729. German settlers penetrated western Maryland from Pennsylvania. Charles' visit to Maryland in 1732 was primarily to settle the perplexing Pennsylvania boundary dispute. His concessions served as a basis for the surveying of the boundary by Charles Mason and Jeremiah Dixon in the years 1762 to 1767. Maryland, throughout its history, lost heavily in boundary disputes. Worcester County on the Atlantic was organized in 1742; Frederick County was established in 1748. The conclusion of the French and Indian War marked the end of Maryland's Indian troubles. The last proprietor, Frederick, died in 1771, bequeathing the colony to his illegitimate son, Henry Harford. Harford County was named for him; Caroline County, likewise established before the American Revolution, was named for the wife of Governor Robert Eden.

Agitation for independence was as plentiful in Maryland as elsewhere in the colonies. Maryland was represented at the Stamp Act Congress. Conventions were called to protest against the Townshend Acts; after these laws were repealed, Maryland felt only mild disturbances. With the departure of Governor Eden for a brief visit to England in 1774, the informal protest organization, known as the convention and composed of five delegates from each county, began to assume the proportions of a regular government; it chose delegates to the Continental congresses and appointed a committee of safety vested with interim powers; later it enlisted troops and exercised many other governmental powers. There was considerable loyalist sentiment in conservative Maryland. The influential royal governor, Eden, fought valiantly for a losing cause. Advocates of independence centered in Baltimore and Frederick. Principal leaders were Samuel Chase, Charles Carroll of Carrollton, Samuel Tilghman, and William Paca. The Maryland Convention resolved as late as May 1776 that it was not too late to compose differences. Late in June, however, the convention authorized the Maryland delegates to vote for independence. Governor Eden left immediately for England. On July 3 the Maryland Convention declared independence and set about the preparation of a state constitution. The Maryland signers of the Declaration of Independence were Charles Carroll of Carrollton, Samuel Chase, William Paca, and Thomas Stone.

The convention met to form Maryland's first constitution on Aug. 14, 1776. The constitution was proclaimed, without submission to the voters, on Nov. 8, 1776. The new document provided a bill of rights, a governor's council, a bicameral legislature with a House of Delegates elected annually and a Senate chosen by an electoral college for five-year terms, and a governor chosen annually by the legislature. High property qualifications were established for the suffrage and even higher for office holding. The first state governor was Thomas Johnson. In 1776, Frederick County was divided into three counties: the central county retained the old name, the southern portion became Montgomery County, named for the revolutionary general, Richard Montgomery, and the western portion became Washington County. The new government of Maryland gave full support to the American Revolution. Maryland troops were commanded by Gen. William Smallwood. Other famous officers were Gen. Mordecai Gist and Col. John Eager Howard. Dr. James McHenry was one of General Washington's aides; he later became secretary of war under Presidents Washington and Adams. The bravery of Maryland troops during the revolution earned for the state its nickname, the Old Line State. Maryland refused to ratify the Articles of Confederation until those states claiming western lands agreed to cede their claims to the central government. The Continental Congress met in Annapolis in 1783 and 1784. It was there that General Washington resigned his commission on Dec. 23, 1783, and Congress ratified the treaty terminating the revolution on Jan. 15, 1784.

Maryland actively supported the move toward a constitutional convention. Commissioners from several states met at Annapolis in 1786 and agreed to meet the following year in Philadelphia. Maryland delegates to the Constitutional Convention were Luther Martin, John Francis Mercer, James McHenry, Daniel Carroll, and Daniel of St. Thomas Jenifer. Martin and Mercer refused to sign the Constitution. The other three, however, did sign. A Maryland convention elected for the purpose approved the federal Constitution on April 28, 1788. In 1791, Maryland and Virginia ceded to the national government the territory known as the District of Columbia. The Virginia portion of the district was later returned to the state, so that now the entire district is former Maryland territory. In 1796 Allegany County was formed of the western part of Washington County.

In the years following the adoption of the Constitution, Maryland prospered. Commerce grew rapidly. Even the Napoleonic wars and the War of 1812 did little lasting injury to the state's prosperity. After the war with England was over, Baltimore business men concerned themselves with western trade routes, and the Baltimore and Ohio Railroad was established. During the War of 1812, British troops made several landings in Maryland. A sizeable expedition landed on the banks of the Patuxent in August 1814, and moved toward Washington. A battle was fought at Bladensburg, the American forces were routed, and the British proceeded to burn the government buildings in Washington. The British then moved toward Baltimore and tried unsuccessfully to reduce Fort McHenry. It was during this attack that Francis Scott Key, a Marylander held on board a British ship, wrote *The Star-Spangled Banner*. Fort McHenry has been restored to its appearance as of 1814 and is now a national park.

The assembly enacted a law in 1818 requiring all banks maintaining main offices outside the state to print their bank notes on special taxed paper. This legislation was aimed directly at the

United States Bank. The act was held unconstitutional by the Supreme Court in the famous case of *McCulloch* v. *Maryland*. William Wirt, a Baltimore lawyer, was nominated for the presidency in 1832 on the anti-Masonic ticket. Carroll County was established in 1836 out of portions of Frederick and Baltimore counties; it was named for Charles Carroll of Carrollton, who, at the time of his death in 1832, was the last surviving signer of the Declaration of Independence. During the presidency of Andrew Jackson, a Maryland lawyer, Roger B. Taney, served as attorney general, secretary of the treasury, and was appointed as chief justice of the Supreme Court. He served in the latter position until 1864. A violent contest in state politics in 1837 and 1838 resulted in constitutional amendments providing for popular election of the governor and the Senate and the abolition of the governor's council.

Maryland's second constitution was adopted in 1851 and lasted until 1864. It provided few major changes in governmental structure. At the time of its adoption, Howard County was created out of a part of Anne Arundel, and Baltimore City was separated from Baltimore County. In the decade before the Civil War there was considerable unrest in the state, particularly in Baltimore. In 1860 the Baltimore police force was placed under state control, and from that date on the state government has not been reluctant to interfere in the city's affairs.

Considerable distress was felt in Baltimore and throughout the state during the Civil War. Maryland was a border state, and its sympathies were clearly divided. Most influential in keeping Maryland officially on the Union side was Reverdy Johnson, one of the nation's leading lawyers for many years and one of Maryland's most illustrious sons. Johnson earlier had served as attorney general under President Taylor and as United States senator. Later he defended President Johnson in the impeachment proceedings brought against the president. Another prominent Marylander of the period was Montgomery Blair, who was postmaster general under Lincoln and who was forced out of the cabinet for political reasons. A riotous attack in Baltimore in 1861 upon Massachusetts troops proceeding through the city resulted in several deaths and led to military control of the city throughout the war. Marylanders fought in both armies. In 1862 the armies of Generals Lee and McClellan fought the Battle of Antietam in Washington County. The passage of Gen. Stonewall Jackson's troops through Frederick during this campaign gave rise to the poem *Barbara Frietchie*. The Confederate armies crossed the state again in proceeding to and from the Battle of Gettysburg in 1863, and in 1864 the two armies again met on Maryland soil at the Battle of the Monocacy. During the war James R. Randall wrote *Maryland, My Maryland* to encourage those of Southern sympathies.

In 1864, Maryland's third constitution was adopted; its principal new features were abolition of slavery, a system of public education, and the disfranchisement of Confederate sympathizers. The fourth constitution, adopted in 1867 and still in effect, resembled that of 1864 closely except that it did not contain repressive features. It provides for a popular vote for every twenty years on the question of a new constitutional convention. The constitution established Wicomico County out of portions of Dorchester and Somerset. In 1872 the western part of Allegany County became Garrett County, named for the president of the Baltimore and Ohio Railroad.

Maryland prosperity reached new heights in the postwar period. It was the period of political dominance by the transportation interests. Arthur Pue Gorman, president of the Chesapeake and Ohio Canal Company, dominated Maryland politics, state and national, from 1880 until his death in 1906. One of the prime battles of the era was over machine or boss politics. Continued efforts brought improvement but never complete eradication of this evil. The adoption of the Australian ballot in 1890 was a step in the right direction. The Baltimore and Ohio Railroad went into the hands of receivers in 1896, but it was returned to its stockholders three years later. In 1896 the state went Republican in the presidential election and all districts returned Republican congressmen. President McKinley called to his cabinet as postmaster general, James A. Gary, a Baltimore manufacturer. After 1900 machine politics still existed but its importance steadily declined. Charles J. Bonaparte of Baltimore served in the Cabinet of President Theodore Roosevelt as secretary of the navy and attorney general. Joseph I. France became Maryland's first popularly-elected United States senator in 1912. Maryland's contributions to World Wars I and II, both military and industrial, were great. The opportunity for a greater share in the war efforts derived in part from proximity to the capital.

JOSEPH M. RAY,
Professor and Head, Department of Government and Politics, University of Maryland.

MARYLAND, University of. It dates back to 1807, when the College of Medicine of Maryland was founded in Baltimore. In 1812, the state General Assembly authorized the college to take the name University of Maryland and to add a faculty of law. A department of dentistry was added in 1882, and a nursing school in 1889. In 1904, the university absorbed the Maryland College of Pharmacy and, in 1923, the Baltimore College of Dental Surgery. The present state university was created in 1920 by merging the University of Maryland with Maryland State College, founded in College Park in 1856. The graduate school, undergraduate colleges, and agricultural experiment station are located in College Park, and the professional schools in Baltimore. In 1948, the university plant was valued at $19,738,349, and the endowment was $2,587,599. There were 1,426 teachers and 14,067 students, including 3,237 women.

MARYLAND YELLOWTHROAT, one of the most familiar of North American warblers (*Geothlypis trichas.*) It is about 5.5 inches

in length, migratory, makes a neatly concealed nest on the ground, almost always in a swamp or near a stream, and lays pink-white eggs delicately dotted with red. The plumage is bright yellow above, duller toward the tail; wings and tail greenish; under parts nearly white; and a characteristic jet-black mask across the face and on the sides of the head. The summer cry is a sharp questioning *"What of it? Where'd ye get it?"* The genus contains several related and similar species, but the Kentucky warbler (*Oporornis*) is no longer included.

MARYPORT, mâr'ĭ-pōrt, an urban district in England, on the Cumberland coast, 28 miles southwest of Carlisle on Solway Firth at the mouth of the Ellen River. It is a seaport, exporting coal, coke, creosote, and tar, and manufacturing chemicals, shoes, and electric goods. The development of Maryport's harbor dates from 1857, and its activity has been largely influenced by the fortunes of the nearby collieries. Pop. (1951) 12,237.

MARYSVILLE, mâr'ĭz-vĭl, city, California, seat of Yuba County, 40 miles north of Sacramento at the confluence of the Yuba and Feather rivers, on state and federal highways, and the Southern Pacific, Western Pacific, and Sacramento Northern (electric) railroads. Altitude 61 feet. A county airport supplements the city's transportation facilities. The surrounding country is predominantly agricultural, with tracts of timber and areas of mineral deposits. The city is a trade center for the farms and orchards that constitute its environment, and engages in the processing of fruits and vegetables. The original city hall, built in 1855, was representative of the brick buildings of its time. Other notable structures include two lodge buildings, the Nagler Building, and the new city hall.

The name Marysville honors Mary Covillaud, wife of one of the founders of the settlement. In 1842 the site of the present city was occupied by a trading post on the California-Oregon Trail. In 1849 a townsite was platted and the city was incorporated in 1851. It has a mayor-council form of government. Pop. (1950) 7,826.

MARYSVILLE, city, Kansas, seat of Marshall County, 70 miles northwest of Topeka, on the Big Blue River, the Union Pacific Railroad, and two federal highways. Located in an agricultural region, it is an active market for dairy products and poultry and its industries include poultry packing, flour milling, and bottling.

Marysville was a former ferry crossing on the Oregon Trail and was incorporated in 1861. It has a mayor-council form of government. Pop. (1950) 3,866.

MARYSVILLE, village, Ohio, seat of Union County, 27 miles northwest of Columbus on state and federal highways and the New York Central Railroad. Altitude 999 feet. It is an agricultural community producing dairy products and seeds and manufacturing heating equipment, chairs, and tile. A Carnegie library and a state reformatory for women are located here. Citizens of Marysville contributed the log cabin symbol and song to the Harrison-Van Buren presidential campaign of 1840.

Settled in 1816, the community was laid out in 1820. A mayor and council administer its government. Pop. (1950) 4,256.

MARYVILLE, mâr'ĭ-vĭl, also -v'l, city, Missouri, seat of Nodaway County, 40 miles north of St. Joseph on U.S. Highway 71 and the Chicago, Burlington, and Quincy, and the Wabash railroads. Altitude 1,036 feet. A trading center for the northwestern corner of the state, it is surrounded by fine farming country producing grains, dairy products, hogs, and poultry. The city's industrial products are lightning rods, tire chains, tools, and cement blocks. It has a standard public school system and is the seat of the Northwest Missouri State College, which has a farm cultivated by students in orcharding and agriculture. The school was established in 1905.

Settled as seat of the newly organized county of Nodaway in 1845, Maryville was named for Mrs. Mary Graham, wife of Amos Graham, who, when only half a dozen families lived there, was its one-man government. The city has a commission form of government. Pop. (1950) 6,834.

MARYVILLE, city, Tennessee, seat of Blount County, 15 miles south of Knoxville on federal highways and the Southern and the Louisville and Nashville railroads. Altitude 1,150 feet. It is near the Great Smoky Mountains National Park, in a timber, quarry, and farm area producing lumber, tobacco, cattle, grain, marble, limestone, slate, dolomite, and sandstone. Manufactures include textiles, coffins, and processed foods. Maryville College (Presbyterian), founded in 1819 as Southern and Western Theological Seminary, is located here. The school was rechartered and given its present name in 1842.

The community grew up around Fort Craig after 1785. In 1790 it received its first charter and was named for the wife of Gov. William Blount. Sam Houston moved to Maryville in 1807, was the proprietor of a store and taught school near the village. Maryville was rechartered as a town in 1907 and became a city in 1927. It has a commission form of government. Pop. (1950) 7,742.

MARYVILLE COLLEGE, a coeducational, liberal arts institution in Maryville, Tenn., affiliated with the Presbyterian church but nonsectarian in curriculum. Its campus covers 385 acres and includes the college woods and a college dairy farm. Founded in 1819 as the Southern and Western Theological Seminary, it became Maryville College in 1842 and 15 years later dropped the theological school.

Maryville grants the degrees of A.B. and B.S. in liberal arts and home economics, and offers several scholarships and student assistance funds for those who otherwise could not meet the enrollment and living costs. The Lamar Memorial Library is one of the largest libraries in Tennessee, with a collection of 55,072 bound volumes (1951).

MASACCIO, mä-sät'chō (real name Tommaso Guidi, gwē'dē), Italian painter: b. San Giovanni, Tuscany, Dec. 21, 1401; d. Rome, about 1428. He went while very young to Rome, where he painted in the church of Saint Clemente a series of frescoes, the finest of which represents Saint Catherine and the doctors before Maxentius. In 1421 he was admitted into the guild of the Speziali at Florence.

Among the works of Masaccio are the frescoes in the Brancacci Chapel of the Carmine, the *Expulsion from Paradise; Saint Peter's Sermon;*

the *Tribute; Saint Peter Baptizing;* and the *Raising of the King's Son,* the last of which was partly painted by Filippino. Consult Knudtzon, *Masaccio og den florentiniske malerkonst* (Copenhagen 1875); Delaborde, *Les oeuvres et la manière de Masaccio* (Paris 1876); Schmarsow, *Masaccio Studien* (Cassel, Ger. 1895).

MASAI, mä-sī', an East African race, speaking a language of Hamitic origin, and living in Kenya Colony, east of Lake Victoria. The Masais are men of large stature and fine physique. They are a warlike people and live mostly in military kraals, eating nothing but meat and drinking nothing but milk. The labor is done by women and children. They are to a certain degree nomadic, live in huts constructed of boughs, and enclose their villages with huge thorn fences. Because of the climate they are better clothed than tribes of the warmer regions. Consult Thomson, *Through Masai Land* (London 1885); Hollis, A. C., *The Masai: Their Language and Folklore* (Oxford 1905); Merker, M., *Die Masai,* 2d ed. (Berlin 1910).

MASAN, a Korean port at the head of Chinhai Bay on the south coast, with a screen of picturesque hills for background. It has a superb view of the bay, and is considered a salubrious resort. In the 16th century the Korean admiral, Li Shunsin (Yisunsin), defeated the Japanese fleet of Hideyoshi here along the Chinhai Bay. Old Masan is ancient and thoroughly Korean; New Masan is westernized with regularly laid-out streets. Masan is 25 miles by rail from Samnangjin on the main line of Pusan-Seoul, and lies between Pusan (Fusan) and Chinju. Pop. (1946) 82,175.

MASANIELLO, mä-zä-nyĕl'lō, the commonly used name of Tommaso Aniello, Italian revolutionist: b. Amalfi, 1623?; d. Naples, July 16, 1647. He was a fisherman at Amalfi, and in 1647 roused and led an insurrection in Naples against the Spanish viceroy, the duke of Arcos. He was successful and obtained the abolition of unjust taxes and the revocation of an order to establish the Inquistion at Naples. The fruit taxes were abolished and the old civic rights restored. But the people soon rose against him, and he was assassinated. An opera, music by Auber, libretto by Scribe and Delavigne, based on his career, was presented in 1828 in Paris as *La Muette de Portici,* and in 1829 in England, in English, as *Masaniello.* Consult Saavedra, *La insurrección de Napoli en 1647* (Madrid 1849).

MASARYK, mä'sä-rĭk, **Jan Garrigue,** Czechoslovak statesman: b. Prague, Bohemia, Sept. 14, 1886; d. there, March 10, 1948. Only son of the Czech nationalist leader, Tomáš G. Masaryk (q.v.) and an American mother, he was educated in Prague. In 1906, before completing his studies at Charles University, he left Austria to visit the United States, where he studied at Boston University, and worked as an ironworker and pianist in a motion picture theater. As an Austrian subject he was forced to serve in the army through World War I. He joined his father in Prague in 1918 and aided in the establishment of the republic of Czechoslovakia. Chargé d'affaires at Washington in 1919, two years later he became private secretary to Eduard Beneš (q.v.). After service in the Ministry of Foreign Affairs, he was appointed minister to Great Britain in 1925, resigning in 1938 in protest aganst the French and British surrender at Munich. Reporting his resignation to Lord Halifax, he closed his note with the words: "The nation of St. Wenceslas, John Huss, and Thomas Masaryk will not be a nation of slaves." He was appointed foreign minister of the government in exile organized by Beneš in July 1940, and later deputy prime minister. He was still foreign minister at the time of the Communist coup d'état of Feb. 27, 1948. He did not resign, perhaps hoping that the loss of Czech liberties was not irretrievable. Six hours after his death, the government announced that he had committed suicide by jumping from a third-floor window of the Foreign Ministry Building. Whether his death resulted from suicide or defenestration will perhaps never be known. An elaborate state funeral was decreed. The government explained the asserted suicide as motivated by his anguish over the reproaches of anti-Communist friends for remaining a member of a Communist government.

MASARYK, Tomáš Garrigue, first president of Czechoslovakia: b. Hodonín, Moravia, Mar. 7, 1850; d. Prague, Sept. 14, 1937. A Slovak by birth and the son of poor parents, he was apprenticed to a blacksmith after receiving an elementary education. Becoming a teacher, he studied philosophy at the universities of Vienna and Leipzig, and in 1879 began lecturing on philosophy at Vienna. Professor at the new Bohemian university in Prague (1882), he became noted as an interpreter of modern political and social tendencies and through his efforts to reconcile and reunite Serbs and Croats. Elected to the Austrian Parliament in 1891, he boldly criticized the government's policy toward Bosnia-Hercegovina, resigning his seat in 1893 in protest against the negative policy of Czech nationalists. For several years he edited the critical review *Athenaeum* which he founded in 1883, and later *Naše doba* (*Our Epoch*), founded in 1893. He married an American and as a political economist was well known in the United States. His many writings include: *Suicide and Modern Civilization* (1881); *Blaise Pascal* (1883); *The Philosophical and Sociological Foundation of Marxism* (1898); *Russia and Europe* (1913); *The New Europe* (1918); *The Making of a State* (1925), and his autobiography *President Masaryk Tells His Story,* recounted by Karel Capek (1935).

Among these historical and philosophical writings, his powerful criticism of Marxian socialism and the great work on Russia and Europe stand foremost. In 1907 he was re-elected to the Austrian Parliament. During the Friedjung trial in 1909 he helped to expose the forgeries upon which Count Aehrenthal based his annexation of Bosnia and Hercegovina. When World War I broke out he remained in Prague until December 1914, when he escaped to Italy and thence to England in time to avoid arrest. He then became lecturer in the School of Slavonic Studies at the University of London. On Dec. 6, 1916, the Austrian clerical organ, *Reichspost,* announced that Professor Masaryk had been sentenced to death *in contumaciam* for high treason. Meanwhile, the condemned man was rapidly gaining wide recognition among the Allies as the leader of the national struggle for Czechoslovak independence. Together with Dr. Beneš and

Colonel Stefanik, he formed the triumvirate which was ultimately recognized by the Allied governments as the trustee for the future government of Bohemia. In the spring of 1917, Professor Masaryk was called to Russia by Professor Milyukov, but soon realized the hopelessness of the Russian situation and devoted strenuous efforts to organizing the Czechoslovak Army. He preceded this force to Vladivostok and went on to Tokyo and Washington. He had several audiences with President Wilson and addressed many public meetings. The Republic of Czechoslovakia was recognized by Italy on April 23, 1918; by Great Britain on Aug. 13, 1918; by the United States on Sept. 2, 1918; and by Japan, Sept. 9, 1918. The Declaration of Independence was formally published at Washington on Oct. 18, 1918, and the republic was formally proclaimed at Prague on October 28. The constitution was drafted in Geneva by Nov. 2, 1918. On Nov. 14, 1918, Masaryk was elected first president of the republic. In his first message to the members of the National Assembly on Dec. 26, 1918, in the presence of representatives of the Allied governments, the president expressed the "gratitude and unshakable fidelity" of the republic toward the Allies. He was re-elected president on May 27, 1920, and again in May 1927 and in May 1934. He resigned in December 1935 and was succeeded by Dr. Edward Beneš.

MASAYA, mä-sī'ä, Nicaragua, town, in the western part, about 12 miles north of Lake Nicaragua and near Masaya volcano, which is 3,000 feet in height. The town is connected by railroad with the cities of Leon, Managua and Granada. Masaya is situated in an agricultural region, of which tobacco is one of the principal productions. Coffee, sugar and rice are also grown in the vicinity. The inhabitants are mostly Indians. Pop. 13,000.

MASBATE, măs-bä'tā, Philippines, an island of the Philippines in the eastern part of the Visayan Sea, south of Luzon and northwest of Samar; greatest length, 82 miles northwest to southeast; width, 45 miles; area, 1,236 square miles. It is very mountainous, the central chain being semi-circular in shape, extending from southwest to southeast, and there are several rivers of considerable size. Communication between towns and villages is mostly by water, as there are few roads or even trails. The staple products are sugarcane, cotton, chocolate and hemp; tobacco of a strong quality is also raised. One of the chief industries is that of stock-raising (cattle, horses and hogs); over 1,000 head of cattle are ordinarily shipped monthly to other parts of the Philippines, mostly to Manila. This industry has been menaced in recent years by the rinderpest. Other important industries are the manufacture of sugar sacks from the buri palm, the manufacture of palm mats of superior workmanship and coloring, weaving, lumbering and fishing; there is also an active trade with Manila. In March 1901 the island was united with Ticao (140 square miles), Burias (258 square miles) and the small adjacent islands, to form the province of Masbate; area of the whole province 1,732 square miles. Civil government was inaugurated in 1901. The inhabitants are nearly all Visayans, but there are over 2,000 Bicols and about 580 Tagalogs. Pop. of province 43,000; Masbate and Ticao (q.v.) 30,000.

MASBATE, Philippines, a pueblo and the capital of Masbate province, situated in the northeastern part of the island of Masbate on a peninsula dividing Palánog Port from Mobô Bay. It is a port of entry, and has a considerable trade. It has a church, a school and some well-constructed buildings. Pop. 2,900.

MASCAGNI, Pietro, pē'ā-trō mäs-kän'yē, Italian composer: b. Leghorn, Tuscany, Dec. 7, 1863; d. Rome, Aug. 2, 1945. He was educated at the Milan Conservatoire and in 1890 his opera *Cavalleria Rusticana* brought him immediate recognition in the musical world. From 1895 to 1903 he was director of the Rossini Lyceum at Pesaro. His songs and ballads became popular and his successful career as a composer was further aided by his operas *L'Amico Fritz* (1891); *I Rantzau* (1892); *Guglielmo Ratcliff* (1895); *Silvano* (1895); *Zanetto* (1896); *Iris* (1898); *Le Maschere* (1901); *Amica* (1905); *Isabeau* (1911); *Parisina* (1913); *Lodoletta* (1917); *Il Piccolo Marat* (1919), and *Nerone* (1935). In 1902 he visited the United States on an operatic tour, and in 1911 made a similar trip throughout South America.

MASCAGNITE, măs-kăn'yīt, or **MASCAGNINE,** a native sulphate of ammonium, occurring notably at Sasso in Tuscany, where it was discovered by Mascagni, from whom it was named.

MASCARA, Algeria, fortified town and capital of an arrondissement in the province of Oran, 45 miles southeast of the city of that name, at the base of the Little Atlas Range. The town stands on the site of a Roman colony, is surrounded by walls, but has few ancient remains. It is purely of the French colonial type. For two centuries down to 1800 it was the capital of a Turkish beylik; in 1832 it became the capital of Abd-el-Kader; in 1835 it was ravaged by the French, but was reoccupied by Abd-el-Kader in 1838 only to fall finally to the French in 1841. Wine, cereals and oil are the principal items of trade. Pop. 28,693.

MASCARENE (măs-ka-rēn') ISLANDS, a collective name for the islands of Bourbon, Mauritius and Rodriguez, named after Mascarenhas, a Portuguese navigator, who discovered Bourbon in 1545.

MASCARON, Jules, French preacher: b. Marseilles, 1634; d. Agen, 1703. He became a member of the Congregation of the Oratory and soon established a great reputation as a preacher in the provincial cities. He preached at court in 1666 and thereafter he was a favorite of Louis XIV. Mascaron was consecrated bishop of Tulle in 1671 and eight years later was translated to the more important diocese of Agen. He still continued to preach at court and in 1675 delivered his greatest oration at the funeral of Marshal Turenne. His principal sermons were edited by a member of the congregation, Father Borde, in 1704. Consult 'Œuvres de Mascaron' (Paris 1828).

MASCART, Eleuthère Elie Nicolas, French physicist: b. Quarouble, Nord, 1837; d. 1908. He received his education at the École Normale Supérieure and in 1872 became professor at the Collège de France. From 1878 to 1907 he was director of the Government Central

Meteorological Bureau. He was also member of the International Bureau of Weights and Measures; was elected to the Academy of Sciences in 1884 and became its president in 1904. He was made commander of the Legion of Honor in 1889. Mascart's investigations were mainly confined to spectroscopy, electricity and terrestrial magnetism. He published 'Eléments de mécanique' (1866); 'Traité d'électricité statique' (1876); 'Leçons sur l'electricité et le magnétisme,' with Joubert (1882); 'Méthode de mesures et applications' (1882); 'Traité d'optique' (1889); 'Traité de magnétisme terrestre' (1900).

MASCHERONIANA. The 'Mascheroniana' of Vincenzo Monti (1754–1826) is an unfinished epic «vision» in five cantos of *terza rima*. It represents the third of four periods into which Monti's intellectual and artistic life may be divided. The first is the period of the Arcadian lyrics and the tragedies; the second that of the 'Bassvilliana' (1793), a diatribe against the French Terror; the third, that of the Napoleonic poems, the 'Prometeo' (1797), the 'Mascheroniana' (1801) and the 'Bard of the Black Forest' (1806); the fourth (1815–19) that of the «Austrian» poems, the 'Mystic May,' the 'Return of Astrea', the 'Invitation to Pallas,' the classic translations and the critical works.

Monti's permanent and most interesting distinction is that, as a man thoroughly permeated with the culture and mental traits of the Old Régime, he lived through the Revolutionary period without understanding any aspect of it. In the course of his life he assumed with equal sincerity the position of each dominant party. He assailed the Revolution and then accepted it. He hailed Napoleon the liberator, and then Napoleon the despot. Italians like to find in all these gyrations a thread of consistency: the concept of resurrected Italy. Unfortunately, however, Monti also embraced and sang the Austrian restoration.

This mental confusion, not to say moral perversity, has its counterpart in Monti's poetry. He is fundamentally an Arcadian, who vaguely perceives the emotions and the character of a new age, without visualizing them clearly as an artist and without finding for them an appropriate formal expression. In a sense this makes his poems extremely interesting; for wholly in the Arcadian manner, they are admirably calculated to show the limitations of that manner. The 'Mascheroniana,' which owes its popularity in Italy to its nationalistic spirit, aims to project the miserable Italy of the revolution upon the great Italy of the past and a greater Italy of the future, of which to be sure Napoleon is to be the artisan. Here is a trite theme but one of potentiality. Monti, however, being Monti, transports it into the Arcadian world, a world by itself, apart from, perhaps superior to, any real world. It becomes «literature» through «plot» and «form.» As regards plot, Monti invents a vision of the Dante series: to commemorate a friend, he narrates the passing of the soul of Lorenzo Mascheroni, an eminent mathematician, from earth to heaven, bringing him, en route, in touch with the souls of Parini, Beccaria and others. These great Italians discourse on contemporary and past Italian conditions. Critics who like «literature» find, in the elaborate descriptions here, distinguished merits of vivacity and coloring. Then, as we pass to «form,» we get a wealth of allusion, classic and Italian; but especially great ingeniousness of metaphor, and a truly remarkable success in epigram and sententiousness. Here, indeed, we find those traits which give Monti kinship with the greatest writers and which by themselves give the 'Mascheroniana' a place in literary history. But that is all. Monti cannot solve the neo-classic paradox: he cannot bring his virtual poetic theme (nationalism or patriotism) into contact with his «plot» and his «form.» The theme remains undeveloped, and the plot and the form without poetic life. When Monti, for instance, wishes to denounce Robespierre, he pictures God shuddering on his throne and the angels gracefully hiding very beautiful heads under very beautiful wings. All this has nothing to do with Robespierre. The vice of neo-classicism is that it works on three parallel lines, one for the «plot,» another for the «form» (figure, allusion, episode, metaphor); and another for the animating poetic emotion. And the lines never meet. The 'Mascheroniana' is a classic poem; and it died, as a poem, with the school it represents, retaining an historical interest, for its characteristic defects, and as one of the records of Monti's intellectual reversals.

ARTHUR LIVINGSTON.

MASCOTS AND HOODOOS, a mascot is a person or thing supposed to bring good luck, while a hoodoo is an influence of evil. Another name for the hoodoo is Jonah, a term originating with superstitious sailors. The word mascot was first introduced into literature by means of the comic opera 'La Mascotte' written by Audran, but in France it appears to have been in common use for a long time previously among gamesters and sporting characters. It was used to signify some object, animate or inanimate, which like the luck-penny brought good fortune to its possessor. The word is traced back to the *patois* of Provence and Gascony, where a mascot is something which brings luck to a household. Etymologically the word is derived from masque (masked or concealed), which in provincial French is applied — as *né coiffé* is in more polished French — to a child born with a caul. Such a child was believed to be destined, not only to be lucky himself, but to be the source of luck to others. In most European countries there is a large trade in charms and talismans to bring good fortune.

The term hoodoo is a manifest corruption of African voodooism and is a modified superstition of the system of terrorism which has been cultivated for years by the voodoo priesthood with remarkable success. There is, however, no scientific foundation for belief in either hoodoos or mascots, any more than there is in a reliance upon dreams and visions. Natural laws are not to be set aside by touching a hunchback or carrying a rabbit's foot in one's pocket. It is a fact, however, that in every age of the world the goddess of chance has been worshipped under one name or another, and modern civilization has not destroyed this cult. The belief in the mascot for luck, or the hoodoo for ill-luck, is an indication of weakness and lack of decision. In the 'Iliad,' when Hector is told that «the birds are against him,» and all the omens unlucky, the Trojan hero makes answer:

"Without a bird his sword the true man draws; and asks no omen but his country's cause." See also OMEN; SUPERSTITION.

MASCOUTEN, a belligerent tribe of Algonquians, the French *Nation du Feu,* "Fire Nation," dwelling along the Illinois River. They were at constant warfare with their neighbors, and are first mentioned by the earliest French missionaries as inhabiting southern Michigan, whence, according to the traditions of the Ojibwas and Ottawas, they had been driven by the latter from the region around modern Mackinaw. In 1712, united with the Foxes and Kickapoo, they were almost exterminated, first by the French and afterward by the Pottawattomi and their allies. The remnants migrated westward and are last mentioned in 1779 as living with the Piankishaws and Kickapoos on the Wabash River. The name is derived from Mashkodainsug, "little prairie people," a title now borne by a tribe of Pottawattomi Indians resident in Kansas.

MASEFIELD, John, English poet and dramatist: b. 1875. In his youth he shipped before the mast on the *Conway,* in which he made several voyages. For a time also he was engaged as a farm laborer and in the 90's spent a short time as attendant in a Sixth avenue saloon in New York. These early experiences he later turned to account in his literary work. After his wanderings Masefield settled near London and became a regular contributor of prose and verse to the periodicals of the metropolis. He was awarded the Edmond de Polignac prize for poetry in 1912, and made Poet-Laureate in 1930. Masefield won literary fame mainly through his sea ballads and the narrative poems, 'The Everlasting Mercy' and 'The Widow in the Bye Street.' His verse is intensely realistic, full of pathos, although the verse form is often crude. His stories for boys represent his best efforts in prose and are reminiscent of Marryat at his best. His plays lack technique and are little suited to stage presentation, but give evidence of growing power. His works, in addition to those already mentioned, are 'Salt Water Ballads' (1902); 'A Mainsail Haul' (1905; 1913); 'A Tarpaulin Master'; 'Ballads'; 'Captain Margaret'; 'The Tragedy of Nan and other Plays' (1910); 'The Tragedy of Pompey the Great' (1910); 'Multitude and Solitude'; 'The Street of To-day'; 'Poems and Ballads'; 'William Shakespeare'; 'Dauber'; 'The Daffodil Fields'; 'Philip the King' (1914); 'Personal Recollections of John M. Synge'; 'The Faithful'; 'Sonnets and Poems'; 'The Locked Chest'; 'Melloney Holtspur' (1922); 'Sard Harken' (1924); 'Recent Prose' (1924); 'Odtaa' (1926), etc. Masefield edited 'The Voyages of Captain William Dampier' (1906); and wrote introductions to 'Hakluyt's Voyages' and 'The Voyages of Marco Polo.' The following plays have been produced: 'The Campden Wonder'; 'Nan'; 'Pompey the Great'; 'Sweeps of Ninety-Eight'; 'Philip the King'; 'The Faithful'; 'Mrs Harrison'; 'Good Friday'; 'The Trial of Jesus' (1925).

MASHAM, Abigail Hill, LADY, confidante and favorite of Queen Anne of England: b. London, 1670; d. 6 Dec. 1734. A cousin of Sarah Jennings, Duchess of Marlborough, and also related to Robert Harley, Earl of Oxford, she passed from the service of Lady Rivers, thanks to the influence of the Duchess of Marlborough, into that of Queen Anne, in whose favor she soon displaced her cousin, making every effort to turn the queen from the Marlboroughs and Whiggery to Toryism and even Jacobitism. She was married to Samuel Masham in 1707; had him made a baron in 1712; brought her kinsman Oxford into power, but soon turned him out; and, in short, was the power behind the throne, succeeding her cousin Marlborough. She retired after Queen Anne's death. She was a plain, homely, red-nosed woman, much bepraised by Swift and accused of vulgarity, meanness and covetousness by the Whigs. See ANNE, QUEEN OF ENGLAND.

MASHAM, Samuel Cunliffe Lister, 1ST BARON, English inventor: b. Calverly Hall, near Bradford, 1 Jan. 1815; d. Swinton Park, York, 2 Feb. 1906. In 1838 his father started Samuel and his brother John as worsted manufacturers in a mill at Manningham. About 1845 he perfected a wool-combing machine which revolutionized textile processes and made the inventor wealthy. He secured a profit of $5,000 on every machine sold. From 1855 to 1864 he spent huge sums in perfecting a silk-combing machine and at one time was perilously near bankruptcy. The machine was brought out in 1864 and enabled him to produce valuable yarn from the hitherto useless silk waste. Masham also perfected a velvet loom for piled fabrics, and after 1878 his income from his inventions exceeded $1,000,000 annually. He opposed free-trade because the American protective tariff seriously limited his business. He was created 1st Baron Masham in 1891. He wrote 'Lord Masham's Inventions' (1905).

MASHKODAINSUG. See MASCOUTEN.

MASHONALAND, mą-shō'ną-länd, South Africa, a province forming the northeastern portion of South Rhodesia, between the Zambesi and Matabeleland. It consists largely of open plains and table-lands, is well watered by the Umniate and other feeders of the Zambesi and is very fertile. The Mashonas belong to the Kaffir race and were formerly masters of the whole territory between the Limpopo and the Zambesi, but were cooped up within their present territory by the powerful Matabele, whom they were unable successfully to resist. They are a peaceful people, clever as smiths and as weavers of cotton fabrics. The country came under the management of the British South Africa Company in 1890. It is rich in gold, which has been mined here at some remote and unknown period, old workings being still visible, and Mashonaland is with some degree of probability identified with the biblical Land of Ophir. In 1923 it became part of Southern Rhodesia when that country became a British colony. The principal towns are Salisbury, Hartley, Gatooma, Umtali and Victoria. Salisbury is connected with Beira, Portuguese East Africa, by a railroad. From Salisbury north another railroad extends 580 miles through Buluwayo to the Victoria Falls, where there is a new bridge over the Zambesi. This road is a section of the Cape to Cairo Railway. For the antiquities, anthropology, history, etc., of Mashonaland, consult Bent, J. T., 'Ruined Cities of Mashonaland' (London 1892); Hall, R. N., 'Prehistoric Rhodesia' (Chicago 1910); id., 'Great Zimbabwe' (London 1905); Darter, A., 'Pioneers of Ma-

shonaland (London 1914); Randall-MacIver, D., *Mediaeval Rhodesia* (London 1906).

MASINISSA, măs-ĭ-nĭs'ą or **MASSINISSA,** king of Numidia: b. 238 B.C.; d. 148 B.C. He was at first ruler only of the east portion of the country, but latterly of the whole, having, by the help of the Romans during the Second Punic War, defeated Syphax, king of Western Numidia, taking him prisoner with his wife, Sophonisba, whose hand had formerly been promised to Masinissa. Masinissa now made her his wife, but Scipio Africanus, fearful of her influence, claimed her as a prisoner of Rome. Unable to resist, Masinissa sent her a poisoned chalice, of which she voluntarily drank. Masinissa commanded the Roman cavalry on the right wing at the battle of Zama, which ended the Second Punic War (201 B.C.). As a reward the Romans gave him the territory formerly held by Syphax. In peace he proved himself an efficient administrator.

MASK, a covering for the face, often shaped so as to form a rude representation of human or animal features. The study of masks, or false faces, forms an important chapter in anthropology as well as in the history of art. Evidence of the manufacture and use of masks appears in the Old Stone Age among pictures preserved on the walls of caverns in western Europe. Perhaps the best known of these is the figure of a dancing man in the cavern of Trois Frères, Ariège, France, painted in the Magdalenian period. The head of this figure is covered by the skull of a deer, the attached skin covering his body. A visitor to Indian villages in New Mexico and Arizona may still see among other masked dancers a so-called Kachina, strikingly reminiscent of this very ancient cave dancer, his body draped in the skin of a deer, his head hidden in a grotesque mask upon which are mounted the antlers of a deer.

The best surviving cave drawings of masked dancers, however, are to be seen in the cave of Mige in France (see Keith Henderson, *Prehistoric Man.*) The heads of these dancers are covered with the skulls of chamoislike animals, the attached skins of the original living creatures falling over the dancers' bodies. So well-drawn are these figures that one can almost see the vigorous movements of the dancers.

Drawings published by George Catlin (1796–1872), Maximilian zu Wied (1782–1867) and other early explorers of the Missouri River country show us Indians of the time dancing in masks representing the heads of bears and buffalo, with their bodies draped in the skins of these animals.

The transition from the primitive realistic use of animal heads to the manufacture of imaginative demon and dragon faces seems to have been made in early Neolithic times, appearing in the art of the most ancient civilizations of 6,000 and more years ago. These evidences of antiquity in the use of masks, and the survival of their uses among all primitive peoples of the world, justify the assumption that the use of masks is as universal as speech and almost as ancient in origin. Their function as a mode of expression is so fundamental that they are still used by the most civilized peoples. That they played an indispensable role in the early evolution of the stage is obvious.

Anthropologists consider one of the most universal interests of mankind to have been the observation and study of mammals, birds, and reptiles. Primitive man was intrigued by the mysterious behavior of animals, which was everywhere interpreted in terms of human experience. Cave man art suggests that, almost from the earliest times, man chose animal characters for his fictional narratives. Surviving folk tales collected from savage peoples and those handed down to us from our pagan European ancestors indicate that the bedtime story, Uncle Remus stories, and other such tales are as old as the human race. Drawings in caves indicate that dancing began with the impersonation of real living serpents and animals with masks and costumes, leading soon to imaging grotesque demons and saints, as the case might require.

While the use of masks in the abstract is ancient and universal, masks vary in style, technique, and art to such a degree that a world-wide collection of masks throws much light on human geography, history, and archaeology. Like stone tools, metalwork, and ceramics, their classification as to place and time affords one of the most satisfactory objective records of man's career upon the earth. Hence, they play a large role in museums of anthropology, history, and art. In fact it is difficult to conceive of any study of art, graphic or theatrical, not based objectively upon collections of masks. For example, the role played by masked animal gods in the tomb and temple paintings of Egypt, in the heroic sculptures of Ur, Babylon, and other ancient Asiatic cities, is extremely illuminating, and so is the part played by the masked gods of Tibet and China, who appear in religious festival folk dances. How empty and dreary would be the mere verbal narratives of ancient and surviving primitive peoples without collections of masks to use as illustrations!

The modern geographical distribution of masks is of interest. In the New World, the Indians show special regional styles in masks. The most elaborate development appears among the coastal Indians of British Columbia and southern Alaska, where large wooden masks are in use. These objects form a large part of museum collections from that area. Both animal and human heads are depicted in these masks; some of the heads representing birds and mammals are of extraordinary size, and by means of cords the wearer can roll their eyes about, and open and snap their jaws. Other heads are double or triplicate, opened out by the dancers at will, revealing entirely different faces within. Even the Eskimos of Alaska use masks, but Eskimo masks are smaller, not so complicated.

The Indians of the Southwest, the Apache, Navajo, and Pueblo tribes, use numerous highly colored masks of wood and textile materials to impersonate gods and other supernatural creatures.

The Plains Indians formerly supported a series of ceremonies in which some animal masks were worn, but, comparatively speaking, their mask culture was weak. The same thing is true of California Indians. East of the Mississippi, the chief mask area is among the Iroquois, whose false-face ceremonies are famous. Some of the Iroquois masks are woven of cornhusks, but the most conspicuous are those of wood;

fearful distortions of the human face used in an annual ceremony to drive away disease. In pre-Columbian Mexico, priests wore magnificent masks, decked with plumes. Warriors led their troops to battle arrayed in impressive plumed masks, as did the peoples of the Andean Highlands. The marginal peoples in both of the Americas presented far less developed mask practices, but rarely is a tribe found wholly ignorant of the art of using masks.

In the Old World, the development of masks is also uneven. Some masks were made in Africa, notably in central West Africa and in isolated parts of the Sudan, but, as a whole, the development of masks throughout the continent remained weak. India, also, has shown little interest in masks. On the other hand, the religious cults of Tibet, Siam, China, and the Malay countries reveled in the production and use of masks. New Guinea, Indonesia, and parts of Melanesia are conspicuous producers of masks and masked dancing. Polynesia, on the other hand made little use of such objects.

Australia is often thought of as devoid of crafts and arts, but often the chief actors in their elaborate ceremonies have masks built upon their bodies and faces, of almost unbelievable complexity and conceived on highly original lines. The likeness of some of these masks have been preserved by photography; usually they are destroyed in removing them from the body.

Siberia and Arctic America were weak in the use of masks. Europe saw a considerable development of masks in early times, but the Romans showed less interest in them. While the old religions of ancient Mediterranean civilizations show the use of masks, these objects found their way but moderately into pre-Roman Europe. Surviving folk festivals in Europe suggest that, in early pagan times, masks were important in clownish performances rather than in serious impersonations of supernatural beings.

C., "The Sia," *Eleventh Report of the Bureau of Ethnology* (Washington 1893); Boas, F., "The Social Organization and Secret Societies of the Kwakiutl Indians," *Report of the United States National Museum for 1895* (Washington 1896); Hodge, G. M., *The Kachinas Are Coming* (Los Angeles 1936); Wissler, C., "Masks," *Science Guide*, American Museum of Natural History (New York 1946).

CLARK WISSLER.

MODERN MASKS

Masks to cover the face or head are used for playful disguising, as in masquerade and carnival; for dramatic effect or characterization, as in ballet, theater, and film; and for protection, as in sport, industry, and war.

Masquerade, carnival, and theater masks are descended from the primitive ritual falseface which identified the wearer, by mystic transference of properties and spirit, with the being represented by the mask. It is for this reason that a masker, even in this day, when a matter-of-fact attitude toward the supernatural has become common, still produces an uncanny effect.

At masquerades the domino, or halfmask, is generally worn. It covers the upper half of the face but leaves the mouth free. The halfmask, developed in the Italian masked comedy of the Renaissance, when mimes began to improvise speeches, became popular as a stock disguise in the streets at carnival time, and even fashionable as a sunshade and adjunct to coquetry. Often black, the halfmask may be colored as well; it is made of velvet, satin, or papier-mâché, shaped to fit over the forehead, cheeks, and nose, and is held on by cords or ribbons running from the sides around the head.

During carnival in Latin countries, many special masks are worn in parades and spectacles. Masks may have the form of gigantic heads, of humanized animals, or they may be fantastic. In Basel and other Swiss cities, there are masking societies which vie with each other in inventing caricatures with current application; such masks may comment upon political affairs. In the Tyrol, some carnival masks, clearly survivals of pagan times, represent demons and animistic spirits, while others are grotesques without historic models. In Mexico and Guatemala, some masks hark back to pre-Columbian times, some commemorate the coming of the conquistadores, and some are modern inventions. Carnival masks are often made of papier-mâché, and are discarded after being worn once; but some (as in the Tyrol) are of carved wood, or (as in Mexico) of tin or gesso-covered cactus pith.

Masks may be said to have an unknown tradition of use in the theater. Greek and Egyptian drama, arising from a religious ceremonial, were masked. At the height of its native development, about 100 B.C., Roman drama lost the mask, but regained it when Greek theater fashions came in at the time of Quintus Roscius. Traveling mountebanks of the Middle Ages played in masks; church drama had need of masks for the figures of God, angels, saints, and devils. In the day of Shakespeare, the court masque continued the medieval usage of players in vizors. Ballet dancers often wore masks, for ballet grew out of the court masque. The plays of the Roman playwright Terence (190?–?159 B.C.) were revived in masks when Goethe produced them at Weimar in the 18th century. English pantomimes and continental extravaganzas in the 19th century frequently used masked sprites, demons, and grotesques; a procession of "big heads," or players with oversized masks, was an expected feature of all such entertainments.

A revival of the mask in the theater at the beginning of the present century may be traced to Gordon Craig's writings in his magazine, *The Mask,* and to his mask designs. From 1910 on, V. E. Meyerhold in St. Petersburg, in his struggle against the realistic stage, used masks in his formalized productions of plays dealing with the fantastic and the subconscious. In 1914, Percy MacKaye used masks in vast open-air pageants such as his *Masque of St. Louis.* In the 1920's, there was a widespread experimentation with masks in the theatre. Edmond Dulac made masks for poetic dance-dramas by William Butler Yeats, in the manner of the classic masked Japanese drama. W. T. Benda's masks, which Benda first made for masquerades were worn by the dancer Margaret Severn. Pablo Picasso and Fernand Léger designed cubist masks for the ballet in Paris. Oscar Schlemmer made masks for mechanistic ballets at the Bauhaus in Dessau.

Eugene O'Neill, having written a scene of masked Fifth Avenue paraders for his play *The Hairy Ape* (1922), to show how the world looked through the eyes of a character in the play, devised a masked dramatization of Samuel Taylor Coleridge's *The Ancient Mariner,* then used masks for psychological effect in *Lazarus*

Laughed, and as symbols of character in *The Great God Brown.*

In 1920, Robert Edmund Jones designed a production of *Macbeth* in which the huge brooding masks of the Weird Sisters dominated the stage as part of the expressionistic scenery. Ernst Stern made masks for Max Reinhardt's productions in Germany. Norman Bel Geddes designed masks for the New York production of Reinhardt's *The Miracle.* Lee Simonson injected occasional masks into such Theater Guild productions as *The Adding Machine* by Elmer Rice, *Man and the Masses* by Ernst Toller, and *Back to Methusaleh* by George Bernard Shaw. For New York revues, John Held designed caricatures of film stars, and Jo Davidson made mask portraits of drama critics. James Light fitted masks to most of the characters in the Provincetown Playhouse production of August Strindberg's *The Spook Sonata* in 1924. Remo Bufano made masks for productions of *Alice in Wonderland,* Thornton Wilder's *The Skin of Your Teeth,* and Shaw's *Androcles and the Lion.* Masks are sometimes needed to give actors the look of realistic animals or of special characters; at other times, to give them an unrealistic appearance. A masked actor may change his stature or proportions; he approaches the physical fluidity of a marionette.

Protective masks of wire, leather-covered pads, and metal mesh are worn by fencers, baseball catchers, hockey guards, and other sportsmen. Eskimos and skiers wear halfmasks with goggles to keep snow glare from the eyes. Bandits wear handkerchiefs over the lower parts of their faces. Surgeons wear protective masks to maintain antiseptic conditions, or place them over patients to administer ether. A diver's helmet is a form of head mask. Wax-lined masks are placed over the skin for beauty treatments. Dust respirators and masks for paint sprayers, welders, and workers with acids are widely used in industry. Gas masks were provided in World War II, much as metal vizors were provided for the knights of the Renaissance.

Bibliography.—Macgowan, K., and Rosse, H., *Masks and Demons* (New York 1923); Kniffin, H. R., *Masks* (Peoria 1931); Benda, W. T., *Masks* (New York 1944).

PAUL MCPHARLIN,
Late Chairman, The Puppeteers of America.

MASOCHISM, a term used in analytic psychology to denote a tendency, usual in infancy and early childhood but outgrown or sublimated in later life, to take pleasure in having pain inflicted upon oneself. The term is derived from von Sacher-Masoch, an Austrian novelist, in whose stories many of the main characters exhibited this trait in an excessive degree. A mild degree of masochism is evinced by many average men and women, particularly those who spend much of their time complaining about wrongs, injuries, pains, etc., suffered by themselves, the inference being that their unconscious masochism drives them to be occupied mentally with pain and the details of its effect upon themselves.

MASON, mā'sŏn, **Alfred Edward Woodley,** English novelist: b. May 7, 1865. He was educated at Oxford and among his works, the majority of which have been reprinted in the United States, are *A Romance of Wastdale* (1895); *The Courtship of Morrice Buckler* (1896, dramatized 1897); *The Philanderers* (1897); *Lawrence Clavering* (1897); *Miranda of the Balcony* (1899, dramatized in New York 1901); *The Watchers* (1899); *Clementina* (1901); *The Four Feathers* (1902); *The Truants* (1904); *The Broken Road* (1907); *The Turnstile* (1912); *The Four Corners of the World* (1917); *The Summons* (1920); *Running Water* (play, 1922); *The Winding Stairs* (1923); *The Three Gentlemen* (1932); *Fire Over England* (1936); and *The Life of Francis Drake* (1941).

MASON, Charles, English astronomer and surveyor: b. England, about 1730; d. Philadelphia, February 1787. He was for years assistant astronomer at the Greenwich Observatory and was sent on various expeditions in the service of science. In 1763 he was employed with Jeremiah Dixon to survey the boundary line between Maryland and Pennsylvania and they were engaged in this undertaking until 1767, the line established becoming famous in American history as the Mason and Dixon's Line. They returned to England and Mason was thereafter engaged in astronomical observations and researches until the time, the precise date of which is not known, when he returned to America. His work upon the lunar tables of Tobias Mayer which were published in London in 1787 under the title *Mayer's Lunar Tables Improved by Charles Mason,* enjoyed a high reputation for reliability. In 1860 many of his papers were accidentally discovered at Halifax, N. S.

MASON, Daniel Gregory, American composer and writer on music: b. Brookline, Mass., Nov. 20, 1873. In 1895 he was graduated from Harvard University; he studied music in Boston, New York and Paris. He was professor of music at Columbia University and is well known as a lecturer on music.

MASON, George, American statesman: b. Stafford (now Fairfax) County, in the "Northern Neck" of Virginia, 1725; d. Oct. 7, 1792. He spent his early life on a typical plantation. The same region produced his co-workers in the cause of the American Revolution, Richard Henry Lee and George Washington (qq.v.). Mason seems to have been tutored at home, being grounded in a knowledge of the classics both Latin and English. His younger brother Thomas, was sent to London to study law at the Middle Temple. George Mason was married in 1750 to Ann Eilbeck, who died in 1773. Of this union there were several children. He was married again in 1780 to Sarah Brent.

As a member of the Ohio Company he was identified with his friend, George Washington, in the initial stages of the French and Indian War. In 1759 the two entered the Virginia House of Burgesses together.

Mason drafted the Non-Importation Resolutions, which the Virginia Assembly adopted in 1769, and the Resolves, which were sanctioned by the Virginia Convention and reaffirmed by the Continental Congress in 1774. In these he outlined both a nonintercourse policy with Great Britain and the scheme of a general intercolonial congress. As a member of the Virginia Constitutional Convention of 1776, he is remembered as the author of the Bill of Rights which con-

stitutes so notable a part of the Virginia Constitution of 1776, and was probably the most complete and most advanced statement of man's rights up to that time. Mason was a member of the Virginia Assembly from 1776 to 1780 and from 1786 to 1788. In 1777 the legislature elected him to the Continental Congress but he declined to serve. In 1780 he outlined a plan which Virginia afterwards adopted for ceding to the federal government for claims to the Ohio territory. He was a member of the Constitutional Convention at Philadelphia in 1787 and took active part in discussing the Constitution. He refused to sign it because he held different views on slavery and the navigation acts. He, along with Patrick Henry, in the Virginia Ratification Convention of 1788, threw his influence against ratifications and proposed 20 alterations, some of which were afterwards adopted. He declined to serve as one of the first United States senators from Virginia. With Madison and Jefferson he succeeded in passing a law which disestablished the Episcopalian Church and protected all forms of worship. Thomas Jefferson describes George Mason as "a man of the first order of wisdom among those who acted on the theater of the Revolution."

MASON, James Murray, American legislator: b. Mason's Island, Fairfax County, Va., 3 Nov. 1798; d. near Alexandria, Va., 28 April 1871. He was graduated from the University of Pennsylvania in 1818, studied law and upon being admitted to the bar established a practice at Winchester, Va. He was in public office much of the time and in 1847 was elected to the United States Senate, representing Virginia, where he proved a consistent and strong adherent to the policies favored by his State. He was the author of the Fugitive Slave Law of 1850 and at the outbreak of the Civil War he resigned his seat in the Senate to enter the service of the Confederacy. He was sent to England with Slidell as Confederate commissioner, but was captured on the steamer *Trent* (see TRENT AFFAIR, THE) and taken to Boston where he was confined in Fort Warren until 1862 when he sailed for Europe and until the end of the war endeavored to secure recognition of the Confederacy. After the war Mason lived in Canada until 1868, being in fear of the Federal government, but returned to Virginia some years before his death.

MASON, Jeremiah, American lawyer and politician: b. Lebanon, Conn., 27 April 1768; d. Boston, 14 Oct. 1848. He was graduated at Yale in 1788, admitted to the bar in 1791, and began to practise law at Westmoreland, N. H. In 1794 he removed to Walpole, N. H., and in 1797 settled at Portsmouth, where he lived for 35 years. At the New Hampshire bar, then the most famous in the country, Mason soon reached pre-eminence, among his fellow members being Daniel Webster and Jeremiah Smith. In 1802 Mason was appointed attorney-general of New Hampshire and in 1813 became a United States senator. He was a strong Federalist and took a leading part in the senatorial debates on matters relating to the War of 1812, his speech on the Embargo, delivered in 1814, and that on the Conscription Bill, 1815, being notable among public utterances of the time. In 1817 he resigned his seat to resume his practice, but afterward served for several terms as member of the New Hampshire legislature and rendered great assistance in the codification of the State laws. He removed to Boston in 1832 and practised in the courts until he reached 70, when he retired, with reputation fully maintained, to the more private work of his profession.

MASON, John, American colonist, founder of New Hampshire: b. King's Lynn, Norfolk, England, 1586; d. London, December 1635. In 1610 he served in the navy against insurgents in the Hebrides; in 1616 went as governor to Newfoundland, of which, in 1620, he published a description and in 1626 a map. In 1617 he explored the coast of New England; obtained in 1622 a grant of region called Mariana (northeastern Massachusetts); in the same year, with Sir Ferdinando Gorges, procured a patent for the province of Maine; and in 1623 sent a colony to the Piscataqua River. In 1629 he obtained a patent for the New Hampshire colony, also taking one with Gorges for Laconia, a tract including Lake Champlain. Among various prominent positions which Mason held in England was that of judge in Hampshire 1635, and in the same year he was appointed vice-admiral of New England. In 1691 his rights in New England were sold to Gov. Samuel Allen. Mason was buried in Westminster Abbey. New Hampshire became a royal province 44 years after Mason's death. Consult Tuttle, 'Memoir of Captain John Mason, the Founder of New Hampshire,' in an edition of Mason's description of Newfoundland (Boston 1887).

MASON, John, American colonial commander: b. in England, about 1600; d. Norwich, Conn., 1672. Under Sir Thomas Fairfax he served in the Netherlands; in 1630 settled at Dorchester, Mass.; in 1633 was appointed to a military command at Boston; and two years later joined with others in founding Windsor, Conn. In 1637 he was given command of an expedition of English and Indians against the Pequots (q.v.), whom he almost annihilated, completing their destruction in a second movement a little later. He removed first to Saybrook, and afterward to Norwich. For 30 years he was a major of the Connecticut forces, was a magistrate for many years and deputy governor 1660–70. From 1642 to 1668 he served as judge of the colonial court. His 'Brief History of the Pequot War,' written at the request of the General Court, was reprinted by Increase Mather in his 'Relation of Trouble by the Indians' (1677, republished by Prince, Boston 1736). Consult Ellis, G. E., 'Life of John Mason of Connecticut' (in Sparks' 'Library of American Biography,' Vol. XIII, Boston 1864).

MASON, John Mitchell, American divine b. New York, 19 March 1770; d. there, 26 Dec. 1829. His father was pastor of an Associate Reformed Church, and the son was graduated at Columbia College in 1789, and after studying theology under his father's care for one year went in 1791 to the University of Edinburgh. He was recalled in 1792 by intelligence of his father's death, and became his successor in his pastoral charge in 1793. He planned a theological seminary to be under the authority of his denomination, and visited Great Britain for the purpose of obtaining contributions; his pulpit efforts abroad gaining him repute there as one

of the first preachers of the time. The seminary being established in New York City in 1804, he was appointed its first professor of theology. In 1806 he projected the *Christian's Magazine*, which he conducted for several years, and in which he carried on a controversy with Bishop Hobart. In 1811 he became provost of Columbia College, and by his talents and energy raised that institution to a higher character than it had ever before possessed. In 1821 he exchanged his pastorate for the presidency of Dickinson College, Carlisle, Pa., and the next year entered the Presbyterian ministry. He was one of the great pulpit orators of his day and his discourses on the deaths of Washington (1800) and Hamilton (1804) are masterpieces of their kind. Consult the 'Life,' by Van Vechten (New York 1856).

MASON, John Young, American politician: b. Greensville, Sussex County, Va., 18 April 1799; d. Paris, 3 Oct. 1859. He was educated at the University of North Carolina; was admitted to the bar in 1819; became a judge in State and Federal courts; served several terms in the Virginia assembly; and from 1831 to 1837 was a member of Congress. Then till 1844 he was judge of the United States court for the district of Virginia, and in that year became Secretary of the Navy in the Cabinet of President Tyler. Although he served temporarily as Attorney-General under Polk, he re-entered the Navy Department. President Pierce, in 1853, appointed him Minister to France, and until his death he continued to fill this diplomatic position. With James Buchanan and Pierce Soulé (qq.v.) he signed the Ostend Manifesto (q.v.).

MASON, Sir Josiah, English pen manufacturer: b. Kidderminster, 23 Feb. 1795; d. 16 June 1881. He was the son of a carpet-weaver and at an early age began to earn his livelihood by hawking cakes and fruits in the streets. At Kidderminster he successively tried his hand at shoemaking, baking, carpentering, smithing, painting and weaving. In the midst of his avocations he taught himself to read and write. He removed to Birmingham in 1814 where he became a toymaker. He set up a shop of his own in 1824, turning out split key rings by machinery invented by himself; prospering in this venture he added the manufacture of steel pens in 1829. In the latter branch of industry he became the largest producer in England. In 1874 he transferred his interest to a limited liability company. Mason was also interested in electro-plating, copper smelting and india rubber ring manufacture with George R. Elkington. In 1860 he established a great orphanage at Erdington, upon which he expended $1,500,000. He was knighted in 1872. Mason College, now part of the University of Birmingham, was founded by him with an endowment of $1,000,000. Consult Bunce, J. T., 'Sir Josiah Mason: A Biography' (London 1882).

MASON, Lowell, American musician: b. Medfield, Norfolk County, Mass., 8 Jan. 1792; d. Orange, N. J., 11 Aug. 1872. His general education was small; in music he was self-instructed and wonderfully adept even when a boy, being choir leader in Medfield when 16, and a teacher in Savannah, where he removed in 1812. He came to Boston in 1827, was president of the Handel and Haydn Society there, and in 1832 founded the Boston Academy of Music. He visited Germany in 1837 in order to acquaint himself with improved methods in teaching music. In 1821 he published a collection of psalm tunes based on Gardiner's 'Sacred Melodies,' but including some of Mason's own compositions. He is best known for his hymn tunes, notably Cowper "There is a Fountain," and missionary hymn "From Greenland's Icy Mountains". Mason's more important publications were: 'Juvenile Psalmist' (1829); 'Lyra Sacra' (1837); 'The Psaltery' (1845); 'Carmina Sacra' (1841; new series 1852); 'Musical Letters from Abroad' (1853); 'Sabbath Hymn and Tune Book' (1859). Mason's musical library is now the property of Yale University.

MASON, Otis Tufton, American ethnologist: b. Eastport, Me., 10 April 1838; d. Washington, D. C., 5 Nov. 1908. He was graduated from Columbia University in 1861 and from 1861–84 was at the head of its preparatory school. From 1884–1908 he was curator of ethnology at the United States National Museum. He was a member of various scientific societies and published 'Cradles of the American Aborigines' (1889); 'Woman's Share in Primitive Culture' (1894); 'The Origin of Inventions' (1895); 'Indian Basketry' (2 vols 1904). He was coeditor of the 'Standard Dictionary' and edited the anthropological department of the *American Naturalist.*

MASON, Rufus Ogden, American physician: b. Sullivan, N. H., 22 Jan. 1830; d. New York, 1903. He was graduated from Dartmouth College in 1854 and from the College of Physicians and Surgeons in New York in 1857. During the Civil War he was an acting assistant surgeon. He was almost as well known as an author as he was a physician and among his books are 'Sketches and Impressions, Musical, Theatrical and Social, Including a Sketch of the Philharmonic Society of New York' (1887); 'Telepathy and the Subliminal Self' (1897); 'Hypnotism and Suggestion in Therapeutics' (1901).

MASON, Stevens Thomson, American politician: b. Leesburg, Va., 27 Oct. 1811; d. New York City, 4 Jan. 1843. He was the son of Gen. John T. Mason of the noted Mason family of that State. He received his education at Transylvania University, Lexington, Ky., to which place his father had removed in 1811. On 12 July 1831, when not 20 years of age, he was appointed secretary and acting governor of the Territory of Michigan, a position he continued to occupy until 8 Sept. 1835. The death of George B. Porter, the territorial governor during his term, left Mason for several years the actual governor. Although vigorously opposed by the people of the Territory at the time of his appointment on account of his minority, his stand in the controversy with Ohio known as the Toledo War, brought him such popularity that he was unanimously chosen governor by the people upon the adoption of the constitution by the State on 2 Nov. 1835, a position to which he was re-elected in November 1837. In 1840 he removed to New York City to take up the practice of law. On 4 June 1905 under the authority of the Michigan legislature his remains were transported from New York

and reinterred in Capitol Park, Detroit, the site of the first capitol of the state.

He is known in the history of Michigan as the "Boy Governor," as he was the youngest person ever appointed to so important an executive position in the history of the nation.

MASON, Walt, American humorist and poet: b. Columbus, Ont., Canada, May 4, 1862; d. La Jolla, Calif., June 22, 1939. He came to the United States in 1880 and, after joining William Allen White on the Emporia (Kans.) *Gazette,* he became well known for his prose poems, which appeared daily in more than 200 newspapers. His principal works were *Uncle Walt* (1910); *Horse Sense* (1915); *Terse Verse* (1917); *Walt Mason, His Book* (1918).

MASON, William, American musician: b. Boston, Jan. 24, 1829; d. New York, July 14, 1908. He was the son of Lowell Mason and studied music extensively abroad. Having toured Europe and America as a pianist, he established in 1855, with Theodore Thomas and others, the Mason and Thomas recitals of chamber music, which were continued until 1868. Among his works are many piano compositions and several nstruction methods.

MASON, William, English poet: b. Hull, Feb. 12, 1724; d. York, April 7, 1797. He was educated at Cambridge and his first publication was *Isis,* a poem satirizing the Jacobitism and the high church principles which prevailed in the University of Oxford. In 1752 he published *Elfrida,* a tragedy with choral odes on the ancient Greek model. Having taken orders in the church, he was appointed chaplain in the rectory of Aston in Yorkshire in 1754, a position which he resigned in 1773. In 1759 appeared *Caractacus,* another drama on the model of Greek tragedy. Some years afterwards, he was made precentor and residentiary canon at York.

One of Mason's principal works, the poem, *English Garden,* appeared between 1772 and 1782 and was translated into French and German. In 1775 he published the poems of his friend Thomas Gray, with memoirs of his life. His principal subsequent publications were *Odes; Life of William Whitehead,* with his poems (1788); and *Essay on Church Music* (1795).

MASON, city, Michigan, seat of Ingram County, 12 miles south-southwest of Lansing on U.S. Highway 127 and the Michigan Central Railroad. Altitude 886 feet. Situated in a farming area, Mason produces beans, cabbage, and dairy products, and manufactures pharmaceuticals. The city has a public library, and a historical museum is maintained in the courthouse. Nearby is a state game farm.

Mason was named for Stevens Thomson Mason, the first governor of Michigan. Settled in 1837, Mason was incorporated as a village in 1840, and became a city in 1868. It has a mayor-council form of government. Pop. (1950) 3,514.

MASON AND DIXON'S LINE (also Mason-Dixon Line), in American history, the boundary line in lat. 39° 43′ 26.3″ north, between Maryland and Pennsylvania, surveyed by Charles Mason and Jeremiah Dixon between 1763 and 1767 in settlement of the dispute between the Baltimore and Penn families, respectively, the proprietors of Maryland and Pennsylvania. Before the Civil War the line came to designate the boundary or division line between the free and the slave states east of the Ohio. Popularly, it has come to mean the dividing line between the North and the South.

MASON BEES, a name given to the small wild bees of the genera *Osmia* and *Chalicodoma,* which construct their nests with sand or gravel, agglutinated together by means of a viscid saliva, and fix them on the side of walls, under stones, within the hollows of plant stems whence the pith has been removed, or avail themselves of some other cavity for that purpose. The mason bees, like the carpenter bees, leaf cutters and other allied forms of the family Megachilidae, are solitary in habits, not living in communities, although groups of cells are usually found near together, made by the same mother bee, and each containing a single egg and food—a mixture of honey and pollen.

MASON CITY, city, Iowa, seat of Cerro Gordo County, 65 miles northwest of Waterloo on Lime Creek at the junction of U.S. Highways 18 and 65. The following railroads serve the city: Chicago Great Western; Chicago, Milwaukee, St. Paul, and Pacific; Chicago, Rock Island, and Pacific; Chicago and North Western; Minneapolis and St. Louis; and Mason City and Clear Lake. A municipal airport also provides airline service. At an altitude of 1,130 feet, Mason City is in a grain, dairy, and livestock region. Beet fields in the surrounding area are cultivated by hand, to a great extent by Mexican laborers. Nearby are clay, shale, and limestone deposits. The chief industrial products are portland cement, brick and tile, processed meat, and beet sugar. Other industries include creameries, fertilizer and refrigerator manufacture, and some machine shops.

Nine miles west of Mason City is Clear Lake State Park, a scenic resort with a lake seven miles long and three miles wide. The Mason City Junior College (1918) was the first such school in the state and has a music department noted for the excellence of its band and orchestra. The city maintains a $300,000 public library in a seven-acre wooded tract.

The first settlement here was by freemasons in 1853. Laid out in the following year, the community received its first charter in 1870, became a city in 1881, and received its present charter in 1916. A mayor and council administer the government. Pop. (1950) 27,980.

MASONIC FRATERNITY (Freemasonry or Ancient Free and Accepted Masons), generally conceded primacy among fraternal orders, is disseminated over the civilized world. It has no central authority, being divided into more than one hundred grand jurisdictions, each autonomous, in addition to which there are several large and widespread concordant orders or so-called "higher degrees." The main stem, variously referred to as "Ancient Craft Masonry," "Ancient York Masonry," "Symbolic Masonry," or the "Blue Lodge" consisting of three degrees, the Entered Apprentice, Fellow Craft and Master Mason (and, historically, the essentials of the Royal Arch, though the latter is not now generally considered included), is probably directly descended from the fraternity and lodges of operative stonemasons and cathedral builders of the Middle

Ages, which gradually at first, but, definitely and permanently in the early 18th century A.D., became exclusively speculative in character. Freemasonry is cosmopolitan and democratic, bearing upon its rolls the names of the nobility, statesmen, scholars, and others of high rank but a much larger number of the middle class. It admits men of every nationality, religion, creed and political persuasion, the qualifications for membership being few, such as belief in God as the Great Architect of the Universe, good moral character, a fair degree of intelligence, and absence of maim or defect in body which would prevent the candidate from performing his duties as a Mason. By long-continued custom, the society refrains from solicitation of candidates; all who enter must do so unbidden and of their own free will and accord. The essential teachings of the craft are few and simple, illustrated by the symbolism of the working tools such as the plumb, square, level, compasses and other symbols, though many embellishments and refinements have been adopted in the so-called higher degrees and are often embraced in Masonic literature, so that, to some, the doctrine has become highly spiritual, though the fraternity rejects all suggestion that it is a religion or rivals any religious sect.

Antiquity.—During the 18th and first half of the 19th century, Masonic writers laid great stress upon the possible origin of the society in the remote ages of the past. Absolutely without any historical basis of record as were most of these theories, yet men of learning loaned their influence to perpetuate the fables extant concerning the fraternity. Some asserted (1) that the history of the race was the story of Masonry, beginning with the migration from the Garden of Eden; others (2) that it sprang from the Patriarchal period; and still others contended (3) that the society was the successor of the ancient mysteries of the Orient; (4) that the Temple of Solomon was its cradle; (5) that the Crusaders and the Knights Templar carried it forward from their times; (6) that the Roman colleges of artificers and builders of the Middle Ages handed down the craft to posterity; (7) that the civil strifes in Great Britain of the 15th and 16th centuries, and subsequent political events, made the institution possible; (8) and a later class of writers placed the origin to the credit of the Rev. James Anderson, D.D. and the Rev. John Theophilus Desaguliers, L.L.D., F.R.S. and their compeers of «The Revival of 1717 A.D.» Several of these authors changed their views later in life; and, during the past 50 years, the intelligent Masons of Great Britain and the United States have attempted to build up from the broken fragments of the past—contained in fugitive lodge records and old constitutions extending back more than three centuries—a reasonable history of the «operative» Masonry of the British Isles and the continent of Europe, as well as that of the present «speculative craft.» In this effort, assistance has been rendered by scholars not connected with the fraternity. The critical reader will note in the enumeration above that many plausible theories might be founded, both on history and legend, but the strongest factor in the appeal to antiquity, nevertheless, is the «Legend of the Third Degree.» In one form or another, the allegory of the fall of man, the sacrificial redemption of the race, the doctrines of the resurrection and immortal life, permeated the peoples of every age and became the motive of many migrations. When, therefore, a society arose which claimed to solve some of these mysteries—nay, even to have descended from those periods—it is not singular that the order should have attracted disciples; especially when shielded from public gaze by a veil of secrecy, the universality of the printed page not having yet been established.

Origin in Great Britain.—The majority of modern opinion holds that Freemasonry of the present day, that is to say, that of the symbolic or «blue lodges,» had its origin in the British Isles, probably in medieval times and, therefore, peculiar interest centers in the history, legends, and constitutions of the fraternity in that quarter. The heyday of the operative cathedral builders rapidly waned after the Lutheran reformation of 1517 by reason of the decline in the construction of church edifices, so that our first glimpse into lodges in Scotland follows by some three quarters of a century the culmination of operative prosperity, though the Old Constitutions of the English Freemasons carry our knowledge back some two centuries further. The earliest lodge minutes in Scotland are those of the Lodge of Edinburgh for July 1599, and those of the following year show that the lodge had already begun to admit «accepted» Masons, that is, gentlemen or theoretic Masons, not of the stonemasons' trade or of any trade but of the gentry and nobility. Other lodge records show the presence of this class in Scotland variously between 1652 and 1696. The earliest English lodge records we know of are those of Alnwich Lodge of 1701 and York Lodge for 1705, though the existence of other lodges is attested by extraneous evidence; for example, the diary of Elias Ashmole, a prominent scholar and antiquary of that day, who records that he was made a Mason at Warrington in Lancashire in 1646, and Dr. Plot's statement in 1686 that the society was spread more or less over the nation. Fortunately, there have been preserved a most informative group of old parchments, some in book form and some in rolls, containing the fundamentals of the English craft, that is, the legends and charges. These are the «old charges» or «Gothic Constitutions,» the oldest of which, the Regius or Halliwell MS., lay in the British Museum for many years cataloged as «A Poem on Moral Duties.» It is undated but antiquaries ascribe it to about the year 1390. The next oldest, also in the British Museum, is the Matthew Cooke MS. of early 15th century production. About eighty similar MSS. are preserved, some dated, others evidencing origins through the 16th and 17th centuries. They have been classified into families, each family including those either copied one from the other or evidencing close relationship. Though variations exist amongst families, and to a lesser extent amongst those of the same family, the framework and substance of all are the same, the differences being much as though the contents had been committed to memory and transmitted orally, so that, when occasionally reduced to writing, faulty memories produced divergent results. Each consists of three main parts: (1) the invocation, (2) the legends, and (3) the charges.

The invocation or declaration of faith is usually of Christian character, the following being an example contained in a version of 1583

in possession of the United Grand Lodge of England:

The mighte of the Father of Heaven and y^e^ wysdome of ye glorious Soone through y^e^ grace & y^e^ goodnes of y^e^ holly ghoste, y^t^ bee three psons & one God, be w^h^ vs at o^r^ beginning and give vs grace so to govrne vs herein or lyving that wee maye come to his blisse that nevr shall have ending. AMEN.

The legendary portion purports to account for the origin of Geometry or Masonry, (those terms being used synonymously), before the Flood and the preservation of the science by its having been written on two pillars, one of which would not burn in fire and the other of which would not drown in water. It was then carried into Egypt where Euclid espoused and taught it to the Egyptians. Pythagoras is said to have made much use of it. The building of King Solomon's Temple and the part played by Masons and Masonry is recorded; (whence the Temple legend and allegory in modern rituals). The science is next said to have been carried into France where it came under the protection of Charles Martel, and thence it was carried into England in the time of St. Alban. This apocryphal history then recites that the Masons received the patronage of Prince Edwin and King Athelstan, the latter of whom called a national assembly of the craft at York where he gave them charges (a charter) authorizing yearly assemblies.

The charges vary in number, sometimes 15 for the Masters and a like number for the workmen, in other MS, 25 for all without discrimination, and various other numbers and arrangements. These charges enjoin adherence to the church, honor and morality, discharge of just obligations, the performance of honest work for fair wages, loyalty to the King and abstinence from plots and conspiracies, secrecy of counsel within and without the lodge, mutual respect, aid and assistance amongst the craftsmen, seven years apprenticeship, certain standards of character and bodily integrity as prerequisites for apprenticeship, abstinence from gaming or lewd company, attendance upon the annual assembly, and other provisions of like kind, all with some variety of language and arrangement amongst the various MSS. Most of the known copies are of English origin and, while they do not afford the same insight into the lodges as do the minutes of lodges in the North, the oldest are approximately two centuries anterior and are generally accepted as the formulae used in the ceremonies of admitting apprentices to the lodge. They also form the basis, as closely as speculative uses permit, of the present day rituals, customs and laws of the society.

The credit for the conception of the Gothic structures which abound throughout the British Isles and Western Europe, and which were erected in the 400 years between the 11th and 16th centuries, as well as the identity of the architects thereof, has never been settled. Even the application of the name Gothic to this style of architecture is unaccounted for, every nation of that name having disappeared several centuries before the first example was erected. Old records, more recently discovered, and examined in the light of present-day research, have led Masonic writers to revise their formerly accepted assertion that the cathedrals and other public edifices of the Middle Ages were planned by church dignitaries. The opinion now obtains that the Master Masons of that period were the architects. Performing the work under the guidance of the Master and closely guarding the mystery of the craft were the Fellows and Apprentices. Each workman placed his mark upon the stone fashioned by him so that it could be identified and his wages paid accordingly. Innumerable examples of these marks are found in structures of the period. The early records indicate that the living quarters or tiled lodges were used as places of instruction and communication of the mystery of the craft, strict secrecy being enjoined to preserve the monopoly and particularly to prevent encroachment by «cowans,» that is, masons of meaner accomplishments such as brick and rough masons and possibly even including some of more eminent ability who did not conform to the charges or, as it was expressed in Scotland, who lacked the «Mason Word.» The status of the «accepted» or gentlemen Masons during the years of operative pre-eminence is not clear, but it is certain that the practice of admitting them was by no means exceptional during the 16th and 17th centuries and that, by the beginning of the 18th century, the lodges contained a considerable theoretic element which, in some instances, predominated. It has been shown that, of those named by Elias Ashmole as present in the lodge at Warrington in 1646, not one was a working stonemason. To this peculiar custom is unquestionably due the preservation of the society during the period of transition from operative to speculative Masonry, a period of more than a century, during which English lodges diminished in number (we positively know of only six or seven with intimations of four or five more in the early years of the 18th century), and during which the lodges in Scotland, though keeping up their existence, had been reduced in importance and activity. It was these «accepted» or theoretic Masons who conceived and carried through the speculative reorganization of the society in 1717. The term «speculative» is not confined to those who founded the Grand Lodge of England or their successors, for they were of the same kind and in some instances the same individuals who were «accepted» prior to that event. We do not know, however, to what extent they had theretofore indulged in the study of symbolism or moral science. While lodges of the ancient period were chiefly operative, there were even then speculative members. According to the old Masonic MSS., Prince Edwin was «of the Speculative part, a Master,» and the Regius MS. of about 1390 mentions lords, dukes, earls, barons, knights and squires, as members. Probably due to decline in cathedral building, the operative element diminished and the speculative feature grew until, at the Revival of 1717, the latter was greatly in the ascendant. Prior to and even for a time following that event, there seems to have been some rivalry between the two elements, but the trend of events favored the speculatives and they soon became entirely predominant, the operative membership gradually disappearing. We do not know to what extent signs, tokens, words, and other modes of recognition were used prior to 1717, but some of the old MSS. indicate that they had a place. Also, the «benefit of the Mason Word» appears in the Scots records, and the Melrose MS. of 1581 (known to posterity by the transcript of 1674) refers to «ye privilege of ye compass, square and level, and ye plum-rule.» Extraneous documents refer to secret modes of

recognition, and Dr. Plot, writing in 1686, mentions their existence quite positively. Despite lack of evidence, persistent efforts, entirely fanciful, have been made repeatedly to identify Freemasonry in some more or less close association with the Rosicrucians, the Alchemists, and the Hermetic philosophers. It can only be said that many secret societies have, from time to time, sprung up, some imitating and some pretending to rival the Masonic institution, but if there is a character of the order stronger than any other, it is its consistent aloofness from association with, or recognition of, any other order or organization, and its persistent repugnance to innovations.

The Grand Lodge Era.—In 1716, as we are informed by Dr. James Anderson, the «historian of the Grand Lodge,» the members of four old London lodges, together with some old brethren, met and, having put into the chair the oldest Master Mason, they constituted themselves a Grand Lodge pro tempore, forthwith, revived the quarterly communication of officers of lodges, and resolved to hold the annual assembly and feast, and then to choose a Grand Master. Accordingly, on St. John Baptist's Day, 24 June 1717, at the assembly and feast, Anthony Sayer, gentleman, was installed Grand Master. In 1721 the Duke of Montague, Grand Master, instructed Dr. Anderson, with a committee of 14, to collect all the old documents of the craft and digest them in a new and better method. This work, consisting of an elaboration of the old legends, the revised «Charges of a Free Mason» and a code of General Regulations, which had been adopted in 1722, was completed, approved, and published in 1723 and is usually known as «Anderson's Constitutions of 1723.» This movement, though called the «Revival of 1717,» because it was the asserted reinstatement of the legendary General Assembly mentioned in the Gothic Constitutions, was something more; it was also a reorganization. The Grand Lodge assumed jurisdiction over existing lodges in and about London and Westminster which accepted the new regime, and forbade the formation of new lodges by its adherents without its consent; stated annual and quarterly communications were scheduled; the lodges abandoned all efforts to regulate the building trade and devoted themselves to speculative moral science; degrees, rituals and lectures, theretofore rudimentary, were formulated or perfected; the old charges were revised and unified; elaborate regulations were adopted, and lastly, the exhortation in the Ancient Constitutions «to love God and Holy Church» was modified by obligating the Mason only «to that religion in which all men agree, leaving their particular opinions to themselves; that is to be good men and true, men of honor and honesty.» Two clergymen, Dr. James Anderson (b. Edinburgh, 5 Aug. 1684) and Dr. John Theophilus Desaguliers F.R.S. (b. France, 12 March 1683), the third Grand Master, together with George Payne Esq., who occupied the position for the second and fourth years of the organization, are supposed to have been the most influential in the movement, though none of them are known to have instigated the step. Dr. Anderson, 15 years later, published his «Constitutions of 1738.» From the time of its creation, the premier Grand Lodge flourished, many new lodges were formed, its scope of jurisdiction gradually expanded, and applicants in increasing numbers knocked at the doors of the lodges. There was not abse however, a considerable dissenting element a hering to the old customs and distrusting the n order and also several rival and disparagi orders which enjoyed but short existences unc the names of Antediluvian Masons, Honora Masons, Apollonian Masons, Real Masons, Mo ern Masons, Philo-Musicae et Architecturae S cietas Apolloni, Scald Miserable Masons, t Ancient Noble Order of the Gormogons, t Order of Gregorians and the Noble Order Bucks. York Masonry, by reason of the leger ary first General Assembly, called there by Ki Athelstan, enjoyed some pre-eminence in repu tion, which was possibly the inducement for Yo Lodge, in 1725, to meet not only as a priva lodge but also as a «General Lodge.» It cho a Grand Master and called itself the «Gra Lodge of All England.» This ambitious ente prise was tolerated by the premier Grand Lod but became dormant after about 20 years. R vived in 1761, it lived for about 30 years mo during which, in 1779, it constituted a disaffect branch of Lodge of Antiquity the «Grand Lod of England South of the River Trent,» whi survived only until 1790. In 1770, a «Supre Grand Lodge» was formed, it is thought by Sco Masons, but expired about 1775. By far t most important of the dissident bodies arose 1752 in the «Grand Lodge of England Accordi to the Old Institutions,» commonly called t «Ancient» Grand Lodge, or «Athol» Gra Lodge, because of the long Grand Mastershi of the two Dukes of Athol, father and son. Th movement, for many years, ranked as the «Gre Masonic Schism,» but more recent investigatio have shown that it was instituted by Irish M sons residing in London, few of its members, any, having belonged to the older branch, up which the name «Moderns» became firmly a tached. The Ancients steadfastly asserted, main through their energetic and contentious Gra Secretary, Laurence Dermott, throughout the years of their separate existence, that the Mo erns had departed from the «Landmarks» of t Craft and, therefore, that the former was t true and ancient rite. The changes alluded t though of minor character, were sufficient to p the premier Grand Lodge on the defensive, a the Ancients, conferring in their lodges the Roy Arch Degree, a very popular working, we through the latter part of the 18th centu rapidly overtaking the older rival in both Gre Britain and America, and actually seemed to preferred by the Grand Lodges of Ireland a Scotland. Traces of this divergence are st found in America and elsewhere, some Gra Lodges bearing the name Free and Accepte Masons while about an equal number, Ancie Free and Accepted Masons, although these nam do not always indicate the line of descent, beir sometimes chosen as a matter of taste. At a times painful to the leaders of each of the tw branches, the estrangement was brought to happy ending on St. John's Day, 27 Dec. 18 by their most harmonious merger into th «United Grand Lodge of Ancient Freemasons England,» the governing body of English Fre masonry at the present day. It was, thereupo declared «that pure Ancient Masonry consis of three degrees and no more, viz., those of th Entered Apprentice, the Fellow Craft, and th Master Mason, including the Supreme Order the Holy Royal Arch.» The inclusion of the la

amed was a victory for the Ancients, because he Moderns, though conferring the degree in a Chapter,» did not recognize it as part of the raft degrees. In time, however, the Royal Arch as separated from the Grand Lodge and administered under the jurisdiction of the chapter, nough its three principal officers are identical ith those of the Grand Lodge.

In Scotland.—The honor of seniority mongst lodges has been the subject of much ispute in Scotland, the determination by the rand Lodge first giving Lodge of Edinburgh ie rank of No. 1. Later, «Mother» Kilwinning odge was preferred but, in order not to disturb ie numbering of other lodges, the rank of No. 0 as accorded it. Meanwhile, other old lodges ad also been designated as No. 1, and for like easons suffixes were added so that we have odge of Melrose St. John No. 1 (bis) and odge of Aberdeen No. 1 (ter). The oldest inutes now extant of these four lodges are ated: Edinburgh 1599, Kilwinning 1642, Aberen 1670, and Melrose 1674, but extraneous cords show all of them to be much older, some ssibly reaching back to the 12th century. Other d lodges are: Scoon and Perth No. 3; Glasw St. John No. 3 (bis); Atcheson-Haven xtinct in 1866); and Ancient Lodge No. 49 Dundee, all antedating 1650. The lodges in cotland were all operative in character, but merous records through the 17th century stify to the admittance of nonoperative mems. On St. Andrew's Day, 30 Nov. 1736, the ample set in England and Ireland was followed by the formation of the Grand Lodge of cotland, though several lodges maintained their dependent existence long after that date. Lodge Glasgow St. John No. 3 (bis) not only deined to join the Grand Lodge for many years, it refused to admit nonoperative Masons until 42. The first Grand Master, Baron William Clair of Roslin (Earl of Orkney and Caithss), was followed by the Earl of Cromarty. cotland's «Masonic gem» is the «Prentice's Pilr» in the chancel of Roslin Chapel, Edinburgh.

In Ireland.—Traces of the craft in Ireland e few and obscure prior to 1726, though extraious references demonstrate that it was well own as early as 1688. The earliest minutes are ose of 8 Dec. 1726, in a book recording the oceedings both of a private lodge at Cork and a Grand Lodge in the Province of Munster. he London *Journal*, 17 July 1725, mentions an ish Grand Lodge and, in that year, Anderson's onstitutions were advertised for sale by Dublin okstores. The Grand Lodge of Ireland was rmed at Dublin apparently 3 Feb. 1728, though earliest minutes were destroyed under circmstances never satisfactorily explained. Lord ingston, who had been Grand Master of Engnd in 1729, was made Grand Master of the ish Grand Lodge in 1730, and again in 1735 d 1745. From 1747, Irish Masonry prospered ore than formerly. A curious tale, accepted some, doubted by others, has it that The on. Elizabeth St. Leger, then a girl of 20 ars, who afterwards married Richard Aldorth, having been discovered spying upon a asonic lodge, was initiated in order to assure r retention of the secrets. The tale arose some ars after the supposed event, the scene is laid in rious lodges, and the character of an initiation not specified, but a portrait of the lady, clothed a Freemason, hangs in many Irish lodgerooms, and her apron is preserved, thus assuring her standing in the opinion of some as the «only female Freemason.»

On the Continent.—Attempts to connect the building crafts of Continental Europe with speculative or symbolic Freemasonry have signally failed. Both the German *Steinmetzen* (stonemeasurers) and the French Masons produced works comparable to the Freemasons of Britain and maintained societies not unlike those in the Isles. Strangely enough, our first documentary introduction to the *Steinmetzen* (Constitutions of 1459 and Torgau Ordinances of 1462) closely approximates the dates of the earlier Gothic Constitutions and, more interesting yet, is the fact that the two are in substance quite similar, some precepts being in practically identical terms. Less is known of the French craft (Les Compagnons du Tour de France) virtually all of our information coming from the book published in 1841 by Agricol Perdiguier. It is possible that the disintegration of the German and French operative craft was followed by short-lived nonoperative societies but they did not develop into Masonic lodges, nor did York Rite Masonry, upon its introduction into the Continental countries (France about 1726 and Germany somewhat later) encounter any societies which were recognized as even remotely related to it. Freemasonry, as adopted into Germany, soon became divided into at least three Grand Lodges, one of them adopting Christianity as its doctrine, and all of them to some extent permeated by sectarian discord. Less peaceful yet was the career in France, where the Grand Orient, to the disheartenment of British and American Grand Lodges, subjected itself to criticism on five points: (1) its organization and degrees which included four above the three craft degrees; (2) a connection with Co-Masonry (female); (3) political disputes; (4) religious differences; and (5) invasion of other jurisdiction by chartering lodges therein. Up to 1849, the Grand Orient had made no declaration respecting a belief in Deity as a condition for membership, but followed Anderson's Constitutions of 1723, which were either negative or indefinite upon the subject. Yet, the Grand Orient was recognized as regular by all other Grand Lodges. On 10 Aug. 1849, that body declared that «Freemasonry has for its principles the existence of Deity and the immortality of the soul,» which remained in effect until 14 Sept. 1877 when the declaration was changed to read: «Masonry has for its principles mutual tolerance, respect for others and for itself, and absolute liberty of conscience.» Most British and American Grand Lodges, soon thereafter, severed fraternal relations with French Masonry, not, however, as sometimes stated, solely because of this action but rather because it was the culmination of a long series of irritations. For 20 years prior to the outbreak of the Second World War, there was much sentiment, particularly in England, for the restoration of concord with the Grand Orient. In Scandinavian countries, Freemasonry has taken on peculiar characters, though generally recognized as regular. Kings of these lands are the hereditary Grand Masters, the doctrine is Christian, and the rite is a peculiar combination of portions of the York and Scottish degrees.

In Russia, Freemasonry first appeared toward the end of the 18th century, the body of

its membership being composed of the aristocracy. Its influence is vividly set forth in Tolstoy's *War and Peace* dealing with the War of 1812 (Napoleon's invasion of Russia). During the reign of Czar Nicholas I (1825–55), Masonry was put under the ban because of religious and political difficulties, particularly the mutiny of the officers of the Guard, known as the Decembrists, in 1825, in which many prominent Masons participated. Thereafter, Masonry existed as an underground order until the 1860's. There has been no evidence of the order in Russia subsequently, though several times it has been suspected to exist.

In other European nations—Spain, Portugal, Italy, Greece, Austria, Poland, Czechoslovakia, and the Balkans—Freemasonry has often enjoyed periods of peace and prosperity and has attracted men of superior attainments only to have its career checked or interrupted by religious or political persecution, which, after all, is not unnatural in view of the wide gulf between Masonic liberality of belief and conscience and the diametrically opposed religious and political institutions established amongst those peoples long antecedent to the importation of Freemasonry.

In America.—Jonathan Belcher, governor of Massachusetts, was made a Mason on a visit to England in 1704 and is the first Freemason known to have been in the Western Hemisphere. Some of the first lodges in the colonies were held under the immemorial right of Freemasons under the Old Constitutions to meet in lodges anywhere that five or six brethren could be assembled, just as the similar right was acted upon in England by the Old or St. John Masons for some years after the formation of the Grand Lodge in 1717. Such a lodge seems to have been held at Fredericksburg, Va., as late as 22 Dec. 1753, conferring on that date both the Entered Apprentice and the Royal Arch Degrees. The primacy of lodges in the United States is disputed between Boston and Philadelphia, the contest revolving around questions not only of priority between duly chartered lodges but even as to the holding of lodges without charters under immemorial right. Boston claims an immemorial right lodge, without clear proof, as early as 1720, but it is well settled that such a lodge, perhaps several, existed at Philadelphia as early as 1730, for Benjamin Franklin was made a Mason there in February 1730. On 5 June 1730, Daniel Coxe of Burlington, N. J., was appointed by the Duke of Norfolk, Grand Master of the premier Grand Lodge of England, Provincial Grand Master for New York, New Jersey, and Pennsylvania. On 13 or 30 April 1733, Lord Montague, Grand Master of the Grand Lodge of England, issued a like deputation to Henry Price of Boston covering New England. There is no evidence that Coxe acted under his deputation at all, but it is clear that Price formed a Provincial Grand Lodge in Boston 30 July 1733, and the same day constituted the First Lodge of Boston which, some years afterwards, consolidated with two others and is now St. John's Lodge. The Pennsylvania Masons under the Grand Mastership of Benjamin Franklin petitioned Price, whose jurisdiction was reputed to have been extended over all of North America, for a charter for a Grand Lodge which was reported, probably incorrectly, as granted 21 Feb. 1735. The supposed superiority of chartered lodges as against the informal lodg held under the Old Constitutions or immemor right seems to depend upon the regulations the Grand Lodge of England approved 24 Ju 1721 forbidding the formation of a lodge witho the Grand Master's warrant, but regard must given to the fact that those regulations and, i deed, all the pretended jurisdiction of the Gra Lodge of England were expressly limited lodges in London and Westminster together wi such others as voluntarily joined the Gra Lodge. Several lodges in England and Scotla maintained their independent existence for so years after the formation of the Grand Lodg in the respective kingdoms. Hence, an i memorial right lodge in America may have be as legitimate as a warranted lodge, and the r spective claims of the Massachusetts and Pen sylvania brethren may be considered by othe a mixed question of law and fact still und termined. Charters for other lodges in t Americas, issued by both the Moderns and t Ancients were especially prolific after the midd of the 18th century. To these must be add charters issued by the Grand Lodges of Irela and Scotland, both of which were active in t spread of Freemasonry, not a little augment by army or regimental lodges in practically of the armed forces of the period. Among t many prominent men who belonged to the fr ternity in the formative period of the nati besides Franklin, were Washington who w made a Mason in the lodge at Fredericksbur Va., and became Master of the lodge at Ale andria, Va.; Monroe, Fulton, Montgomery, Bu Paine, Hamilton, Sherman, Rush, Whipp Gerry, Stark, Livingston, Warren, John Pa Jones, Witherspoon, Revere, Hancock, Lafayet Steuben, De Kalb; and later, Jackson, Pol Fillmore, Buchanan, Johnson, Garfield, McKi ley, Taft, Harding, Theodore Roosevelt, Fran lin D. Roosevelt and Harry S. Truman we identified with the craft.

In Other Countries.—Freemasonry, at va ous times, has spread into practically all civiliz nations, Grand Lodges now existing in the pro inces of Alberta, British Columbia, Ontari Manitoba, New Brunswick, Nova Scotia, Prin Edward Island, Quebec, and Saskatchewan, Canada; New Zealand, New South Wales, Vi toria, South and West Australia, Tasmani Queensland, the Philippines, Mexico, Puer Rico, Cuba, and Central and South America. the Continent of Europe during the Seco World War, Freemasonry was suppressed became virtually extinct, except in Swede Switzerland and possibly Portugal.

Statistics.—The United States stands pr eminent in its patronage of the society, havi 49 Grand Lodges with something over 15,5 subordinate lodges and approximately 2,500,0 members. In the rest of the world, there a some 60 Grand Lodges with about 11,000 su ordinate lodges and 1,000,000 members, not i cluding a score or more of Grand Lodges whic with their subordinate lodges, have been su pressed or extinguished on the Continent Europe, in the Philippine Islands, and in Chi These figures do not include the so-called high degrees of the York Rite or the Scottish Rite.

Supplemental Degrees and Orders. Within two decades following the formation the Grand Lodge of England, two classes of s called higher degrees began to be worke

(1) those apparently of English origin which ttached themselves to York or Craft Masonry, nd (2) those of Continental origin constituting he Scottish Rite, founded upon, but more or ess independent of, the British craft.

The first of these was the Holy Royal Arch, he essentials of which probably existed prior to 717. Though not recognized officially by the remier Grand Lodge, it came to be conferred y the lodges as a degree designed to complete he Third Degree, being conferred only upon Masters of lodges. The author and origin of he ritual are unknown but the Chevalier Anrew Michael Ramsey has been credited with its reation. Coming into the Masonic system someime between 1730–50 and before the Third Deree was worked in all lodges (those which conerred it being called «Master's Lodges»), the Royal Arch became very popular and the especial ride of the Ancients who considered it an inispensable part of the craft working. The Moderns, while not recognizing the degree as a art of Craft Masonry, conferred it in «Chapers.» The first lodge records showing the orking of the degree are those of Sterling Rock odge in Scotland for 30 July 1743 (their verity uestioned); and in America, the minutes of a odge at Fredericksburg, Va., in 1753. At the Union of the Ancients and Moderns in 1813, the Royal Arch was declared to be a part of pure ncient Masonry, though it was soon segregated nder the administration of the Grand Chapter, he principal officers of which are the same as hose of the Grand Lodge. The Mark Master, ast Master and Most Excellent Master Derees which are, in America, under the Royal rch Chapter, are of later origin, the last named ossibly the work of Thomas Smith Webb in merica. These several Chapter degrees are alled «Capitular Masonry.» The further derees of Royal and Select Masters are known s the «Council» or «Cryptic Masonry.» The rder of Knights Templar, the only avowedly hristian element in the whole galaxy of degrees, s theoretically derived from the Crusades and many attempts have been made to show an actual onnection, chief among which is the theory f the «Baldwin Encampment,» based on the ancied association of the Freemasons with the rusaders as builders of strongholds, priories, nd round churches of which the famous Temple hurch, London, is an example; then, the supposed flight of the surviving knights to the rotection of Freemasons in Scotland, following he martyrdom of Jacques de Molai, the last rand Master, executed 11 March 1314. But the ask of supplying the 400 years of history beween the dispersion of the Templars and the rst record of the modern order has proved impossible, so that the order must be deemed one f the additions made to the Masonic system in he latter half of the 18th century. The first ention of the Knights Templar in Masonic ecords occurs in the minutes (lodge warrant) f St. Andrew's Royal Arch Chapter, Boston, lass., 28 Aug. 1769; the earliest in England in hose of Phoenix Lodge No. 257, Portsmouth, 21 ct. 1778. On 8 Oct. 1779, the Earl of Eglinton, aster of Kilwinning Lodge (Scotland) warranted the «High Knights Templar of Ireland at ublin.» The records of the «Grand Lodge of ll England» at York show that in 1779 the oyal Arch and the Order of Knight Templar ere conferred as the 4th and 5th degrees, respectively. That order with the Order of the Red Cross and the Order of Malta comprise «Chivalric Masonry.» Of these supplemental York Rite degrees and orders, the Council degrees, the Past Master and Most Excellent Master Degrees and the Order of the Red Cross are not conferred in Great Britain and the «Commandery» is there the «Preceptory» not using the American rituals. Also the Mark Master is there not under the administration of the Royal Arch Chapter but constitutes a separate order. Such differences have led some to use the coined term «American Rite» to describe the working in the United States but without clear specification whether only the supplemental degrees or the whole Masonic system is included. The term seems to have originated with Dr. Albert G. Mackey, known for his dogmatic declarations, some of which were erroneous or disputative, e.g., his 25 «ancient, universal and immutable landmarks,» accepted by some but quite generally denied by others. The preferred authorities recognize the three symbolic degrees of the «blue lodge» in the United States as English or York Masonry and, hence, regular and legitimate Craft Masonry. The same is probably true of the Royal Arch Degree for it was so declared by the United Grand Lodge of England in 1813. The other degrees and orders of the Chapter, Council and Commandery may not be strictly so, but, by long usage, the term York has become fixed upon them. The name York Masonry became attached to English Freemasonry by reason of the legendary assembly, held there under the auspices of King Athelstan, and in the same way and quite as properly as the legend of King Solomon's Temple became a part of Masonic symbolism. The term is not to be confused with «Ancient York Rite» often used to imply that the working was there practiced prior to the Grand Lodge era, for it is not known with certainty what ceremonies were employed in any English lodge in the ancient period. Unlike the craft lodges, Capitular, Cryptic, and Chivalric Masonry are organized on a national basis. The General Grand Chapter of Royal Arch Masons of the United States was instituted by a meeting of delegates at Hartford, Conn., 24 Jan. 1798, and now has 49 Grand Chapters with some 3,500 chapters and approximately 500,000 members. In the rest of the world, there are about 3,000 chapters and 160,000 members. The General Grand Council of Royal and Select Masters has, in the United States under its Grand Councils, over 1,300 councils and 160,000 members. The Grand Encampment Knights Templar of the United States was organized at New York in 1816 and has some 1,600 commanderies and over 200,000 members.

The Scottish Rite, the other large branch of the supplementary Masonic system, is not, so far as known, Scottish, either in origin or character, but French as to both. Following the introduction of British Craft Masonry into France about 1725–26, the imaginative Latin temperament saw the possibility of elaborating upon the English rituals with the result that, by 1740, «Hauts Grades» or systems of higher degrees had begun to multiply, continuing to increase for a period of some 35 years. No complete list of them has ever been compiled but their number from first to last is said to have exceeded 200. Frederick the Great is asserted, with some disputation, to have been an active

Freemason and, if so, his connection was probably with the Hauts Grades, the 21st degree of which is called Naochite or Prussian Knight. The progress of the system was marked by numerous dissensions and disturbances largely the outgrowth of rivalry amongst the advocates of several groupings or systems and the contention of the votaries of the rite that they were possessed of advanced secret knowledge and, thus, superior to Masons of the symbolic degrees. The rite eventually came to dominate the Grand Lodge of France until the revolution of 1789 virtually eliminated Freemasonry in that nation. The French Scottish Rite never revived but was reformed and reorganized in America where it was carried by Stephen Morin under a patent of 27 Aug. 1761, giving him power to form lodges in the New World. Under various deputations from Morin, Lodges of Prefection were established at Albany, N. Y., in 1767; Philadelphia, Pa., in 1781; and Charleston, S. C., in 1783, followed by a Council Princes of Jerusalem at Charleston in 1788 and a Council Princes of the Royal Secret at the same place in 1797. On 31 May 1801, John Mitchell and Frederick Dalcho organized a Supreme Council 33d Degree at Charleston, which came to be recognized as the head of the Scottish Rite in the world. Through its deputy, François Auguste de Grasse Tilley, a Supreme Council 33d Degree was organized at Paris, France, in 1804, and almost at once became embroiled with the Grand Orient of France. The American bodies developed internal discord due largely to the uncontrolled creation of inspectorships and deputations and the private communications of degrees. Nonconforming groups sprang up, among which was the «Rite of Cerneau,» later merged into the Scottish Rite, Northern Jurisdiction, though offshoots of it possibly yet remain. The Charleston body, in 1813, authorized the Northern Supreme Council at New York, which subsequently removed to and is now located at Boston. The Southern Council moved to Washington, D.C., where it is now seated in the House of the Temple. Its title is «The Supreme Council (Mother Council of the World of the Inspectors General, Knights Commander of the House of the Temple of Solomon) of the Thirty-third and Last Degree of the Ancient and Accepted Scottish Rite of Freemasonry for the Southern Jurisdiction of the United States of America (whose See is at Charleston, in the State of South Carolina).» It is governed by a Grand Commander and not to exceed 33 deputies. There are in the United States belonging to the Supreme councils of the Northern and Southern jurisdictions some 204 consistories of the Scottish Rite with approximately 425,000 members. Supreme councils exist in England, Scotland, Ireland, Egypt, Canada, Mexico and in 13 Central and South American countries. In Europe and Turkey, some 15 Supreme councils were suppressed during the Second World War.

In addition to the foregoing, several other orders have from time to time arisen, not Masonic, but confining their membership to Freemasons or their relatives. Among the more prominent are or have been: the «Order of the Secret Monitor» which developed out of the «Brotherhood of David and Jonathan,» the «Royal Order of Scotland,» the «Tall Cedars of Lebanon» or the «Grotto,» the «Palm and Shell,» the «Sciots» and, lastly and best known, the «Ancient Arabic Order Nobles of the Mystic Shrine,» a social order often called the «playground of Masonry.» Organizations confining their membership to Freemasons and their female relatives are: the «Order of the Eastern Star,» the «Order of the Amaranth,» the «White Shrine,» and «Daughters of the Nile.» The «Order of DeMolay» is for boys and «Job's Daughters» for girls of Masonic parentage.

Organization and Doctrine.—Although the three and, for a time, the four Grand Lodges of the British Isles chartered lodges all over the world, frequently in competition, the spirit of concord with which Freemasonry has, on the whole, been blessed, long since resulted in Masonic comity by which each Grand Lodge came to recognize and respect the jurisdiction of the others. Each is, therefore, independent and sovereign in its accepted zone of influence usually, but not always, conforming to the boundaries of a state, province, nation, or other political subdivision. By reason of the intercolonial independence or even jealousy of the American colonies during the period which witnessed the introduction of lodges in America, a system of colonial and state organization, rather than national, evolved. This distribution of authority has, on the one hand, promoted harmony and, on the other hand, prevented the erection of any central power competent to represent the whole fraternity or any major portion of it, either as to administration, ceremonial or doctrine. Freemasonry is, therefore, viewed as a whole, less an organization than it is a system of philosophy and morality administered by many organizations. The York and Scottish Rites, in some measure, reflect the political institutions under which they grew up. The former, emerging from democratic surroundings, particularly those flowing from the English revolution of 1688, is administered by Grand Lodges which consist of certain officers, usually Masters and Wardens and often Past Masters of the subordinate lodges. Its tenets are based on the moral principles of brotherly love, relief, truth, temperance, fortitude, prudence, justice and fidelity. The Scottish Rite, on the other hand, arose within a monarchy and was the product of minds imbued with the themes of the approaching French Revolution of 1789: liberty, equality, and fraternity. Its administration is vested in self-perpetuating Supreme Councils of the 33d Degree which control the subordinate bodies, and its doctrine and literature, while not political, are, nevertheless, not oblivious to matters of church and state. Though founded upon Craft Masonry, the Scottish Rite is not so much a branch thereof as it is a separate system of Masonry; entirely so as to organization, and largely so as to doctrine. It is the predominant Masonic system in many foreign lands, particularly the Latin and Latin American countries, though it is also popular in the United States. While Craft or York Masonry is practiced in almost all countries, its greatest influence is amongst English-speaking peoples. The English rites are simple and teach elementary truths in terse phrases, the candidates participating in the working of the degrees, whereas in the Continental rite, the presentation consists of a more numerous series of elaborate degrees embracing lessons in morality, spirituality, philosophy, allegory and classical lore, many intricate in concept and all presented on stage with

rained casts and elaborate costuming and scenery, while the candidates and members in a large group observe from the floor. Probably no other system in the world portrays, to its votaries, its teachings with such pageantry and drama. The craft lodges are relatively numerous, localized and individualistic, there being few communities of 5,000 population, and often less, in England or in the United States without a "blue lodge," whereas the Scottish rite bodies are fewer and confined to the larger centers of population, their members residing in a large area. *Morals and Dogma of the Ancient and Accepted Scottish Rites* (1881), the work of Albert Pike, lawyer, scholar, linguist, philosopher and moralist, which is the textbook of the Scottish rite, is worthy of anyone's perusal and is unmatched by any production of other branches of the order.

Though widely disseminated and variously administered, and despite the absence of any central ruling body, Freemasonry faithfully retains its fundamental principles, teachings, legends, customs, and laws. This it does as a matter of pride in, and as a token of its descent from, the fraternity of cathedral builders of 500 and more years ago, and in conformity with an old precept that condemns innovations in the body of Masonry and prohibits deviations from the ancient landmarks of the craft. Notwithstanding the absence of any authority capacitated to define such landmarks, and even with an abundant diversity of opinion in enumerating them, their general nature and spirit are felt and observed.

It is to be remarked that, in what is commonly said to be a rapidly changing world, Freemasonry, though adhering to its old, liberal, and for the most part simple creed, should not only maintain but increase its popular appeal. Though it disavows any political ideas or preferences, its fundamental tenets of freedom of conscience and benevolence and charity toward all mankind necessarily identify it with the ideals of human liberty and constitutional government.

Charities.—None of the Masonic bodies have any insurance features or offer any fixed benefits; nor will the fraternity tolerate the use of its name or symbols in connection with any insurance or business enterprise. Nevertheless, in keeping with ancient principles of mutual aid and assistance springing even from the ancient Gothic constitutions, the lodges and grand lodges as well as most of the supplemental orders make large charitable contributions mostly for the aid and support of incapacitated Masons, their widows and orphans, and service boards are maintained in most large cities to care for distressed or unemployed members regardless of the lodge to which they may belong. The contributions to Masonic charities in England, though voluntary, are surprisingly large, and there, as well as in most of the American jurisdictions, Masonic homes and orphanages are maintained.

Bibliography.—The bibliography for Masonry is abundant but must be read, particularly older works, with discrimination. The following are dependable:

MASONRY AND BUILDING.

The term masonry, from the French *maçonnerie*, is the art or work of building in stone. It originated in antiquity. Practically all the famous temples, the Pyramids and monumental structures of medieval times, extending down through the Rennaissance, were erected in stone. In the earliest period massive foundations and walls of granite blocks, amazingly cut and proportioned, were set without mortar which was then unknown. This is called dry masonry. Since the advancement of organized production, particularly in the present century, masonry has been subjected to striking changes. The utilization of modern machinery and up-to-date appliances points to progress commensurate to a degree with competitive industries. The more important stone works, facing higher labor and materials costs, and with emphasis placed upon speed and modern techniques, have found it necessary to subordinate or largely eliminate hand labor. The substitution to a considerable extent of steel and other materials for building stone is significant of economic and industrial pressures. Advances since the introduction of steel skeleton construction in the last quarter of the 19th century have resulted in the use of machinery to maintain masonry operations profitably. In the design of large commercial structures in the United States and Canada, high costs and requirements of industrial techniques make the matter of location, purpose of the building, and the adequacy of suitable materials a primary consideration.

Durability of building stone is essential. Classified as masonry materials are natural stones, brick, tile and terra cotta. Also used in masonry work are (1) reinforced concrete, a conglomerate of portland cement, crushed stone, water and sand, with steel rods or bars embedded

in the concrete to supply additional strength for resisting tensile stresses; (2) concrete blocks, made of portland cement, water and crushed stone or cinders, which are durable and fire resistant; these units minimize waste in construction. Artificial stone, cast in molds, is more economical than natural stone. When rubbed to a finish this product harmonizes with other structural effects by reason of a variety of colors. The ubiquity and abundance of materials for constructing masonry units, in contrast to the limited sources of supply of other building materials, assure that masonry will continue as an important form of construction for many centuries. (See also CEMENT.)

Building stones are grouped as (1) igneous rocks, including granite—hard, durable and strong, and for centuries basically a masonry unit; also traprock, an ingredient of concrete; (2) sedimentary rocks—limestone and sandstone "in various hues," and (3) metamorphic rocks; in this group are vari-colored marble and also slate. Marble takes a high polish. In the United States, building stone deposits are widely distributed (see also QUARRYING; BUILDING MATERIALS, EQUIPMENT AND TECHNIQUES). Great Britain has a wide variety of native stones, and in the Western Hemisphere, Canadian limestone (the Tyndall, the Trenton and other varieties) has been utilized during the last fifty years in the construction of buildings and also canals. Good practice calls for special care in the selection and placing of building stone. All building stones are affected by weather conditions—frost, temperature changes, and wind-driven rains, especially in cities. Sulphuric acid in the atmosphere deteriorates the stone.

Mortar (q.v.), among many cementitious materials, is selected for its particular purpose—workability. An aggregate of natural cement, sand, water and lime is used in laying brick and setting stone. For setting solid masonry foundations a mortar of greater strength, with portland cement, lime putty, and sand as components, is used. Structural wall strength and durability are indispensable. As the stone is strong, so should the mortar be.

Masons and Tools.—Employed in masonry construction are masons, stone cutters, workers on limestone and sandstone, workers on rubble walls, layers of paving slabs, joiners, fixers who place the stone, machinists, and the masonry draftsmen, also excavators, foundation workers, bricklayers, terra cotta and fireproofing unit workers, plasterers, metal workers, roofers and laborers. On masonry piers and bridge abutments or heavy tunnel construction, the cooperation of other trades is sometimes required. As of 1950–51, masonry construction of bombproof and gasproof underground shelters in cities and towns in the United States was evident for emergency use, in addition to existent shelter facilities provided by subways and steel frame office and apartment buildings.

Masons' tools (see illustration) in general include: the wooden mallet, steel hammers used severally by hard-stone masons, marble masons and granite masons; and the iron hammer used as a carver's tool. The pitching tool reduces the size of rough stones. Soft-stone masons use the dummy. The punch cuts surplus hard stones. The mallet-headed point furrows the stone. Chisels include the hammer-headed for granite, mallet-headed for drafting, the boaster for draft work, and the claw tool; also the patent cla with teeth for hard stone. Mallet-headed goug are used for hollow moldings; the batting to "surfaces" sandstone, the water-chisel cuts sc limestone, and the Lewising tool cuts mortise The driver is used for soft stone, and the quirki tool cuts grooves. The steel diamond jumper used for boring holes, and the mitre tool clea up molding intersections. (See also STONE-CU TING AND DRESSING.)

Machines.—The frame saw, in a swingi frame, saws stone into slabs. Cutting to si and shape is done by diamond-circular ste saw blades. Carborundum saws "joint off" ma ble and slate. The jointer saw is used for cu ting small dimensioned stones. Planing ar molding machines (two types) operate on co nices and plane surfaces; turning lathes sha columns and balusters. Hoisting appliances i clude nippers with hooked arms, and Lewis bol which are fitted into dovetailed mortises in t stone to be raised.

Stone Construction.—Strength of the fou dation walls is essential. Foundations now ge erally are composed of portland cement concret They should be evenly proportioned in order prevent any unequal settling of the buildin The footings are projecting courses at the wa base; they are sufficiently spread to distribu the load over as large as area as practicable. the supporting capacity of the ground selected not adequate, concrete piles and reinforced raf may be used; otherwise the area of the footing is extended. In Chicago, owing to the soft so grillage work is necessary in the construction many of the larger buildings. Granite is use when architectural appearance is essentia Limestone and sandstone are laminated and sp cial care is required in placing these stones the wall bed at right angles to the direction the thrust.

In masonry construction, stonework compris mainly ashlar, rubble, and trimming. Ashlar co sists of carefully worked and jointed stone block which form the outside facing of the wall. generally is stoneyard cut. The face of the sto may be plain, vertically tooled, truly worke reticulated, or rusticated, finished in any of se eral ways. All joints are dressed to plane The blocks vary from twelve to eighteen inch in depth, and from four to eight inches in thick ness. When of uniform size and laid in co tinuous courses (a course is a continuous lev range of masonry throughout the face of a build ing), the work is known as regular course as lar. The face of the stone may be plain or hav molded joints. When the blocks are laid in a ternate wide and narrow courses the wall facin is called alternate course ashlar. In course not continuous, and with stones of various size the wall face is called broken ashlar or rando ashlar. Rubble generally consists of irregula stones having one good face fit for an expose wall surface. These stones are seldom cut. The are taken usually as they come from the quarr When laid up in walls the interstices should b filled with pieces of broken stone and morta Coursed rubble stones are roughly quarry-square and leveled up in twelve to eighteen inch course

Trimming in masonry work includes: co nices, sills, quoins, door and window facing moldings, jambs, and copings. Ashlar facing ma be backed with brick, rough stone, hollow ter cotta, or concrete blocks. The *cornice* is th

projecting molded top course of the wall; the *gable* is the vertical wall at the end of a pitched roof. The *bed* is the lower surface upon which the stone rests; the *sill* is a broad stone at the base of a door or window; a *quoin* is a wedgelike stone at the intersection of two walls. The *coping* is the covering top course of a wall; a *molding* is a plane or curved decorative surface; a *jamb* is an upright stone at the side of an opening. The *plinth* is the lowest course of stonework projecting from the base of the main wall face. *Bond stones* in walls tie in masonry units as a whole, giving effective jointing and greater solidity. *Joints* are prepared surfaces for fitting into other stones butting against them. A *closer* is the last stone to be placed in a course. A *throat* is a groove cut under the coping or cornice to prevent rain from running down the face of the wall.

Arches generally span wall or bridge openings. In masonry they consist of wedge-shaped stones or other solid materials called voussoirs; and are usually curved. In placing such stones the layers should rest at right angles to the face of the arch. Joints between the stones radiate from the center. The weight the arch carries is, accordingly, distributed from stone to stone.

Brick Construction.—Building brick, classified as masonry units, include common brick of the kiln run; face brick, more uniform in size and shape than common brick; and glazed brick with decorative effects which are made by a special process. Common brick generally is employed to back up the masonry facing material; face brick is placed in exposed walls. Building brick, standardized in size, generally runs 2¼ x 3¾ x 8 inches. The brick is made from selected ground clay, mixed with water, molded and kiln-fired at from 1600 to 2000 degrees Fahrenheit. See also BRICKS; CLAY-WORKING AND BRICK-WORKING MACHINERY.) In brick wall construction it is customary to tie in the bricks with metal ramps, in order to provide a unified masonry mass and thus distribute the load over the whole area. This is a form of *bonding*.

Common bond, English bond, and Flemish bond are most frequently used. Common bond consists of five stretcher courses with headers (bricks laid with their ends toward the face of the wall) and stretchers (bricks laid with their length parallel to the face of the wall) in each course. The English and Flemish bonds are more expensive to lay than the common bond. The Flemish bond is frequently used to provide an attractive wall surface. There is also an English cross-bond with alternate courses of stretchers arranged with the joints below the middle of the bricks above. Skeleton steel frame construction provides support for the outer masonry walls at each story by the use of spandrel girders. These are called "curtain" walls. Tying brick-bearing walls to the floor beams at horizontal intervals of 6 feet at each tier is a modern practice. The walls forming an angle should be carefully bonded. In brick walls, stone quoins or other solid wedgelike supports frequently are set into exterior angles like a voussoir in an arch. Window and door openings may be spanned by stone or brick horizontal lintels; the lintel supports the superstructure. It consists of one or more masonry units keyed to adjust the weight. Building brick is cheaper than stone. Engineering brick, made for heavy duty construction, and other designs meet special requirements in building.

Structural load-bearing clay tile, kiln burned, is designed to resist impact and moisture in building walls; also to support heavy and compressive loads. Non-load-bearing tile, molded and kiln treated, are made in many shapes and sizes for floor construction, fireproof interior partitions, and wall coping. Mixtures of clay and shale are employed in the manufacture of structural tile. Facing tile is made from a mixture of fire clay and water. Hollow interior spaces in the various units are designed to meet building requirements.

Historical.—Masonry's origin and development are traced through ruins of Babylonian temples, the Egyptian pyramids and tombs, and down through centuries of the Mycenaean, Greek, and Roman civilizations. Contrasted with massive masonry structures erected in Egypt, the Assyrians built temples and palaces from platforms reached by steps. Assyrian walls were of sun-dried brick, faced with kiln burned brick. "Cyclopean" and, later, Greek rectangular masonry necessitated the laying up of huge stone blocks in regular courses. The Greeks developed the Doric, Ionic, and Corinthian columns for use in monumental structures. The walls were chiefly of marble and stone blocks. The Romans adopted the columnar style of the Greeks; they also invented concrete and developed arch, vault, and concrete construction. Roman walls of rectangular stone blocks were laid up; concrete, faced and unfaced, was employed — the unfaced for foundations. Concrete vaults and cross-vaults, cast in solid mass, were extensively used. Marble and brick were employed for wall surfaces. The Romans frequently employed the circular and polygonal forms in the construction of temples and public buildings of enormous size. The key to such operations was in the arch, vault, and dome system. The arch made it possible to span wide openings. In modern times, reinforced concrete and steel-frame construction have put industrial pressure on masonry, making it imperative to use machinery in competitive operations. See also ARCHITECTURE.

ROYAL GURLEY,
Technical News Analyst; formerly News Editor, "Aero Digest," New York.

MASOOLA, mä-sōō'lä, a boat common on the coast of Madras, India, adapted to be beached on the surf-beaten shore. The planks are sewed together with coir, over wads of the same material, which press upon the seams. The boats are 30 to 35 feet long, 10 to 11 feet in beam, 7 to 8 feet deep, and are rowed by 12 men, oars double banked, and a steersman with an oar at the stern.

MASORA or **MASORAH**, mä-sō'rä (from *Masoreth*, a Hebrew word signifying "tradition"), the name of a collection of notes referring to the Hebrew text of the Old Testament, and written in Chaldee chiefly on the margin of Hebrew manuscript. This collection of notes

are various in their character, critical, grammatical and explanatory. Since in early Hebrew writing no vowel signs appeared, great confusion arose in time from the many modes of reading and supplying vowels to the consonants. The Masora set a fixed reading to each word and thus put an end to the multiplicity of readings. At what time the accumulation of these notes was commenced cannot be ascertained. According to some Jewish writers the notes are in some cases as old as the time of Moses; according to others they were begun in the time of Ezra. It is more likely that they are the result not of one period but of many centuries of compilation and emendation. A useful edition of the Masora is the translation of Dr. Ginsburg (3 vols., London 1880–87). See JUDAISM — *The Massorah.* Consult Cornely, 'Introductio in V. T. Libros Sacros' (Vol. I, Paris 1894); Ginsburg, C. T., 'Introduction to the Hebrew Bible' (London 1899); Driver, S. R., 'Notes on Hebrew Text of the Books of Samuel, with Introduction to Hebrew Palæography' (2d ed., Oxford 1913); Harris, 'Rise and Development of the Massorah' (in *Jewish Quarterly Review,* Vol. I, London 1889).

MASPERO, SIR Gaston Camille Charles, gäs-tôn kä-mēl shärl mäs-pĕ-rō, French Egyptologist: b. Paris, 23 June 1846; d. 30 June 1916. He studied in the Lycée Louis-le-Grand, 1853–65, and before entering the École Normale in 1865 had already made considerable progress in the study of Egyptology. He remained in the latter college two years and attracted the attention of Mariette, the distinguished Egyptologist. In 1867 he published in the *Revue Archéologique* an Egyptian text and translation under the title 'Stèle du Songe,' and in the same year appeared separately his 'Mémoire sur la grande Inscription d'Abydos et la Jeunesse de Sésostris.' On leaving the École Normale he went to South America to carry out researches in the Quichua language. Further memoirs on ancient Egypt extended his reputation and secured his appointment in 1869 as professor of the Egyptian language and archæology at the École des Hautes Etudes. In 1871 he issued an important essay, 'Des Formes de la conjugaison en Egyptien ancien, en démotique et en copte'; and in 1873 'De Carchemis Oppidi Situ et Historia antiquissima' and 'Du genre epistolaire chez les anciens Egyptiens.' In 1874 he succeeded Rougé as professor of Egyptian philology and archæology at the Collège de France. Sent to Egypt in 1880 as head of a government archæological mission, he succeeded Mariette in the following year in the directorship of excavations and antiquities. He founded and directed an archæological institute at Cairo, had charge of the museum at Bulak, now in Gizeh, carried out many excavations, with important results, and in 1886 returned to France to resume his duties at the college. In 1899 he again went to Egypt as director of excavations and antiquities. In 1914 he left Egypt and became permanent secretary of the Academy of Inscriptions and Belles-Lettres. Maspero's great work is his 'Histoire ancienne des Peuples de l'Orient' (1875), which has been republished in an enlarged and revised form (1894–99). The three volumes of the later edition have been translated into English under the titles 'The Dawn of Civilization' (1894), 'The Struggle of the Nations' (1896) and 'The Passing of the Empires' (1900). His other works comprise the following: 'Contes populaires de l'Egypte ancienne' (1883), translated by him; 'Etudes Egyptiennes' (1886-91); 'Archéologie Egyptienne' (1887; Eng. trans. 'Egyptian Archæology,' 1888); 'Lectures historiques' (1890; Eng. trans., 'Life in Ancient Egypt and Assyria,' 1892); 'Etudes de Mythologie et d'Archéologie Egyptiennes' (1893), invaluable to the student of the religion of ancient Egypt; besides contributions to the 'Mémoires' of the French Archæological Mission at Cairo; 'Les momies royales de Dëir-el-Bahari' (1889); 'Causeries d'Egypte' (1907; Eng. trans., as 'New Light on Ancient Egypt,' 1909); 'Egypt, Ancient Sites and Modern Scenes' (1911); 'Art in Egypt' (1912), and text and translations of the inscriptions upon the pyramids of the fifth and sixth dynasties in *Recueil de travaux relatifs à la philologie et à l'archéologie égyptiennes et assyriennes* (Vols. I–XIV), etc. In 1879 Maspero was made a knight of the Legion of Honor, and in 1895 commander. In 1883 he became a member of the Académie des Inscriptions, and in 1887 an honorary Fellow of Queen's College, Oxford, and an honorary D.C.L. of that university. In 1909 he was made knight commander of Saints Michael and George. See EGYPTOLOGY.

MASQUERADE, măs-kĕ-rād', a popular amusement, in which persons of both sexes mask or disguise themselves and engage in dancing or festivities. Masquerades date from a very early period in which they were connected with religious ceremonials and observances. We find traces of the masque in the Bacchanalia of Greece, the Saturnalia of Rome and in the Purim of the Hebrews. In the Middle Ages they were at times held in the churches, for instance the ceremony of the boy bishop, the feast of fools, etc. The clergy succeeded in putting a stop to these relics of paganism in connection with Christian worship in the 16th century. Masquerades of the modern purely secular type are said to have been the invention of Granacci, an Italian, who lived in the beginning of the 16th century. See CARNIVAL; FESTIVAL.

MASQUERAY, Emmanuel Louis, American architect: b. Dieppe, France, 10 Sept. 1861; d. Saint Paul, Minn., 26 May 1917. He was educated at Rouen and Paris. Having decided to become an architect he studied in the École des Beaux Arts, Paris, and in 1887 was awarded the Deschaumes prize by the Institute of France. He also received the Chaudesaigues prize in 1883. While in Paris he was also an attaché of the Commission des Monuments Historiques. Mr. Masqueray came to New York in 1887, and was at first connected with the office of Carrere and Hastings and later in the office of William M. Hunt. He opened an office here in 1893 and founded the Atelier Masqueray for the study of architecture according to French methods. This was the first wholly independent atelier opened in the country. His reputation became international in 1901 when the commissioner of architecture of the Saint Louis Exposition selected him to be chief of design or consulting architect. The monumental undertaking included the Tran-

portation Palace, the Agricultural, Horticultural, Fisheries and Forestry buildings, the Cascades, the Colonnade of States, pavilions, the Louisiana Purchase monument, 12 bridges, music stands and all the decorative architecture in the grounds. Mr. Masqueray was the architect of the famous cathedral of Saint Paul in Saint Paul, Minn., and the pro-cathedral of the Immaculate Conception in Minneapolis, Minn. He was a charter member of the Society of Beaux Arts Architects and the Architectural League of New York, the New York Chapter of the American Institute of Architects, as well as the national organization.

MASQUES. The old masques, fashionable in England in the 17th century, were in reality the kind of private theatricals that then generally prevailed at the courts of Europe. Their name is understood to have originated from the use of the head masque, representing either romantic, historical or allegorical types on occasions of festivity or solemnity. The first of these masques (or ballets, as they were called in Italy and France) that we find recorded was that given by Bergonzio di Botta, at Tortona, to celebrate the marriage of the Duke of Milan in 1489. It was the talk of all the élite of the Western World. Originally a parade or festival, a form of dramatic masque quickly developed in England under the wits of men as deft as Ben Jonson and Fletcher, aided and abetted by the master-designer, Inigo Jones (q.v.), reaching a height of tawdry theatrical beauty that died out almost as quickly as it had flamed. At Versailles and other courts the masque or ballet survived for over a century longer. The masque of to-day is philosophical in character. It is the drama of personified ideas. It is akin to allegory. Its dramatic purpose is the presentation of universal truths; and in this indirect way to bring their lessons home to the mind and heart alike. The pageant and masque are distinctly antithetical in character. The one is essentially concrete, the other is essentially abstract. The one depends on realism to tell its story, the other depends on symbolism, though either may make use of the elements of the other in subordination. Mr. Percy Mackaye's 'Masque of St. Louis,' performed in that city in 1914, was perhaps the soundest achievement of the American poet in this new form which has yet to find its authentic masters. During the Shakespearean tercentenary celebrations of 1916 many commemorative masques were written and performed. For these and sundry lists of "Masques and Festivals" lately held in the United States consult the bulletins of the American Pageant Association. See FESTIVAL; PAGEANT. The standard authorities on the English masques are Evans, H. A., 'English Masques' (London 1898); Reyher, Paul, 'Les Masques Anglais: étude sur les ballets et, la vie de cour en Angleterre, 1512–1640' (Paris 1909); Brotenak, Rudolf, 'Die Englischen Maskenspiele' (Vienna 1902).

MASS, *in physics,* the quantity of matter in a body. The mass of a body is the same wherever the body may be in the universe. Two bodies have equal masses if the gravitating forces with which another body acts upon them are exactly equal at equal distances. (See GRAVITATION). Hence two bodies have equal masses if their weights are the same at the same place on the earth; so that if the metallic "weight" used by a grocer is carried from place to place, the quantities of sugar and tea balanced by it in a good pair of scales will always be the same, for the mass of tea or sugar is in every case equal to the mass of the metalic "weight." It is to be clearly understood that as the force of gravity is different at different places on the earth, the weight of any body is different at different places. To distinguish between the mass (or quantity of matter) and the weight (or force which tends to move it downward) of a body is very important in beginning the study of physics.

MASS, The. According to the teaching of the Catholic Church, the Eucharist is the Sacrament which contains the body and blood, soul and divinity, of Jesus Christ under the appearances of bread and wine. At the Last Supper (see LORD'S SUPPER), the night before He died, Christ, in the presence of the 12 apostles, instituted the Eucharist (q.v.) by taking bread, giving thanks, blessing the bread, breaking it, and giving it to the apostles, saying, "Take ye and eat. This is my body," and then by taking the cup of wine, giving thanks, blessing the wine, and giving it to them, saying, "Drink ye all of this. This is my blood which shall be shed for the remission of sins. Do this for a commemoration of me." The Church teaches that, when Christ said "This is my body," the substance of the bread was, by His almighty power, changed into the substance of His body, and that, when He said "This is my blood," the substance of the wine was similarly changed into the substance of His blood, while the appearances of bread and wine remained. The Church further teaches that the change of bread and wine into the body and blood of Christ, called Transubstantiation (q.v.), continues to be made by Jesus through the ministry of His priests, to whom through the apostles and their successors, He gave this miraculous power when He said, "Do this for a commemoration of me." The priests exercise this power of Transubstantiation through the words of consecration in the Mass. What, then, is the Mass? The Mass is the solemn memory, with a narrative, of Christ's passion and death. It is the perpetual sacrifice of the New Covenant. In the catechism it is described as the unbloody sacrifice of the body and blood of Christ. It is, specifically, a sacrifice of adoration, thanksgiving, propitiation, and impetration. As, in the offering of this sacrifice, certain words and actions in fixed form are used, the Mass may be defined as the aggregate of prayers and ceremonies which constitute the service of the Eucharist in the Latin, that is, the Roman and Gallican, rites.

This service was known at first by many names: *Εὐχαριστία,* gratiarum actio, thanksgiving; *Λειτουργία,* liturgy, rite; *προσφορά,* oblatio, offering; *κλάσις ἄρτου,* fractio panis, breaking of bread; *κυριακὸν δεῖπνον,* cœna Domini, the Lord's supper; *κοινωνία,* communio, communion; *σύναξις, συνέλευσις,* meeting; solemnia; dominica solemnia; dominica passio; spirituale ac cœleste sacramentum; Dominicum; passio; sacrificium. *Λειτουργία* still survives in the Eastern Church, and "holy liturgy" corresponds exactly to the word Mass. This latter

term has become the recognized and almost exclusive technical name for the liturgy of the West. Its derivation is even yet not quite certain; but it is generally said to be a late Latin verbal noun for *missio* (=*dimissio*), from the verb *mittere,* to send, send away. Primarily, *missa* was used in the sense of «dismissal» with reference to the concluding part of the service, and then, by a gradual process well known to linguists as well as to students of liturgy, it was extended to the whole rite. The first time we know for certain that it was employed in its present sense was in the 4th century, about 385 or 386, in a letter of Saint Ambrose to his sister, in which occurs the statement, *missam facere cœpi* (=I begin to say Mass). A 2d century instance of the use of the word *missa* in this sense is of doubtful authenticity. From the 4th century onward it becomes more and more frequent, until in the 'Sacramentarium Leonianum' (Leonine Sacramentary), of the 5th or 6th century, it is understood throughout (*Item alia=Item alia missa*), and in the 'Liber Sacramentorum Romanæ Ecclesiæ,' usually known as «The Gelasian Sacramentary,» of the 6th or 7th century, it is constantly expressed. Thereafter, while Eucharist remains the normal name for the sacrament, *Missa,* or one of its derivatives in other languages like Mass in English or Messe in French, has been the regular title given to the Eucharistic sacrifice in the Roman and Gallican rites.

So much for the word, which is clearly much later than what it denotes. The history of the Mass itself has its origin in the New Testament in the four accounts of the Last Supper found in Matthew xxvi, 26–28; Mark xiv, 22–24; Luke xxii, 19–20; and Paul, 1 Cor. xi, 23–26. What Christ then did is the foundation of the Mass. It is because He told the apostles to do, in memory of Him, what He himself on that occasion had done, that the liturgy of the Mass came into being and has continued through the ages. That liturgy, fluid and variable in detail, but uniform in outline and in many formulas, always the same in essentials, and from constant repetition tending ever to become fixed, is traceable with more or less certainty through the 1st century in different parts of the New Testament, in the 'Didache' or «Teaching of the Twelve Apostles» (c. 80–100), in the 'First Epistle of Saint Clement of Rome to the Corinthians' (c. 90–100), in the 'Epistle of Barnabas' (c. 96–98), and in the letters of Saint Ignatius, bishop of Antioch (d. 107). In the 2d century there is very probably an interesting allusion to the Mass from the outside, in a letter written by the pagan, Pliny the Younger (C. Plinius Cæcilius), governor of Bithynia, to the Emperor Trajan about 111–113. The eucharistic service, mentioned by Saint Polycarp, bishop of Smyrna (martyred c. 155), by Athenagoras of Athens (c. 177), and by Theophilus, bishop of Antioch (c. 180), is set out in considerable descriptive detail by Saint Justin Martyr (put to death, c. 165) in his 'First Apology' addressed to Antoninus Pius (138–161), and is also treated of by Saint Irenæus, bishop of Lyons (d. c. 202). In the 3d century we already see traces of those different practices in different countries which led to the different liturgies. For the rite followed in Alexandria and Egypt, we have as spokesmen Clement of Alexandria (d. c. 215), Origen (d. 251), and Dionysius of Alexandria (d. 264); for that of Antioch and Syria we have the fragmentary outline given in the second book of the 'Apostolic Constitutions' (which, however, was not written down until the 5th century as the *Διαταγαὶ τῶν ἁγίων ἀποστόλων*), as well as the complete text of a liturgy in the eighth book of the same work; for Rome and the West we have vague allusions in the writings of Hippolytus (d. 235) and Novatian (c. 250); and for the African Church or Church of Carthage we have Tertullian (d. c. 220) and Saint Cyprian, bishop of Carthage (d. 258). The liturgy given in the eighth book of the 'Apostolic Constitutions,' as well as being an early form of the rite of Antioch, is also possibly an example of an early type of the rite of the whole Church. When we reach the 4th century we have much fuller liturgical information, at least for the East, not only in the writings of Saint Athanasius (d. 373), Saint Basil (d. 379), Saint Cyril of Jerusalem (d. 386), and Saint John Chrysostom (d. 407), but also in the *εὐχολόγια,* or service books, which from about the end of this period began to be compiled for Church use. From this time too, we have the specifically different rites which were already foreshadowed in the 3d century. It is generally accepted that the fairly uniform type of liturgy previously used everywhere developed into four great parent-rites, from which all others now in use in Christendom are derived. These four are the liturgies of Antioch, Alexandria, Gaul, and Rome.

I. The rite of Antioch, found pure in the Greek 'Apostolic Constitutions,' was modified at Jerusalem into the Liturgy of Saint James, which itself took the place of the older liturgy at Antioch, and was used throughout the whole patriarchate, embracing all western Syria. This modified liturgy is found in (1) the Greek Saint James, now used only once a year at Zacynthus on 23 October, the feast of that saint, and at Jerusalem on 31 December; (2) the Saint James in Syriac, used by the Syrian Jacobites and Uniates; and (3) the Maronite rite, used in Syriac and also in Karshuni, that is, Arabic written in Syrian characters. The second rite derived from the primitive one of Antioch is the East-Syrian or Chaldean, which is found in two forms, (1) that used, in Syriac, by Nestorians and Chaldean Uniates, and (2) the Malabar rite, which is used, also in Syriac, by Malabar Uniates. The third derivative of Antioch is the Byzantine rite, used in Greek, Arabic, Old Slavonic, Rumanian, and many other languages, by all the Orthodox and by Melchites and other Byzantine Uniates. Next to the Roman Mass, this is the most widespread Christian liturgy. The fourth and last rite derived from Antioch is the Armenian, which is used, in classical Armenian, by Armenians, whether Gregorian (i.e., schismatical) or Uniate. II. The second eastern rite, the Alexandrian, gives us (1) the Greek Liturgy of Saint Mark, which is now no longer used; (2) the Saint Mark in Coptic, used by the Copts, both Monophysite and Uniate; and (3) the Ethiopic liturgy, used by the Monophysite Church of Abyssinia. The two great western parent liturgies are the Gallican and the Roman. III. The Gallican rite, in Latin, was used in

North Italy, Gaul, Germany, Spain, Britain, and Ireland. It was imported about the 4th century from the East, probably from Antioch. From about the 8th century it began to be gradually supplanted by the Roman rite, which became itself considerably Gallicanized in the process. By the 10th or 11th century the Gallican had entirely given way to the Roman rite, except in one or two places. It still survives under the title Ambrosian at Milan, in Italy, and under the title Mozarabic at Toledo, in Spain. In each case it is greatly Romanized, particularly so at Milan. IV. Finally, we have the liturgy of Rome. The original pure Roman rite is now no longer used, nor is the African rite, which belonged to the same family and had many features in common with the present Roman Mass, not the least being that its language was Latin even at a time when Greek was still employed at Rome and elsewhere. The present Roman rite, by far the most widespread of all, is used, in Latin, by nearly the whole Roman patriarchate. It occurs, however, in a Slav dialect in parts of Dalmatia and occasionally in Greek at Rome. In parts of southern Italy, Sicily, and Corsica, although they belong to the Roman patriarchate, the Byzantine rite is used. There are various mediæval modifications of the Roman rite peculiar to the religious orders of the Dominicans, Carthusians, and Carmelites. There were also modifications adopted in certain dioceses, and a few of them, Lyons for example, still keep these local forms; but in most cases the local usage has been abolished.

In the early period the liturgical language used at Rome was Greek, for Greek was spoken by the Roman Christians as well as by those of other centres of Christianity, such as Alexandria, Antioch, and Jerusalem. For example, Pope Clement I (c. 91–104) uses Greek in that famous 'First Epistle to the Corinthians,' to which reference has been already made, and the earliest inscriptions in the Roman catacombs are certainly in Greek. As far as is known, the first Christians to use Latin were those of Africa (Carthage). Pope Victor I (190–202), who was born in Africa, is often said to have been the first Roman pontiff to use it; but this has been disputed. The question turns on whether Victor or Saint Cyprian was the author of the treatise 'De Aleatoribus.' The 3d century popes, Cornelius (251–53) and Stephen (254–57), write in Latin. It may perhaps be fairly said that from about the 3d century Latin became the customary language spoken by Christians at Rome, and gradually from that time onward the only one. It is difficult to say when Latin replaced Greek for Church use. Some authorities place the change at as early a date as the second half of the 3d century; others are of opinion that Greek retained the liturgical language until the end of the 4th century. At all events, in Pseudo-Ambrose 'De Sacramentis' (c. 400) and in a letter of Pope Innocent I (401–17) to Decentius of Eugubium (c. 416) we find that the Mass was then said in Latin. It is probable that there was a transition period, during which the two languages were employed side by side. We know from the first Roman Ordo (c. 770) that as late as the 8th century lessons were read and psalms were sung in Greek. As a matter of fact, Greek has not, even now, entirely disappeared. We still have the Kyrie Eleison in every Mass and the Trisagion, Agios O Theos (O Holy God), Agios ischyros (O Holy Strong One), Agios athanatos, eleison imas (O Holy Immortal One, have mercy on us), in the Mass of the Presanctified on Good Friday.

The development of the Roman Mass into its present form is also difficult to trace, at least in some of its earlier stages. Clement I of Rome, Justin Martyr, Hippolytus, and Novatian are in substantial agreement as to the liturgies which they describe or mention; but our information as to the developments of the Roman rite during the latter half of the 3d and nearly the whole of the 4th century is extremely scanty. What we find is that between the 2d and the 5th century certain important changes were made. When we reach the 5th century we are on surer ground, for the 'De Sacramentis' and Innocent the First's letter to Decentius prove not only that the Mass was then said in Latin but also that it is in essence the rite still in use. In the 'Gelasian Sacramentary,' of the 6th or 7th century, showing the service considerably shortened, we have what is practically the present Roman Mass. Pope Saint Gregory I (590–604) made certain modifications, and left the Roman liturgy largely in the state in which it exists to-day. He it was, in particular, who gave the final touches to the Canon. "No pope," says Benedict XIV (1740–58), "has added to or changed the Canon since Saint Gregory." The Council of Trent (1545–63), wishing uniformity everywhere in the celebration of the Roman Mass, appointed a commission to examine and revise the Missal and restore it to its earlier form, "according to the custom and rite of the holy Fathers." This commission, named on 16 Feb. 1562, had not finished its labors at the close of the Council, 4 Dec. 1563, and its authority was continued and action on its report left to the Pope, Pius IV (1559–65). It was not, however, until the reign of his successor, Pius V (1566–72), that the revision was completed. On 14 July 1570 the reformed Missal — 'Missale Romanum ex decreto ss. Concilii Tridentini restitutum' — was published by the Bull, *Quo Primum,* commanding that that Missal alone should be used wherever the Roman rite is followed. That command put an end to most of the mediæval derived rites. There was, however, an exception. Any liturgy that could prove a prescriptive right by an existence of not less than two centuries was allowed. It is by virtue of this exception that the independent Gallican liturgies at Milan and Toledo, as well as the modified rites of certain religious orders and the local usages of some dioceses, were preserved. This Missal of Pius V is the one still in use. It has, however, since undergone various corrections in non-essentials. A second revised Missal was published by Clement VIII (1592–1605) by the Bull, *Cum Sanctissimum,* of 7 July 1604. Again on 2 Sept. 1634 Urban VIII (1623–44) by the Bull, *Si quid est,* published yet another revision. The last revision of the text, with a correction of the rubrics, was made by Leo XIII (1878–1903). His missal — 'Missale Romanum ex decreto ss. Concilii Tridentini restitutum, S. Pii V Pont. Max. iussu editum, Clementis VIII, Urbani VIII et Leonis XIII auctoritate recognitum' — was published in 1884. The

changes effected by Pius X (1903–14) have reference to the music.

Of the Mass, so instituted, developed, reformed, authorized, and promulgated, it remains to say a few words. It is, indeed, not within the scope of the present article to give in detail the many complicated rules and the minute rubrics that are to be observed in the celebration of Mass. These things, which must be mastered before ordination by every aspirant to the priesthood, are to be found fully set forth in books on ceremonial. All that can be given here is a general outline of the prayers and of some of the ceremonies used. The norm is Missa Solemnis, or High Mass, sung by celebrant, deacon, subdeacon, and choir. The following sketch therefore refers to High Mass and, further, to High Mass as celebrated on an ordinary Sunday. The procession, consisting of thurifer, acolytes, master of ceremonies, subdeacon, deacon, and celebrant, all appropriately vested in accordance with the rubrics, having reached the foot of the altar, the celebrant makes the sign of the cross, and he and his assistants say certain preparatory prayers, including the 42d [43d in Rev. vers.] Psalm and the Confiteor or General Confession. Going up to the altar, the celebrant says silently two short prayers asking forgiveness of his sins. Then, having blessed the incense and incensed the altar, he reads the Introit, consisting of an antiphon, a verse of a psalm, and the little doxology, Gloria Patri, etc. The Introit has previously been sung by the choir. The Kyrie Eleison follows, said by the celebrant and the assistant ministers, and sung by the choir. The celebrant then intones the first words of the great doxology, Gloria in Excelsis Deo, and he and the ministers say the remainder of it together, while the choir sings it. Turning to the congregation, the celebrant greets them, in his singing voice, with the salutation, Dominus vobiscum (The Lord be with you), to which the choir answers, Et cum spiritu tuo (And with thy spirit). He then sings the word, Oremus (Let us pray), and, turning his face to the altar, he sings the prayers known as the Collects, which are different every day. These are followed by the Epistle, which the celebrant reads while the subdeacon chants it. After the Epistle comes the Gradual, consisting of two separate chants, of which the first is the Gradual proper and the second is the Alleluia or, in Lent and on certain fast days, the Tract. Five times in the year, as well as in all Requiem Masses, the Gradual chants are followed by a canticle known as the Sequence. The celebrant then says silently the prayers, Munda cor meum, etc. (Cleanse my heart, etc.), and Dominus sit, etc. (May the Lord be in my heart and on my lips, etc.), reads a selection from one of the four Gospels, and blesses the incense. The subdeacon then holds the Gospel-book and the deacon incenses it, and then sings the Gospel as previously read by the celebrant. At the end the response, Laus tibi, Christe (Praise to thee, Christ), is said. At this point, a sermon, if there is one, is preached, in the vernacular of course. After the sermon, the celebrant intones the first words of the Nicene Creed, Credo in unum Deum (I believe in one God), and says the remainder, which is sung by the choir. When the singing of the Creed is finished, the celebrant sings Dominus vobiscum and, after the response as before, he sings the word Oremus (Let us pray). Then follow in order the three principal parts of the Mass, namely, the Offertory, the Consecration, and the Communion. The Offertory is the beginning of the action of sacrifice. While the choir sings the Offertory antiphon, the celebrant offers the bread, wheaten and unleavened, with the prayer, Suscipe, sancte pater, etc. (Accept, holy father, etc.). Then, blessing the water and mixing a little of the water with the wine in the chalice, he says the prayer, Deus qui humanæ, etc. (God, who didst wonderfully create, and still more wonderfully renew, the dignity of man's nature, etc.). Next, offering the chalice, he and the deacon say, Offerimus tibi, Domine, calicem salutaris, etc. (We offer unto thee, Lord, the chalice of salvation, etc.). Bowing before the altar, the celebrant says the prayer, In spiritu humilitatis, etc. (In the spirit of humility, etc.), and then blesses the bread and wine with the prayer, Veni sanctificator, etc. (Come, Sanctifier, etc.). He then blesses the incense and incenses first the bread and wine with the prayer, Incensum istud, etc. (May this incense, etc.), and then the altar with the prayer, Dirigatur, Domine, oratio mea, etc. (Let my prayer, Lord, be directed, etc.). Handing back the censer to the deacon, he says, Accendat in nobis Dominus, etc. (May the Lord enkindle in us, etc.). Here the celebrant, the ministers, the clergy present, and the congregation are all incensed. Washing his fingers at the side of the altar, the celebrant recites the Lavabo, that is, the last seven verses of Psalm 25 [26], concluding with the little doxology. Then, bowing before the middle of the altar, he says the prayer, Suscipe Sancta Trinitas, hanc oblationem, etc. (Receive, holy Trinity, this oblation, etc.). He then turns to the congregation and gives the exhortation, Orate, fratres, etc. (Pray, brethren, etc.), to which the ministers make answer Suscipiat Dominus sacrificium, etc. (May the Lord receive the sacrifice, etc.). Next follow the Secreta, or secret prayers, which, like the Collects, vary every day, but are said, not sung, by the celebrant. The last Secret, which ends the Offertory act, he brings to a close with the Ecphonesis, Per omnia sæcula sæculorum, sung aloud, to which the choir responds, Amen. There follow three short chants sung dialogue-wise by the celebrant and the choir. The celebrant then sings the Preface, which ends with the Sanctus, etc., said by him and sung by the choir. At the Sanctus a bell is rung thrice. The Canon, which is the fundamental part of the Mass, follows. Its form never varies except for slight changes (1) when the Roman See is vacant, (2) when the Episcopal See is vacant, (3) when the Mass is celebrated (a) in Rome and (b) in some French churches, (4) when it is celebrated by (a) a Pope or (b) a bishop, (5) when a bishop is being consecrated, (6) on Maundy Thursday, and (7) at the time of the five chief feasts of the year, namely, Christmas, Epiphany, Easter, Ascension, and Pentecost. The Canon is said in a low tone (secreto) by the celebrant. He beseeches God to accept and bless the sacrifice, and to guard and protect the Church, the Pope, and the bishop; he prays for the living, present and absent; he commemorates the saints; he again

begs the acceptance of the sacrifice; he asks for peace and for deliverance from eternal damnation; he once more implores God to bless, approve, and ratify the oblation, so that it may become the body and blood of Jesus Christ. Then, reciting what Christ did with the bread the day before He suffered, he consecrates the Host by saying, secretly, plainly, and attentively, the words, Hoc est enim corpus meum (For this is my body). Immediately he genuflects on one knee and adores and elevates the Host, to show it to the people. Next, reciting what Christ did with the cup of wine, he consecrates the wine by saying the words, Hic est enim calix sanguinis mei, novi et æterni testamenti: mysterium fidei: qui pro vobis et pro multis effundetur in remissionem peccatorum (For this is the chalice of my Blood, of the new and eternal testament: the mystery of faith: which shall be shed for you and for many, for the remission of sins). Adding the words, Hæc quotiescumque feceritis, in mei memoriam facietis (As often as ye do these things, ye shall do them in remembrance of me), he again genuflects on one knee and adores the precious Blood and elevates the chalice containing it. During each elevation, a bell is rung thrice, additional lighted candles are borne by the acolytes, and the thurifer incenses thrice the consecrated bread and thrice the consecrated wine. Proceeding with the Canon, the celebrant says the Anamnesis prayer, in which a solemn commemoration is made of Christ's passion, resurrection, and ascension, and offers to the Lord the victim now on the altar, asking the Almighty Father to accept the offerings, and to command them to be carried by the hands of the holy angel to the altar on high, so that those who receive the most sacred Body and Blood of His Son may be filled with all heavenly blessing and grace. He next prays for the dead, prays again for the living, and makes a further commemoration of the saints, closing with the second Ecphonesis, Per omnia sæcula sæculorum. The answer, Amen, sung by the choir, brings the Canon to an end. Here follows that part of the Mass known as the Communion. The celebrant sings a short exhortation and clause, and then sings the Pater Noster as far as the word, tentationem. The choir sings the last petition, Sed libera nos a malo (But deliver us from evil). After this comes an Embolism, containing a further prayer for deliverance from evil and for peace, said by the celebrant, and ended by the third Ecphonesis, the words of which are the same as those of the two former ones. During the first part of the Embolism, he breaks the Host in the middle, over the chalice. Following the Ecphonesis and its response, he sings the greeting, Pax Domini sit semper vobiscum (May the peace of the Lord be always with you), to which the choir replies, Et cum spiritu tuo. Putting a particle of the Host into the chalice, with the prayer, Hæc commixtio et consecratio, etc. (May this mingling and consecration, etc.), he genuflects, bows down, strikes his breast thrice, and says the Agnus Dei, etc. (Lamb of God, etc.), which contains two petitions for mercy and one for peace. The choir sings the Agnus Dei. The celebrant, having made a further prayer for the peace and unity of the Church, gives the kiss of peace to the deacon, who in turn gives it to the subdeacon, and he in turn to the clergy present. The celebrant then prays for deliverance from his iniquities and from all evils, and asks that the participation of Christ's body may not turn to his judgment and condemnation, but may profit him to the safety and health of soul and body. Having said the words, Panem cœlestem accipiam, et nomen Domini invocabo (I will take the Bread of heaven, and will call upon the name of the Lord), he recites three times the Domine, non sum dignus, etc. (Lord, I am not worthy, etc.), a bell being rung each time, and, with specified and appropriate short prayers, he eats the consecrated bread and drinks the consecrated wine. During the two ablutions, that is, of the chalice and of his fingers, which follow, he says two other short prayers. While the choir sings the antiphon known as the Communion, the celebrant reads it, and this ends the Communion act. The last division of the Mass now begins. The celebrant, having sung the Post-Communion prayers, sings also the Dominus vobiscum, to which the choir gives the customary response. Then the deacon sings, Ite, missa est (Go, the Mass is ended), or, in penitential seasons, Benedicamus Domino (Let us bless the Lord), and the choir answers, Deo gratias (Thanks be to God). The celebrant says a final prayer, Placeat tibi, Sancta Trinitas, obsequium servitutis meæ, etc. (Holy Trinity, may the performance of my homage be pleasing to thee, etc.), and blesses the congregation. He then reads the last Gospel, which is normally the beginning of the first chapter of the Gospel of Saint John (vv. 1–14), and, when he finishes, the ministers respond, Deo gratias. So ends the Mass.

Low Mass (Missa privata), in which the celebrant supplies the part of the absent ministers and uses the speaking instead of the singing voice, is a late abridgment. It became a necessity when, in the early Middle Ages, the pious custom grew up for practically every priest to say Mass once a day. By the 9th century we find that many priests were in the habit of saying Mass several times the same day. By the 13th century this multiplication of Masses began to be forbidden. By special indult (1746) of Pope Benedict XIV, priests in Spain and Portugal were permitted to celebrate three Masses on All Souls' Day (2 November), a privilege extended quite recently to all other countries. The rule now is that, except on that day and on the feast of Christmas (25 December), when three Masses are also allowed, and on Sundays and certain holy days when, in case of necessity, authorization for two Masses is given, a priest may say only one Mass a day. Pius the Fifth's Missal (1570) recognized Low Mass and specifically arranged its order. By direction of Pope Leo XIII certain prayers in the vernacular, in which the congregation participates with the celebrant, are recited after every Low Mass. In some countries (e.g., Ireland) the 129th [130th] Psalm (De Profundis) is said after the Low Mass and before the vernacular prayers. There are special rites for a Pontifical Mass, high or low, and additional special rites for a Papal Mass. A Missa Cantata, without deacon and subdeacon, but with celebrant, choir, and singing as at High Mass, is a compromise. The Mass of the

Presanctified (Missa præsanctificatorum, λειτουργία τῶν προηγιασμένων), which is really not a Mass at all but a service of Communion from an oblation consecrated and reserved at a previous celebration, was once common in both the Eastern and the Western Church. In the Byzantine rite such a service still occurs several times in the year, but in the Roman rite it is now used only on Good Friday. Conventual or Chapter Mass (Missa conventualis or capitularis) is an official Mass celebrated in such churches as are bound to have the whole office every day. A Missa solitaria is a Mass said without an assistant. Such Masses, forbidden by many synods, may nevertheless be celebrated by dispensation given under special circumstances. Missa sicca, or dry Mass, was used on occasions when a real Mass could not be said, as, for example, at a wedding or a funeral in the afternoon. It consisted of the prayers of the Mass with the essential parts — offertory, consecration, communion — omitted. Varieties of the dry Mass were Missa nautica, said at sea when the rolling of the ship rendered a real Mass dangerous or impossible, and Missa venatoria, said for hunters. The dry Mass was in vogue from at least the 14th century, but by the end of the 17th century it was nearly entirely abolished. Requiem Mass is said for the dead, and Nuptial Mass (pro sponso et sponsa) for a marriage.

In the early ages the Mass was divided into two distinct parts, the Mass of the Catechumens (Missa catechumenorum) and the Mass of the Faithful (Missa fidelium). This distinction, at one time fundamental, gradually disappeared as the discipline of the catechumenate fell into disuse. It has now long been lost, and the division is so hidden in the present rite that but few people advert to it. The *Dominus vobiscum* and the *Oremus,* following the Gospel (or the Creed, when it is said) and preceding the Offertory Act, show the line of demarcation.

The celebrant of Mass must be in priest's orders and free of irregularity and censure. He must also be in the state of grace, and be fasting from at least the previous midnight. He is bound to observe the rubrics and the laws concerning the matter (azyme bread and pure wine), the vestments, the vessels, and the ceremonies. Mass should be celebrated in a consecrated or blessed church and on a consecrated altar or altar-stone. In special cases, however, it may be said in a private oratory or even in an ordinary room. It is offered in the morning, though, for good and sufficient cause, the time may be extended to a limited period after mid-day.

The two great distinguishing marks of the Roman Mass are (1) that it is a sacrifice and (2) that it supposes Transubstantiation. These were the two features to which the Reformers particularly objected. They took the position that "the Eucharist and Holy Supper of the Lord" was a remembrance of Christ and a solemn setting forth of his death, and not a sacrifice, and that Transubstantiation did not take place. They were anxious, indeed, to retain a Eucharistic service, but one stripped of what to them appeared to be its objectionable parts. They were also insistent that the service should be in the vernacular, and that communion, when administered to the faithful, should be administered under both kinds, that is, in the form of bread and wine, and not of bread alone as was the practice of the Catholic Church. At first they repelled the charge that they were opposed to the Mass, and the Augsburg Confession "protests against any notion that it abolishes Mass"; but the logic of events was too strong for this contention, and ultimately the Reformation, as far as it could, did away with the Mass. In his Latin Mass (1523) and his German Mass (1526) Luther put forth the basis of the numerous liturgies promulgated by his followers in the 16th century. In the former he laid down the principle that "we cannot deny that Mass and the communion of bread and wine is a rite divinely instituted by Christ." He therefore allows the Mass, as it stood in the ancient missals, to be consonant with primitive purity, except the Offertory and the Canon, that is, everything that savored of oblation. He did not recognize Transubstantiation. He developed instead the theory of Consubstantiation, according to which Christ's body and blood are really and corporeally present, during the celebration of the Lord's Supper, in, with, and under the substance of bread and wine, in a union not hypostatic, not of mixture, not of local inclusion, but wholly transcendent and mysterious, so that the elements may with propriety be termed either bread and wine or the body and blood of Christ. Zwinglius and Oecolampadius, and with them the main body of Helvetian Protestantism, went farther. They rejected all notion of a real presence, and recognized only figurative symbols in the elements which Christ had appointed as a commemoration of his death. Bullinger modified Zwinglius's doctrine without changing its essentials, and, by divesting it of its merely commemorative character and admitting the presence in the communion, gave it the form in which it was adopted by the Helvetic churches. Bucer did not acknowledge the local or real presence of Christ's body and blood in the bread and wine after consecration, but contended that the body and blood were really, and without figure, received by the worthy communicant, through faith. Calvin taught that the body of Christ is present in the Eucharist, but "dynamically," not objectively; that the believer partakes of it, but spiritually and by faith; that the elements are unchanged; and that therefore the Catholic Mass is idolatry. In England the Reformers maintained that in the Lord's Supper there is no Transubstantiation and no other oblation than a giving of thanks and a commemoration of the death of the Lord: in other words, that, as Cranmer phrased it, the Roman Mass is "heinous and abominable idolatry." These views found practical expression in the Book of Common Prayer, the first vernacular liturgy of the Church of England, published in the reign of Edward VI, and effective on Whitsunday, 9 June 1549. The Eucharistic part of the service was indeed named "The Supper of the Lorde and holy Communion, commonly called the Masse," but the whole of the oblation and offertory prayers were swept away and the former Canon changed in many of its most material parts. In the second Book of Edward VI, which went into force on 1 Nov. 1552, the word Mass was omitted, and any language in the Canon that might imply either the doctrine

of Transubstantiation or of sacrifice also disappeared. The attitude of the Anglican Church on this subject is crystallized in the 31st of the Articles of Religion: "Wherefore the sacrifices of the Masses, in which it was commonly said, that the Priest did offer Christ for the quick and the dead, to have remission of pain or guilt, were blasphemous fables, and dangerous deceits." Laws were enacted containing severe penalties for saying or hearing Mass. So important did it seem to condemn the Roman sacrifice that, for centuries, the occupant of the English throne was bound by the oath taken at coronation to repudiate the doctrine of Transubstantiation and of the Mass. It was not until 1910 that, by the Accession Declaration Act, the oath was purged of its objectionable clauses.

Modern unbelief, which denies the divinity of Christ and rejects every supernatural institution, does not of course recognize the sacred character of the Mass. Using the so-called historico-religious method, it accounts for the Eucharist and the Eucharistic sacrifice as a result of a spontaneous development in the religion founded by Christ; but this line of argumentation neither explains nor explains away the Mass, and succeeds only in raising still more difficult problems for solution.

Despite all the attacks to which it has been subjected, the Mass remains the great central act of sacrifice in the Catholic Church, the distinctive feature of the Catholic religion, the everlasting witness and guarantee of the bond which unites all Catholics with the Roman See. Catholics are required, under pain of grievous sin, to attend Mass on Sundays and holy days of obligation, unless prevented from doing so on reasonable grounds, such as sickness or too great distance from a church. Some lax Catholics, it is true, shirk their duty in this respect; but the crowded condition of the churches both in town and country in every and during the hours of celebration shows how generally and how generously the law is observed. In practice, multitudes of Catholics hear Mass and receive holy Communion every day.

Bibliography.— The bibliography on this subject is enormous. The following books are tentatively suggested for further study: Bona, 'Rerum liturgicarum libri duo' (Paris 1672); Martène, 'De antiquis ecclesiæ ritibus' (3 vols., Rouen 1700–02); Lebrun, 'L'Explication littérale, historique et dogmatique des prières et des cérémonies de la messe' (Paris 1716–26); Pope Benedict XIV (1740–58), 'De sacrosancto sacrificio missæ libri tres' (ed. Schneider, Mainz 1879); Rock, 'Hierurgia, or the Holy Sacrifice of the Mass' (2 vols., London 1840); Daniel, 'Codex liturgicus ecclesiæ universæ' (4 vols., Leipzig 1847); Probst, 'Liturgie der drei ersten christlichen Jahrhunderte' (Tübingen 1870); 'Die ältesten römischen Sacramentarien und Ordines erklärt' (Münster 1892); 'Die Liturgie des vierten Jahrhunderts und deren Reform' (Münster 1893); 'Die abendländische Messe vom fünften bis zum achten Jahrhundert' (Münster 1896); de Fleury, 'La Messe: études archéologiques sur ses monuments' (8 vols., Paris 1884–89); Gasquet and Bishop, 'Edward VI and the Book of Common Prayer' (London 1890); Gihr, 'Das heilige Messopfer dogmatisch, liturgisch und ascetisch erklärt' (6th ed., Freiburg i. Br. 1897); Magani, 'L'antica liturgia romana' (3 vols., Milan 1897–99); Rietschel, 'Lehrbuch der Liturgik' (2 vols., Berlin 1900); Gee, 'The Elizabethan Prayer-book and Ornaments' (London 1902); Duchesne, 'Origines du Culte chrétien' (3d ed., Paris 1903); Bishop, 'Genius of the Roman Rite' (London 1904); Baumstark, 'Liturgia romana e liturgia dell' Esarcato' (Rome 1904); Warren, 'Liturgy of the Ante-Nicene Church' (New York 1906); Cabrol, 'Les origines liturgiques' (Paris 1906); Yorke, 'The Roman Liturgy' (San Francisco 1906); Nieuwbarn, 'The Holy Sacrifice and Its Ceremonies' (trans. from the Dutch by Bouman, New York 1909); Fortescue, 'The Mass: A Study of the Roman Liturgy' (New York 1912).

P. J. Lennox,
Professor of English Language and Literature, The Catholic University of America.

MASS PRODUCTION. The term *mass production* may be fairly defined as the American contribution to methods of supplying the world's needs. Created by the engineer-owner type of management which is prevalent in the United States, as distinct from the financier type of management, its major developments are more clearly traceable in the industrial history of the United States than elsewhere. The great size to which this facility has grown, the manifold nature of its operations and its prodigious volume and variety of output, foster the impression that mass production is a thing of great complexity, when in reality it represents the principle of extreme simplification as applied to manufacturing processes. Commodities themselves grow more complex—as the electric refrigerator compared with the icebox, or the motorcar compared with the wagon—but to prevent similar complexity reaching unmanageable proportions in the processes by which commodities are manufactured, the simplifying principles of mass production are adopted. Essentially, these consist in dividing a commodity into its constituent parts, defining the operations required to make each part, allocating each operation to its appropriate craft or machine, subassembly of lesser into major parts, and final assembly of the major parts to complete the commodity. This method in its origin and growth is not to be accounted for on any economic theory; it is purely the result of practical men's response to the requirements of the job; and, being yet in process of development, no economic theory thus far formed embraces all its relations and significance.

The principal effect of mass production on business procedure has been to convert industry from the old and relatively safe principle of restricted production for a known market and a calculable profit, to the new and riskier principle of producing for a market not yet in being, which the enterpriser hopes to develop by rendering goods more easily available through the lower prices made possible by the manufacturing economies that are attainable under volume production. The older method was a safer one for investments and permitted adjustment to shrinking markets without great loss, whereas the newer method is so dependent on uninterrupted volume production to at least 75 per cent of capacity, that almost invariably it incurs loss when required to adjust its vast facilities to less

than that volume. In this respect, mass production in the present stage of economic development is more profitable to society at large than to corporations practicing it. It represents a salient thrusting beyond the main line of general economic progress, an exposed position endangered by the failure of other economic factors to make a commensurate advance.

Mass production eliminates none of the older developmental stages of manufacture. The handicraft stage is present in it, the craftsman still reigns supreme in the creation and design of the commodity; but at the point where formerly he was responsible for commodity reproduction also, he is now superseded. Reproduction of the commodity created by the master craftsman is now the function of the machine. Most of the commodities of the handicraft era were simple in form and purpose, employing at most one or two arts. They were later committed to the machine for the sole purpose of accelerating the repetitive process of reproduction. The machine produced more in less time at lower labor cost. During this transition period in American industry the machine became known as a "laborsaving" device or, less euphoniously, a destroyer of employment. But machine production of itself does not constitute mass production.

The earlier years of the machine age were marked by the invention of newer and better methods of rendering old and basic services. In transportation for example, the locomotive and its train were substituted for the horse-drawn stagecoach. But, as in the case of the locomotive, the new service-delivering commodity was invariably more complex than the old, its structure contained more parts, its production involved more arts, and where the most elaborate stagecoach could have been produced by one or two skilled artisans, under no circumstances could a locomotive be commercially produced by merely manual workers however skilled. Like the major proportion of capital goods today, it could not have been produced at all. Consequently, in its later development the machine came to be recognized as "laborserving" rather than "laborsaving," because without it much of the present work of the world could not have been conceived, let alone performed. A million men massed together could build a pyramid but not a 125,000-horsepower steam turbine.

To the stage of creation, design and handicraft, and to the stage of machine reproduction of goods, was added the stage in which industry concentrated on the production of the *parts* of a commodity, constituting each part an industry in itself under one general management for the purpose of producing a particular result. This is mass production. And since it has come to its fullest development and use in the automotive industry and is now applied to the production of airplanes and other military weapons and vehicles, the method may be broadly described as follows: The commodity, say an automobile, is reduced to its major parts—frame, engine, axles, transmission, body, fueling, oiling, cooling, electrical systems, etc.—and each major part reduced to its constituent parts, as say, the engine to its 1,250 parts, or the gearshift to its 40 parts. Each part is separately studied with a view to its most efficient production in quantity and its perfect interchangeability with similar parts, the latter quality being achieved through the control of production processes by precision measurements which in certain instances approximate a ten-thousandth of an inch. This involves planning the layout of the shop so that the minor parts to be assembled into a major part may be conveniently located for easy handling, and so that major parts, when completed, may flow in sufficient quantity and orderly succession and converge at the exact place on the final assembly line where they are needed to give their degree of completion to the total process of assembling a car.

In recent years the number of parts thus involved has greatly increased. In the Model "T" period a car contained about 5,000 parts; the medium price car of today contains between 15,000 and 16,000 parts, depending on the model. Two opposing forces constantly operate within mass production practice: (1) the designer's and engineer's drive toward improvement and refinement which often increases the number of parts in the object improved; and (2) the manufacturer's drive toward fewer and simpler production operations, reducing the number of separate parts by simpler design or by integrating them into the unity of a larger design. To illustrate the first: Until recently the motorist shifted gears by using a lever that protruded from the transmission through the floor board of the car to within reach of the motorist's hand; it was a simple assembly of two parts. Engineers subsequently devised a remote control gearshift operated from the steering wheel and containing 40 parts. By such improvements the number of parts and operations involved in the manufacture of the car often are increased. Illustrating the opposite tendency—the effort to reduce the number of parts and operations—production of a Ford steel crankshaft is a case in point. Formerly the forging of a crankshaft involved 62 fabricating operations. After five years of laboratory incubation and shop experiment with prolonged testing in actual use on 2,000 company service cars and trucks, a cast steel crankshaft was developed which reduced the number of fabricating operations to 54, at the same time reducing the weight, increasing the strength, and diminishing the waste attendant on its manufacture.

The layout of the mass production shop is a series of assembly and subassembly lines resembling the midrib and lateral veins of a leaf or the trunk and limbs of a tree. Each line begins at the edge of a stock pile, whence it takes the material to be shaped or assembled into the part which that particular line fabricates, and moves it along through a series of operations until it is complete. Thus the engine assembly begins with the cylinder block, which moves along the engine assembly line into which lateral or subassembly lines feed camshaft, crankshaft, pistons and rods, valves, flywheel, oil pump, etc., many of which are the product of more remote subassembly lines. For example, the oil pump is the product of a subassembly involving 13 distinct operations by as many men.

To illustrate the number of operations and the successive steps taken to perform them, the process of producing what most laymen would regard as a simple part—a fuel or gasoline tank—is now described.

(4) Placed in a restrike press that reshapes it and pierces drain plug flange hole. (5) Placed on spot welder that welds a reinforcement on end of piece. (6) Inserted in die that pierces four holes in piece. (At this point a feedline tube assembly arrives from an auxiliary line which represents six operations.) (7) Gas feedline outlet is riveted onto the piece. (8) Drain outlet flange is riveted on. (9) Tube of feedline is securely spot-welded to tank bottom. (10) Piece is placed on table. (11) Is hung on overhead conveyor which carries it to solder line. (12) Twelve men solder hardware on the piece. (13) It is then placed on overhead conveyor, carried through automatic wash of soda ash solution, to oxidize the acid, thence through a fresh water wash, lastly through a drying oven. (14) Piece removed from conveyor, placed on assembly table. The process thus far has engaged 28 men.

In the meantime the sheet forming the upper half of the fuel tank has been proceeding along a parallel line through similar operations, requiring 30 men, meeting lower half at the assembly table. At this point (15), upper and lower half of tank are assembled, spot-welded and seam-welded at ends. (16) Seam-welded on sides. (17) External reinforcements are spot-welded to one side of tank. (18) Reinforcements spot-welded to opposite side. (19) Same reinforcements spot-welded to flange of tank. (20) Five holes pierced to attach tank to car frame. (21) Double spot-welding of nuts and nut retainers that attach tank to frame. (22) Tank moves by conveyor to water test where six men give it a five-minute test for leaks under 20-pound air pressure. (23) Belt conveyor passes tank before line of four inspectors. (24) Four men apply antirust oil to threads of nuts. (25) Two men hang tank on conveyor which delivers it to final assembly line where it takes its place in the car. This second series of operations engages 35 men.

The making of a fuel tank requires 27 parts, 55 operations (10 minor motions in additions to those just described), and 93 men. From this it may be seen how many more operations and men are involved in the making and assembly of a complicated part such as a motor or a rear axle. The effect of the process is to make every part not only instantly interchangeable but also of uniform quality, neither of which is possible by any other process.

As to the effect of mass production on employment, the number of jobs normally established and the number of persons normally employed in proportion to the population has steadily increased from the time machines first came into industrial use. In 1870 the work of 324 persons per 1,000 population was required to supply goods and services; in 1930, with the machine predominant, 400 persons out of every 1,000 were similarly employed. In the meantime, 20 great new industries, entirely impossible without machinery, had sprung into existence. The experience of the Ford Motor Company, with all its expert efficiency in decreasing the number of men required on specific jobs, is that the number of man-hours of labor per car produced has steadily increased.

American business management always has been the focus of two seemingly irreconcilable demands, that of the consumer for higher quality at lower prices, and that of the employee for a higher wage and a shorter workday. Previous to about 1900, managerial ability was measured by the dexterity with which these two demands could be balanced one against the other. Wages would be reduced or the workday lengthened and the difference used to improve the quality or reduce the selling price of goods, until employee protest made a change of policy advisable; or, on the opposite course, the quality of goods was lowered or the price increased and the difference applied to wages, until consumer protest and loss of trade compelled abandonment of that makeshift. About 1900 there appeared on the American scene a more modern and competent type of business management that studied these apparently antagonistic demands and, recognizing both to be just, concluded they were therefore practicable. Thereupon, management developed methods—the beginnings of mass production—that eliminated waste of time and materials and increased the output, enabling employees to *earn* a higher wage by more efficient work in fewer hours, and consumers to buy better goods at lower prices. With that reform a new era began in American business and it is now nowhere questioned that in the United States the consumer may purchase more value at lower cost and the employee earn a higher wage for less hard labor than anywhere in the world.

On a superficial view it sometimes seems that mass production methods reduce employment. That may be the result in a given job, but the reverse is true of the total volume of industrial employment. How it works out in practice may be seen by a study of an insignificant item, the inner shell of the hubcap of a motorcar. Made by machinery this article costs 12-and-a-fraction cents. Made by hand at 1929–1938 wage rates, it would cost $2.50. A machine will produce 2,610 hubcap shells while the handworker is hammering out one. To produce by hand the number required for one day's normal output of motorcars would require the employment of about 5,000 men. The uninformed conclusion is that this machine throws 5,000 men out of work. The fact is that had the hubcap shell been made by hand, it would indicate a stage of progress in which everything else pertaining to a motorcar would also be made by hand, and therefore a stage of progress in which neither these 5,000 men nor the other 350,000 men engaged in fabricating automobiles could have been employed in any mass production industry. And the 24 years of employment at $7 a day that went into the construction of that hubcap-making machine would not have been possible. A handmade Ford car would cost at least $17,850, and at that price there would be no automotive industry. It was by economies, such as making this hubcap shell by machinery, that a motorcar at a payable price was made available to the general public and an industry established that gave vast direct and indirect employment. Labor economies do not mean unemployment. The typewriting machine invaded a business world that wrote its correspondence and kept its accounts with a pen; instead of reducing office employment, the typewriting machine opened a new profession for tens of thousands who otherwise could not have worked in offices, and in addition employed tens of thousands of mechanics in making typewriters, cash registers, and comptometers. Nor did it in-

jure the pen and pencil busines—witness the growing manufacture of fountain pens and patent pencils.

The stimulating effect of the typewriting machine on what would seem to be its rivals, the pen and pencil, indicates a law of business that even mass production has not altered, namely, that nothing useful is ever superseded. When oil came in as an illuminant, some prophesied the disappearance of candles; probably more candles are manufactured today than when they were the main source of artificial lighting. When gas came, it seemed to be the end of oil; more oil is produced for more uses today than ever before. Then electricity arrived and gas seemed to be doomed; today more gas is manufactured and used for more purposes than in the heyday of the gaslight. By all logic, the stove should have abolished the fireplace, but the fireplace is commoner today in domestic architecture than at any time in half a century. House furnaces should have superseded the stove, but now besides the furnace business and the continued manufacture of coal and wood stoves, there is a flourishing business in oil, gas, and electric stoves. The automobile did not abolish the bicycle; in a recent year more bicycles were made than in any other year of bicycle history, and the industry experienced in 1942 another boom due to wartime conditions. The motorcar outmoded the horse as a means of motive power, which should have spelled the end of the blacksmith shop; but towns that had one or two blacksmith shops now have from four to ten garages. New business does not extinguish useful old business, and mass production, instead of destroying old business, has presented it with the means to insure its survival. The great mass production industries, with their reliance on tens of thousands of smaller industries as suppliers, have had the effect of increasing rather than diminishing the amount of individual business enterprise in the country.

The effect of mass production on the employee may be stated as follows: it enabled him for the first time to become a consumer of the goods he makes; it prolongs his effective working life by practically eliminating the strain of hard physical labor; it increases his technical skill by its higher requirements of workmanship and by the variety of his experience with technical processes. Contrary to a view assiduously and academically disseminated, mass production requires a high degree of mass skill. In a total of 74,282 employees in one Ford factory, 12,258, or 16.5 per cent, are highly skilled men. This percentage of skilled men is much higher than could have been found among the people of the handicraft period. The percentage of semiskilled men also runs higher under mass production than under the previous system. And unskilled labor is enabled to *earn* a higher wage than it ever was paid before. The presence of modern machines imparts to the men who manage them some of the skill that went to their making. Every tool enshrines the craft and experience of the men who developed it, and transmits something of these values to those who work with it. It is not accidental, therefore, that in the United States where mass production has reached its widest use, technical skill among the people is more prevalent than in any other country.

The extent to which the mass production technique could be used to arm a nation quickly and effectively was widely recognized at the advent of World War II, and in the United States the automotive industry was called upon to play a very important part in the war effort. A good example of the application of mass production technique to production of war material was the Willow Run bomber plant, 35 miles west of Detroit, where 8,685 four-engine bombers of the B-24 Liberator type were manufactured and assembled. Willow Run's greatest contribution to the war effort was the demonstration that automobile-type mass production of airplanes is actually the method best suited for incorporating constant modifications.

There had never been any doubt that mass production of airplanes would be less costly in time and manpower, if engineering changes could be frozen. Willow Run, however, proved that engineering changes could be incorporated into new planes faster in a mass-production setup than in the more conventional airplane manufacture. It was also demonstrated that the mass production technique is in fact a very flexible system; this was shown by the elimination of the greater part of modification center work, by incorporating into original production the diverse parts required. Again, this plant demonstrated the close control on quality that the mass production technique permits.

The future of mass production is definitely determined. Automatic machinery will greatly increase in variety and use. This, not with the impossible purpose of making human beings obsolete in industry, but as the result of an inescapable evolution which will enhance economic supply and liberate human brain and brawn to the long overdue cultivation of new and waiting fields. See also INDUSTRIAL DESIGN.

EDSEL FORD,
Revised by Henry Ford II, President, Ford Motor Company.

MASSA, mäs'sä, or **MASSA DI CARRARA,** town in Tuscany, Italy; capital of the province of Massa e Carrara; on a hill three miles from the Gulf of Genoa, 25 miles north of Pisa and 20 miles southeast of Spezia. It is an episcopal see, has a cathedral, public library, and academy of arts and sciences, and an ancient ducal palace now used as the prefectual building. The chief industry is the quarrying of the superior white marble in the vicinity; tobacco, silk, cotton, paper, and oil are manufactured. Massa was once the capital of the principality of Massa and later capital of the duchy of the same name, but since 1870 it has been in the state of Tuscany. Pop. 41,800.

MASSACHUSET, mäs-a-choo'set, a tribe of North American Indians of the Algonquian stock, formerly living in the neighborhood of Massachusetts Bay, between Salem and Plymouth. Their capital, Massachuset, was where Quincy now stands. A pestilence in 1617 greatly reduced their number and on the arrival of the white settlers the tribe numbered but a fraction of its former hosts, about 500. In 1633 this number was further depleted by the ravages of smallpox. They were placed by the whites in the missions of Natick, Nonantum, and Ponkapog in 1646 and gradually disappeared. See ALGONQUIN; INDIANS.

MASSACHUSETTS, one of the original thirteen states of the United States. The name is derived from that of an Algonquian confederacy which inhabited the region of Massachusetts Bay. It appears to be compounded from the Algonquian words, *massa* (great), *wadchu* (hill), and *set* (near), meaning "near the great hill," which probably refers to the Blue Hills near Quincy, which was the site of the confederacy's capital. It is bounded on the north by New Hampshire and Vermont, on the west by New York, on the south by Connecticut, Rhode Island, and the Atlantic Ocean, and the east by the Atlantic Ocean. The main portion of the state is

approximately 130 miles from east to west; the width from north to south is 110 miles at the widest parts and in the west is 48 miles.

Physical Characteristics.—*Topography.*—The topography of Massachusetts may be described in four regions: western mountains, the Connecticut Valley, central plateau, and eastern lowlands. The mountains in the west, known as the Berkshire Hills, run north and south across the state and are a southern extension of the Green Mountains of Vermont, themselves a part of the Appalachian system. In the extreme west, along the border of New York State, lies the Taconic Range, which reaches an elevation of 3,491 feet in the northwest at Mount Greylock, highest point in the state, and 2,603 feet at Mount Everett in the southwest. East of the Taconic Range lies the picturesque Berkshire Valley, in which are located a number of manufacturing centers, chief of which is Pittsfield, and also residential towns which are noted as summer resorts. The Berkshire Hills to the east comprise a succession of ridges, the highest being the Hoosac Range, which reaches 2,588 feet at Spruce Hill. There is some farming, chiefly on the plateaus, but this region is noted chiefly for its scenic beauty and as a summer resort. The mountain barrier has tended to isolate Massachusetts from the region to the west, with the result that the state faces to the east and south and tends to remain, along with the rest of New England, a distinctive region. East of the Berkshire Hills the broad Connecticut Valley extends across the state from north to south. Here the deep, alluvial soil and the high summer humidity provide rich crops of tobacco, onions, and potatoes. Several manufacturing centers, such as Springfield, Holyoke, and Chicopee, are located in the valley. Dominant features of the landscape here are the traprock ridges which have resisted erosion and which rise sharply from the valley to peaks such as Mount Tom (1,202 feet), Mount Holyoke (878 feet), and Mount Toby (1,269 feet). The central plateau east of the Connecticut is a southern extension of the White Mountains of New Hampshire. It is a hilly and largely wooded region with an elevation of about 1,100 feet in the central portion, but with some higher peaks such as Mount Wachusett (2,006 feet). East of this plateau the hills slope away to a coastal lowland which was once submerged beneath the sea. The highest point along the coast is the Great Blue Hill of Milton (635 feet). In the eastern region are located most of the population centers, constituting roughly three fourths of the state's population. The shoreline is rocky and picturesque in the north and sandy to the south, and is deeply indented by bays such as Massachusetts Bay, Cape Cod Bay, and Buzzards Bay, and by many inlets. The hook-shaped Cape Cod Peninsula in the southeast, about 65 miles in length, was formed by glacial moraine, as also were the islands of Martha's Vineyard, Nantucket, and the sixteen Elizabeth Islands, which are part of the state. The region with its mild climate, beautiful beaches, and fine harbors for sailing is one of the principal summer resort areas of New England.

Climate.—Lying in the middle of the temperate zone, Massachusetts is in the area of recurrent conflicts between cold, dry air masses flowing from the northwest and the warmer, moisture-laden air from the south. The resultant disturbances bring storms and weather changes at fairly frequent intervals. The prevailing winds are from the northwest in winter and south to southwest in summer. Heavy snowstorms in winter often occur with northeasters. Winters are long, leading to short spring seasons, with fairly warm summers, and cool, bracing fall weather. Along the eastern and southern shores the climate is tempered by the ocean, being milder in winter and less oppressive in summer than in the interior. The average January temperature at Williamstown in the northwest is nearly 23°F., while at Boston it is about 30°F., and on Nantucket 32.6°F. The average July temperature is near 70°F. throughout most of the state. The highest tem-

perature recorded is 106°F. and the lowest —28°F. Average dates for the last killing frost in spring are two to three weeks earlier in coastal areas than in the interior and correspondingly later in the fall, so that there is considerable variation in the growing season. Precipitation in most areas exceeds 40 inches annually, with 48 inches as the highest average at any station, and it is rather evenly distributed throughout the 12 months. There is little permanent snow cover along the coast, but in mountain areas snow lies deep all winter.

Rivers and Harbors.—Rivers have played an important part in the history of the state, but primarily as sources of waterpower for manufacturing and the production of electricity, rather than for navigation. The fact that no important river flowed eastward from the center of the state retarded settlement in that region, and early settlers in the Connecticut Valley ascended that river from Long Island Sound. The Connecticut River is navigable in the state only by small boats, but is a valuable source of power. Tributaries from the west are the Deerfield and Westfield rivers, and from the east the Millers and Chicopee rivers. The Berkshire Valley is drained to the south by the Housatonic River, which empties into Long Island Sound, and to the north by the Hoosic River, which flows into the Hudson. The Swift River valley in the central plateau has been dammed to form the large Quabbin Reservoir. Farther east, the Merrimack River rises in New Hampshire and flows for 35 miles through the northeastern corner of Massachusetts; it is navigable by small boats for about 17 miles from Newburyport to Haverhill, but is valuable chiefly as a source of power for the industrial cities of Lowell, Lawrence, and Haverhill. The Concord River empties into the Merrimack, and the Charles River flows into Massachusetts Bay at Boston. In the southeastern part of the state the Blackstone River, valuable for waterpower, and the Taunton River drain into Narragansett Bay. Scattered throughout the state are many small lakes and ponds, mostly of glacial origin. In the Cape Cod region many glacial depressions with rich, peaty soil serve as cranberry bogs.

Massachusetts is fortunate in having many excellent harbors, which help to account for its early eminence in shipping. Along the eastern shore are the harbors of Boston, Lynn, Marblehead, Salem, Gloucester, Newburyport, Plymouth, and Provincetown. Boston and Provincetown accommodate the largest ocean-going vessels. On the south shore are the important harbors of New Bedford on Buzzards Bay, and Fall River on Narragansett Bay.

Political Divisions.—*Counties.*—The state is divided into fourteen counties. Nantucket with an area of 46 square miles and (1950) 3,484 persons is the smallest. Worcester County has the largest area (1,532 square miles) and Middlesex the greatest population (1,064,569). The counties and their county seats are as follows:

County	County Seat
Barnstable	Barnstable
Berkshire	Pittsfield
Bristol	Taunton, Fall River, and New Bedford
Dukes	Edgartown
Essex	Salem, Lawrence, and Newburyport
Franklin	Greenfield
Hampden	Springfield
Hampshire	Northampton
Middlesex	Cambridge and Lowell
Nantucket	Nantucket
Norfolk	Dedham
Plymouth	Plymouth
Suffolk	Boston
Worcester	Worcester and Fitchburg

Cities and Metropolitan Areas.—Massachusetts in 1950 had 39 places incorporated as cities, with 2,500 inhabitants or more, and 114 unincorporated places of 1,000 population or more. The cities ranged in size from Newburyport, with a population of 14,111, to Boston, with 801,444 residents. According to the 1950 census, Massachusetts had more cities with populations of over 50,000, 17 in all, than any other state except California, which had 19. Besides Boston, cities of more than 100,000 are: Cambridge, Fall River, New Bedford, Somerville, Springfield, and Worcester. In addition to those mentioned above, cities of more than 50,000 residents are: Brockton, Holyoke, Lawrence, Lowell, Lynn, Malden, Medford, Newton, Pittsfield, and Quincy. (For populations of these and other cities, see individual articles and the back of the state map.)

The Bureau of the Census in 1950 designated nine metropolitan areas within Massachusetts. These were Boston, Brockton, Fall River, Lawrence, Lowell, New Bedford, Pittsfield, Springfield-Holyoke, and Worcester. The Boston area comprised the entire Suffolk County, 9 cities and 19 towns in Middlesex County, 4 cities and 10 towns in Essex County, 1 city and 16 towns in Norfolk County, and 2 towns in Plymouth County.

The Boston metropolitan area, with a population of 2,369,986 in 1950, compared with 2,177,621 in 1940, ranks as the sixth most populous in the United States. The area is also one of the nation's largest wholesale centers, a leader in per capita retail sales, one of the outstanding industrial centers, and a leading educational center. Its activities include the usual industries associated with a large population center, with more than ordinary emphasis on confectionery, drugs, chemicals, sugar refining, soap, plastics, printing and publishing, electrical machinery, and other fine metal products.

The Lowell and Lawrence metropolitan areas, located in the Merrimack River valley, have long been centers for extensive textile manufacturing, including cottons, woolens, and worsteds. Other manufactures include such diversified products as boots and shoes, hard rubber products, soap, and plastics, as well as dyeing and finishing processing.

The Fall River and New Bedford metropolitan areas, located on the southern shore of the state, have climatic conditions which gave the area an early lead in the manufacture of fine cotton goods, in addition to marine equipment. In recent years, however, there has been a tendency towards diversification into other fields, such as dyeing and finishing, leather goods, rubber goods, and fine metal products, including copper, brass, and silverware.

Located in the Connecticut River valley, the Springfield-Holyoke metropolitan area ranks high in the manufacture of paper and textiles of all kinds, rubber goods, games and toys, fine metal products, and light machinery, including firearms and electrical equipment.

The Worcester area of central Massachusetts, located along the Blackstone River, is also noted for its diversity of industries, including machine tools, steel and wire products, tex-

tile machinery, grinding machines, firearms, woolens and worsteds, carpeting, and clothing.

The People.—The population is approximately three fifths native, one quarter foreign-born or of mixed foreign-born and native parentage, and one eighth from other states. More than 98 per cent is of the white race (98.6 per cent white; 1.3 Negro; and 0.1 other). Almost one fourth of the foreign-born persons of the state reside in Suffolk County and more than one fifth in Middlesex County. The Irish Free State (Ireland) has contributed more than one hundred thousand (103,388) of the foreign-born population and a large percentage of this group live in the metropolitan areas.

The population of Massachusetts increased from 378,787 in 1790 to 4,690,514 in 1950. During the earlier years of this period the percentage rate of growth was slightly over 10 per cent each decade. The rate of growth reached its peak during the decade 1850–1860 with an increase of 34.8 per cent. From 1880 to 1910 the growth rate was approximately 25 per cent for each decade. After that it tapered off rapidly and for the decade 1930–1940 was only 1.6 per cent. Official United States census figures indicate a resumption of the upward trend in population growth at the rate of approximately 8.7 per cent for the decade 1940–1950.

During colonial days Massachusetts was typical in that its population was predominantly rural. The percentage of rural population decreased steadily from 86.5 per cent of the total in 1790 to 9.8 per cent in 1930. Thus Massachusetts has become a predominantly urban state with about 90 per cent of its population living in urban areas. The United States census of population for 1950 indicated a reversal in this trend, with people moving into rural areas and commuting to their urban places of employment. In 1950 the rural population was 15.6 of the total.

Famous Men and Women.—Massachusetts, as one of our original colonies, has produced many statesmen and patriots. Among them are Benjamin Franklin (Boston, 1706–1790), statesman, printer, author, and scientist; Israel Putnam (Salem Village, now Danvers, 1718–1790), American Revolutionary soldier; Samuel Adams (Boston, 1722–1803), American Revolutionary patriot and statesman, delegate to 1st and 2d Continental Congresses, signed Declaration of Independence, and became governor of Massachusetts; James Otis (West Barnstable, 1725–1783), American Revolutionary statesman, a leader in upholding the colonial cause; Artemas Ward (Shrewsbury, 1727–1800), American Revolutionary general; John Adams (Braintree, now Quincy, 1735–1826), 2d president of the United States and signer of the Declaration of Independence; Paul Revere (Boston, 1735–1818), silversmith and patriot; John Hancock (Braintree, now Quincy, 1736/7–1793), merchant, statesman, first signer of the Declaration of Independence, and first governor of the State of Massachusetts; Elbridge Gerry (Marblehead, 1744–1814), statesman, member of Massachusetts Provincial Congress and Continental Congress, a signer of the Declaration of Independence and also of the Articles of Confederation, was governor of Massachusetts and vice president of the United States under James Madison; and John Quincy Adams (Braintree, now Quincy, 1767–1848), 6th president of the United States, and representative in Congress for many years thereafter.

Among the many men and women notable in the world of literature who were born in the state are: William Cullen Bryant (near Cummington, 1794–1878), poet, editor and co-owner of the New York *Evening Post* for almost 50 years; William Hickling Prescott (Salem, 1796–1859), historian, essayist, author of the *History of the Conquest of Mexico;* George Bancroft (Worcester, 1800–1891), historian and statesman; Ralph Waldo Emerson (Boston, 1803–1882), essayist and poet; Nathaniel Hawthorne (Salem, 1804–1864), novelist; John Greenleaf Whittier (Haverhill, 1807–1892), poet, editor, and ardent abolitionist; Oliver Wendell Holmes (Cambridge, 1809–1894), teacher of anatomy, poet, and essayist; Edgar Allen Poe (Boston, 1809–1849), poet and writer of short stories; Sarah Margaret Fuller (Cambridgeport, 1810–1850), journalist and critic; John Lothrop Motley (Dorchester, 1814–1877), historian and diplomat; Richard Henry Dana (Cambridge, 1815–1882), lawyer, specializing in admiralty cases, and author of *Two Years Before the Mast;* Henry David Thoreau (Concord, 1817–1862), essayist, naturalist, and philosopher; James Russell Lowell (Cambridge, 1819–1891), poet, essayist, editor, and diplomat; Edward Everett Hale (Boston, 1822–1909), Unitarian minister and author of the well-known short story *The Man Without a Country;* Francis Parkman (Boston, 1823–1893), historian and author of *The California and Oregon Trail,* as well as other histories of early America; Emily Elizabeth Dickinson (Amherst, 1830–1886), poet, none of whose poems (except two) were published during her lifetime; Horatio Alger (Revere, 1834–1899), author of more than 100 popular books for boys; and Henry Brooks Adams (Boston, 1838–1918), assistant professor of history at Harvard, editor of the *North American Review,* and author of many books of biography and history.

A few of those who became famous in the field of art are: John Singleton Copley (Boston, 1738–1815), portrait painter; Samuel McIntire (Salem, 1757–1811), architect and wood carver, designed many of the houses and public buildings in old Salem; Charles Bulfinch (Boston, 1763–1844), architect of Massachusetts State House on Beacon Hill and designed many public buildings in Boston, also completed the Capitol in Washington, D.C.; John Rogers (Salem, 1829–1904), sculptor well known for his Civil War groups; James Abbott McNeill Whistler (Lowell, 1834–1903), painter and etcher; and Winslow Homer (Boston, 1836–1910), painter, known especially for his paintings of the sea.

Among Massachusetts-born inventors are Eli Whitney (Westboro, 1765–1825), inventor of the cotton gin and firearms parts; Samuel Finley Breese Morse (Charlestown, 1791–1872), artist and inventor of the telegraph; Elias Howe (Spencer, 1819–1867), inventor of the sewing machine; and Francis Blake (Needham, 1850–1913), inventor and physicist, whose telephone transmitter was purchased by the Bell Telephone Company.

Others who have become famous for various reasons are: Cotton Mather (Boston, 1662/63–1727/28), Puritan clergyman, scholar, and author; Horace Mann (Franklin, 1796–1859), educator, who revolutionized public school organization and teaching; Lucy Stone (West Brookfield, 1818–1893), reformer and pioneer in woman's rights; Clara Barton (Oxford, 1821–1912), philanthropist and Civil War worker, through whose efforts the American Red Cross was established; Charles William Eliot (Boston, 1834–1926), president of Harvard (1869–1909), and one of the most influential leaders in educational activities in this country; Samuel Pierpont Langley (Roxbury, 1834–1906), airplane pioneer and astronomer; Lyman Abbott (Roxbury, 1835–1922), clergyman, editor, and author, who became associated with Henry Ward Beecher and succeeded him as pastor of the Plymouth Congregational Church in Brooklyn; Phillips Brooks (Boston, 1835–1893), Episcopal bishop and a great preacher, rector of Trinity Church of Boston; Dwight Lyman Moody (Northfield, 1837–1899), a layman who became one of the world's great evangelists; Oliver Wendell Holmes (Boston, 1841–1935), son of the essayist, associate justice of the United States Supreme Court for 30 years; Luther Burbank (Lancaster, 1849–1926), plant breeder and originator of many new varieties of fruit, flowers, and vegetables; Nathaniel Carl Goodwin (Boston, 1857–1919), favorite comedian of the 1880's and 1890's; and Otis Skinner (Cambridge, 1858–1942), actor.

Others of national fame who, by residence or work in Massachusetts, have brought distinction to the state are: John Eliot (1604–1690), missionary to the American Indians and founder of the Praying Towns in Massachusetts; Mary Morse Baker Eddy (1821–1910), founder of the Christian Science Church and author of *Science and Health;* Louisa May Alcott (1832–1888), author of *Little Women* and other novels; Henry James (1843–1916), novelist, who claimed Cambridge as his American home; Edwin Austin Abbey (1852–1911), mural painter, who did the *Quest of the Holy Grail* series for the Boston Public Library; and John Singer Sargent (1856–1925), portrait painter and mural artist who also did a series of murals for the Boston Public Library.

Natural Resources.—*Fauna.*—Cape Cod deflects the Gulf Stream in such a way that the water to the south is much warmer than that to the north, and thus the state is a meeting place for many southern and northern species of fauna and flora. For example, southern fishes and other marine life are found in the water south of the Cape, including the Portuguese man-of-war, whil

the water to the north is inhabited by entirely different ocean faunas. Whales are occasionally sighted off the coast or washed up on the beach. Fish caught in the lakes and rivers and along the coast include bass, rock bass, bluefish, butterfish, carp, catfish, cod, eel, flounder, haddock, hake, halibut, herring, mackerel, perch, pickerel, salmon, smelt, sturgeon, swordfish, and trout. The shellfish include clams, lobsters, oysters, scallops, and shrimp.

The deer population has increased in recent years and is now quite abundant. Cottontail rabbits and gray squirrels are plentiful. Muskrat, mink, skunk, raccoon, weasel, otter, bobcats, red fox, and gray fox are fur-bearing animals to be hunted.

A large variety of water, marsh, and shore birds find their homes along the seacoast and streams. The best known of the long-winged swimming birds are the gulls and terns. The ring-necked pheasant, ruffed and Whitlow grouse, and the heather hen are among the ground dwelling, scratching game birds to be found. Among the birds of prey are the eagle, turkey buzzard, and many members of the hawk and owl families. The perching birds include the lark, starling, bluejay, bobolink, cowbird, blackbird, meadowlark, oriole, rusty blackbird, grackle, and twenty varieties of sparrows.

Flora.—A wide variety of plants may be found. There are the marsh grasses, sedges, and rushes of the seacoast; the skunk cabbage, white hellebore, marsh marigolds, white and blue violets in the low marshy parts of the uplands; the Solomon's-seal, Canada mayflower, ferns, and trilliums as well as azalea, rhodora, mountain laurel, dogwood, and viburnum on the drier slopes of the uplands. The state is the northern limit for the holly and tupelo.

Minerals.—Although important mineral resources are not associated with Massachusetts and the deposits are predominantly nonmetallic, many of the metals, including gold, silver, copper, manganese, iron, nickle, tin, and leads, have been found. The nonmetallic minerals include alum, asbestos, barite clay, kaolin, fuller's earth, anthracite, lignite, and bituminous coal, corundum, emery, cyanite, feldspar, fluorspar, garnet, graphite, lime, spodumene, mica, ocher, sienna, peat, pyrite, building and paving sand, building gravel, silica, granite, limestone, marble, sandstone, trap-rock, talc, soapstone and several of the less rare gem stones such as the aquamarine cheastolite, jasper, rhodonite, spinel, and tourmaline.

Forests.—Originally almost all the land of the state except Cape Cod was covered with dense forests. The forest area now includes more than three million acres which is over 60 per cent of the total land area of the state. The natural forests can be classified as the pine-oak region on Cape Cop, Nantucket, and Martha's Vineyard, the central hardwood region in the eastern part of the state, the white pine-transitional hardwood region in the central area, the spruce in the northwestern area, and the northern hardwood in the far western part of the state. The largest forested areas are in the western area which has a scattering of pine and hemlock in addition to the deciduous forest of maples, birches, beeches, and oaks.

Soils.—Massachusetts has a large variety of soils among which can be found those suitable for all crops climatically adapted to the area. Of the five million acres of land in the state 210,000, or 4.1 per cent, are suitable for intensive agriculture; 1,580,000 acres, or 31.2 per cent, are suitable for extensive agricultural purposes; while the remaining 64.7 per cent is adaptable for nonagricultural uses and is mainly covered with forest growth.

Siliceous rocks particularly granites, gneisses, schists, and quartzites predominate in the parent rock material of Massachusetts soils, and largely account for their sandy texture. In the Berkshire region which constitutes the western end of the state, limestone formations have improved the quality of the soils.

Continental glaciation thousands of years ago rejuvenated and redistributed the pre-existent soil mantle, added freshly ground rock material, and softened a previously harsh landscape. In the period which has elapsed since the last invasion of an ice sheet, generous precipitation, aided by a cool climate, has caused Massachusetts soils to be leached of the soluble elements thereby producing podsolic soils. Three hundred years of exploitative farming have further depleted the soils in some places of plant nutrients, particularly lime, potash, and nitrogen.

Thus, with the exception of those strongly influenced by limestone and those formed on recent alluvial and lacustrine deposits, Massachusetts soils have only low to moderate native fertility. However, these soils respond quickly and readily to good management. The addition of lime, organic matter, and commercial fertilizer makes it possible to maintain a high level of fertility.

Waterpower.—One of the state's important resources is its natural system of over 4,000 miles of rivers and more than 1,100 lakes. All or parts of 19 river systems, excluding the coastal streams, provide ample water supplies for domestic, recreational, and industrial purposes. The largest of the lakes, Quabbin Reservoir, 24,704 acres, and Wachusett Reservoir, 4,160 acres, are man-made and provide metropolitan Boston with an excellent supply of water.

Plentiful water resources have played an important part in the successful industrial development of the state throughout its entire history. During its earlier years small factories and mills were located along the streams in order to harness the waterpower directly for driving the machines. These streams also provide an abundance of soft water for processing purposes. While much of the state's industry still tends to locate on or near streams especially those requiring water for nonpower purposes, the machines are no longer driven directly by waterpower, but by electricity, much of which is generated in turn by waterpower.

With the coming of the electrical era most of the state's waterpower facilities have been converted to generate hydroelectric power. Most of the hydroelectric plants, representing a capacity of over 400,000 horsepower, are located on the Connecticut River and its tributaries in the western half of the state. It is estimated (1948) that the potential undeveloped waterpower is slightly over 100,000 horsepower.

Parks, Preserves, Reservations, and Other Points of Interest.—The state has acquired through public and semipublic agencies more than 266,000 acres of land which is devoted to outdoor recreation. Of this amount almost 80 per cent is controlled by state agencies while municipal park and forest lands comprise about 19 per cent.

There are 184 recreational areas owned and administered by the state. Divisional administration within departments makes a total of 16 administrative units in control of these recreational areas. The department of conservation, through four of its five divisions, administers 106 of these areas and is therefore obviously the major agency from the standpoint of administration.

The state possesses four state parks: the John C. Robinson, Joseph Skinner, and Lindon-Bates parks in western Massachusetts, and the Roland C. Nickerson State Park on Cape Cod. These comprise approximately 3,388 acres and are maintained by the division of parks and recreation. The division also has authority over Salisbury Beach with four miles of unexcelled beach at the extreme northeasterly end of the state, and Standish Monument in Plymouth which has an observation tower and excellent picnic grove.

Of approximately 172,000 acres of state forests, almost 103,000 acres are included in the 28 forests where provision has been made for outdoor recreation. A majority of this area is in the western part of the state. The division of forestry has charge of 47 state forests which are devoted to scientific forest practice and wildlife management.

The division of wildlife research and management administers 13 wildlife sanctuaries comprising 3,671 acres. In addition 15,577 acres in 18 state forests have been set aside as wildlife refuges.

The division of fisheries and game administers four game farms of 364 acres and six fish hatcheries and two breeding pond systems of 853 acres. These areas are devoted to the scientific propagation of various types of small game and fish for stocking purposes and experimentation. The division also has leased 75 miles of public fishing waters in southern, central, and western Massachusetts. These waters are stocked and offer fine fishing.

There are eight state reservations of 13,546 acres which are developed for recreational purposes. Four of these areas are administered by special unpaid commissioners appointed by the governor while the other four are under the jurisdiction of the commissioners of the county or counties in which they are located.

The state is rich in places of historical interest and merit. The Pilgrim and Puritan settlements of the 17th century, the scenes of memorable occasions of the Revolutionary period, and the literary achievements of such men as Emerson, Thoreau, and Hawthorne during the 19th century are great contributions to the history of our country. Among places of historical interest are the monument at Provincetown which marks the first landing of the Pilgrims; Plymouth Rock at Plymouth; the Myles Standish Monument at South Duxbury; Bunker Hill Monument in Charlestown; the Salem Maritime National Historic Site in Salem; the Old State House, the Old South Meeting House, the Old North Church, and Faneuil Hall in Boston; and the battlegrounds of Lexington and Concord. The historic town of Deerfield and the restored Fort Massachusetts at North Adams have significance in the history of the French and Indian Wars. The homestead of William Cullen Bryant in Cummington is now maintained by the state.

Production and Manufactures.—*Agriculture.*—While Massachusetts is the third most densely populated state in the Union with more than 550 inhabitants per square mile, over 90 per cent of the people are crowded into thickly settled areas which constitute only 5 per cent of the space. Thus, 95 per cent of the state is open rural countryside where the remaining 10 per cent live comfortably at an average of only 50 people per square mile.

Approximately 70 per cent of the 100,000 families living in the rural areas, reside there for residential purposes only. They depend entirely on nonagricultural income, except for small subsistence enterprises such as backyard gardens and flocks. Another 10 per cent, or 10,000 rural families, are part-time farmers who depend partly on farming for their income and partly on nonagricultural employment or income. The remaining 20 per cent of the families (about 20,000) living in the rural areas are commercial farmers who are entirely dependent on farm income.

The latter two groups above make up approximately 30,000 farms which the United States Bureau of the Census has reported since 1920. Although there has been little change in the actual number of people living in the rural areas during the past 150 years, recent developments, including the automobile and improved roads, indicate that there is a trend toward increased numbers living in the rural areas and commuting to their work.

At the same time the number of commercial farms are growing less as the average size of each farm is increasing. This reflects the need for larger units in order to operate efficiently the expensive equipment which is required for mechanized farming.

Approximately 40 per cent of the land is in farms. The state ranks as one of the lowest in farm tenancy with almost 95 per cent of the farms operated by their owners.

The agricultural industry, with an output valued at almost 200 million dollars (192.5 million in 1946), ranks fourth among the industries of the state, being exceeded only by textiles, boots and shoes, and electrical machinery. Agricultural output during and since World War II is at the highest level in the history of the state.

The principal farm products in the order of their importance are poultry and poultry products, dairy products, vegetables, fruits (principally apples and cranberries), potatoes, cigar tobacco, and horticultural specialties such as greenhouse and nursery products.

The major portion of land in farms is used for producing roughages for dairy cattle, such as corn silage, hay, and pasture. The improvement of land, including drainage and stone and brush removal with power machines, and modern practices, including new plant varieties, fertilization, and mechanization, have increased the production of feed nutrients in the form of roughage which in turn replaces part of the grain imports from the Western states. These modern techniques are not only revitalizing the state's livestock industry, but vegetable, fruit, and cash crop production as well.

Fisheries.—Seafood landings for Boston, Gloucester, New Bedford, and Cape Cod during 1947 totaled more than 480 million pounds at a value of $35,715,071. These figures do not include shellfish. Boston is the chief port of entry supplying almost one third of the fresh and frozen fish consumed in the United States.

Forest Products.—Massachusetts forests produce about 135 million board feet per year, or about 10 per cent of the total consumption. Forest trees most used for commercial purposes are the

white pine for builders' finish, boxes, crates, toys, novelties, and patterns; hemlock for dimension stock and planks; red spruce for general lumber uses, such as planks and boards; red oak and white oak for timbers, shipping lumber, shipbuilding, and machine construction; hard maple for the manufacturing of furniture, heels, and turning; white birch for turning stock and furniture; ash for truck bodies, sporting goods, and machine construction; and red maple and other woods for fuel.

Mineral Production.—Practically the entire mineral production of the state is nonmetallic and includes building stones, crushed stone, lime, sand, gravel, and clay. Granite is plentiful and is found in 11 of the 14 counties but the most important quarrying centers are Quincy, Rockport, Westford, and Milford. Some marble is produced in Berkshire County.

Manufactures.—Although commerce, finance, education, recreation, and agriculture occupy important places in the state's economy, the manufacture of industrial products is its basic activity. There was little manufacturing in the state before the American Revolution. Although there was no local advantage due to the possession of raw materials, waterpower did encourage industrial development beginning in the early part of the 19th century. The climate of the southeastern part of the state was favorable to cotton spinning. Massachusetts has always been a leader in the textile industry. The first cotton mill was established at Beverly in 1788 and the first woolen mill at Byfield in 1794. The first power loom was set up in 1814 at Waltham. With the improvement in machinery and the development of waterpower, great centers such as Lowell, Lawrence, and Fall River arose in the 1830's. The development of these cities is in effect the story of the textile factory system. The boot and shoe industry is interwoven with the story of the growth of Lynn, Haverhill, Brockton, and many smaller municipalities. The first printing done in the American colonies was at Cambridge in 1639. From this small beginning the printing and publishing business has become an important industry in the state.

Following World War I much of the cotton textile industry was transferred to the South. For a time business pessimism prevailed. However, this was replaced with a spirit of aggressive management during the latter part of the 1930's and as a result a great diversification of industry has developed.

The two principal groups of industries are still (1949) textiles and shoes. Other important manufactured products are electrical machinery, foundry and machine shop products, machine tools, paper and paper products, rubber goods, textile machinery, furniture, bakery and confectionery products, chemicals, plastics, etc.

Transportation and Communications.—The state, extending midway across southern New England from east to west, occupies a strategic position in the paths of transportation and communications in the northeastern United States. Boston is the nearest large United States metropolitan center to western Europe. It is directly on the line of air traffic between the United States and Europe. Actually it is 1,200 miles nearer the Panama Canal than San Francisco and it is nearer to the ports of Argentina and Brazil than southern United States ports bordering the Gulf of Mexico.

The metropolitan area of Boston is connected with the West by two railway systems which cross the state from east to west. These lead either directly or by branches, by way of the Buffalo gateway, to all of the industrial centers of the North Central states. One system extends from Boston to the north and east, serving all of northern New England. The other general system serving Massachusetts reaches into the South by way of New York. A network of branch lines connects the factory centers of the state with each other, with the seaboard, and with the railway systems leading north, south, and west.

In 1948, the state was served by 1,746 miles of steam railway mileage. Of this 652 miles were main lines. This mileage is only about 400 miles less than the peak which was reached before the development of the state's modern system of roads and highways, which now play the usual important role in fulfilling modern transportation requirements.

With the automobile, truck, and buses the demand for good roads resulted in the construction of a vast network of all-weather, year-round, improved highways. In 1948, all of the state's 23,644 miles of roads and highways were surfaced except 1,285 miles. In 1948 the state was served by 78 airports and 18 seaplane bases. Of these, six were military airports. These serve not only local but international air traffic for both civilian and military needs. Massachusetts is well provided with telephone and telegraph service.

Economic and Financial Factors.—*Banking.*—On Dec. 31, 1948, the 258 state banks in Massachusetts had combined assets of $4,895,594,000 and deposits totaling $4,378,888,000. As of the same date there were 120 national banks with total assets of $3,095,090,000 and total deposits of $2,791,927,000.

The banks under the supervision of the state commissioner of banks include, in addition to the state commercial, mutual savings, and private banks reported on above, trust companies, cooperative savings and loan associations, and credit unions. Massachusetts ranks high in both the amount of savings deposits per capita and the number of depositors. A state law provides for a savings bank life insurance system which operates through the savings banks.

Finances.—Following is a statement of Massachusetts finance for the fiscal year 1947–1948.

Balance in treasury, beginning of fiscal year 1947–48	$ 46,167,900
Gross receipts, all sources, 1947–48	571,015,481
Total	$617,183,381
Gross disbursements, 1947–48	573,646,645
Balance, beginning of fiscal year 1948–49	$ 43,536,736

On July 1, 1948, the net direct debt of the state totaled $116,586,008.

Taxation.—The state has an income tax, and a poll tax amounting to $2 per male person over 20 years of age; there is no sales tax.

Government.—*Executive.*—The Massachusetts constitution adopted in 1780 remains the basis of government and is the oldest among state constitutions still in force. Conventions for revision of the constitution were held in 1820, 1853, and 1917–1919, upwards of 70 articles of amendment having been adopted. The executive branch of the government is headed by a governor, elected annually until 1920, and since then biennially. Other state administrative officials, elected for a

two-year term, include the lieutenant governor, members of the executive council, secretary of the commonwealth, treasurer and receiver general, auditor, and attorney general. The council, consisting of the lieutenant governor and eight councilors elected by districts, advises the governor

John Endecott	1644–1645		

The Inter-Charter Period

Joseph Dudley became president of New England under royal commission on May 17, 1686, holding the office until December 19, the same year, when Sir Edmund Andros became governor of New England, appointed by King James II. On April 18, 1689, Governor Andros was deposed by a revolution of the people. After the dissolution of the first charter, Simon Bradstreet was governor from June 7, 1689 to May 16, 1692.

Governors of the Province of Massachusetts Bay

Appointed by the king under the second charter

Sir William Phips	1692–1694	*William Tailer*	173

[1] Mr. Hinckley was governor till the union of the colonies in 1692, except during the administration of Andros.

[2] While Cradock was governor of the Company in England, John Endecott was sent out as governor of the Plantation in Massachusetts Bay, serving under Cradock and under Winthrop until the latter arrived at Salem and assumed control.

[3] Those whose names are printed in italics were acting governors.

MASSACHUSETTS: ... looks seaward while boulder-strewn moorlands make up the background. Rockport still quarries some granite, but lives on its fishing and tourist trades.

and acts as a check on his control of finance and appointments. The governor makes recommendations to the legislature, and may call special sessions; he may veto acts of the legislature, including the disallowance or reduction of items in appropriation bills, but the legislature may override the veto by a two-thirds vote of both branches. He is commander in chief of the military and naval forces of the state.

By a constitutional amendment of 1918 it was provided that all state administrative agencies, except those serving directly under the governor and council, should be organized into not more than twenty departments. Four of these are headed by elective officers: the auditor, treasurer and receiver general, the attorney general, and the secretary of state. The legislature created sixteen other departments with heads appointed by the governor and council, as follows: agriculture; banking and insurance; civil service and registration; conservation; corporations and taxation; correction; education; industrial accidents; labor and industries; mental diseases; metropolitan district commission; public health; public safety; public utilities; public welfare; and public works. As regards the recruitment of state employees, there is a division of personnel which classifies positions paid from state funds and standardizes salaries, and a civil service department which administers the examining and certifying of qualified persons. Most state employees are under civil service regulations. Administrative efficiency is aided by the commission on administration and finance. This includes a budget bureau which draws up from departmental estimates an executive budget which the governor presents to the legislature.

Legislature.—The legislature—called the General Court—consists of two houses, a Senate of 40 members and a House of Representatives of 240, both elected for a two-year term and representing in each case single member districts apportioned according to legal voters. The powers of the two chambers are similar and each chooses its own officers. The legislature meets in annual sessions, beginning on the first Wednesday in January, and there is no prescribed limit for their duration. Massachusetts was a pioneer among state legislatures in the establishment of joint standing committees, composed of members from both houses, a system adopted to save time and prevent duplication of legislative work. Measures intended to provide for direct democratic action in lawmaking were the popular initiative and the referendum, adopted in 1924. Under the former, a petition for legislation signed by 20,000 qualified voters must be voted on, pro or con, by the legislature before its adjournment, and if not passed as a law may under certain regulations be submitted to the people by ballot at the next election. Likewise the referendum permits a law passed by the legislature to be suspended and submitted to the voters at the next election. The state has been a leader in furthering interstate action among the New England states. In 1937 the General Court established a commission on interstate cooperation, which serves as a regional clearing office for the area in dealing with interstate problems.

Courts.—The Massachusetts court system is highly regarded by students of the American judiciary. At the bottom are 73 district and municipal courts, which have both civil and criminal jurisdiction. In ten cities and towns justices of the peace have jurisdiction over minor offenses. Special tribunals include courts of probate and insolvency in each county, juvenile sessions of the district courts, and a land court. The superior court, comprising a chief justice and 31 associate justices, is a court of original jurisdiction, both civil and criminal, and is the court to which most of the jury cases go. The supreme judicial court, composed of a chief justice and six associates, heads the judicial system and is almost exclusively a court of appeal. Judges throughout the state are appointed by the governor and council, with tenure during good behavior. Massachusetts has adopted various devices to shorten court procedure or prevent litigation. These include: the use in hearings of auditors and masters whose findings are prima facie evidence; arbitrators to whom, by agreement of the parties, controversies are referred; pretrial hearings in the superior court, at which judge and lawyers discuss the cases; and the rendering by the supreme judicial court of advisory opinions to the legislature, and to the governor and council. A significant feature, inaugurated by Massachusetts, is the judicial council, composed of justices and leading attorneys with authority to investigate judicial practices and to suggest reforms.

Public Health and Welfare.—Massachusetts has a vast program of legislation and many state agencies for the promotion of public welfare and social betterment. A department of public health carries on multitudinous activities, which include measures for control of communicable diseases, investigation and advice to communities concerning water supply and sewage, inspection of places which process or distribute food products, laboratories for research, testing, and production of antitoxins and vaccines, a program for cancer control, and an extensive program of child hygiene and health education. State sanatoriums are located at Lakeville, North Reading, Rutland, Westfield, and a state hospital at Pondville for cancer patients.

A department of public welfare has supervision over public relief, old age assistance, dependent and delinquent children, and private charitable corporations. Institutions under the department are the state hospital and infirmary at Tewksbury, the hospital school for crippled children at Canton, the Lyman School for boys under the age of 15 at Westborough, the industrial school for boys over 15 at Shirley, and the industrial school for girls at Lancaster.

A department of mental health has general supervision over all public and private institutions for persons with mental disorders, epileptics, and drug addicts. State hospitals for mental disorders are the Boston Psychopathic Hospital, the Metropolitan State Hospital at Waltham, and state hospitals at Boston, Bridgewater, Danvers, Foxborough, Gardner, Grafton, Medfield, Monson (for epileptics), Norfolk, Northampton, Taunton, Tewksbury, Westborough, Worcester, and the hospital cottages for children at Baldwinsville. State schools for mental defectives are located at Belchertown, Wrentham, and the Walter E. Fernald State School at Waltham.

The department of correction administers the state prison at Charlestown, a prison colony at Norfolk, the Massachusetts Reformatory at Concord, the reformatory for women at Framingham, and the state farm at Bridgewater.

Social Legislation.—Massachusetts was one of the early states to pass laws for the improvement

of industrial working conditions. The department of labor and industries acts to enforce laws and promote improvements having to do with safety and health conditions in places of employment. The department of industrial accidents administers the workmen's compensation law. A minimum wage commission established in 1912 with limited powers, was given authority in 1937 over minimum wages for women and children. In conformity with provisions for federal assistance, an unemployment compensation act was passed in 1937, providing for weekly benefit payments to the unemployed.

Suffrage and Elections.—Until 1691 the right to vote was based on church membership; the constitution of 1780 established a property qualification which was changed to tax payment in 1820, the latter being abolished in 1891. At present all persons may vote who are citizens 21 years of age, literate, have resided for one year in the state and six months in the community, and who are not excluded as persons avoidably on relief, or as being under guardianship. Party candidates for state and federal office are nominated at state primaries held in September of election years. The state was the first to adopt the so-called Massachusetts type of ballot on which the names of candidates are arranged by offices rather than by party columns.

Local Government.—As regards local government, the state allows only limited home rule to local units, and controls them through general and special laws. The county is a relatively unimportant unit of administration, principally for judicial purposes, and has no authority to tax. Much more important is the system of town government which developed in Massachusetts and extends throughout New England. It has made a notable contribution to the history of democratic government. The town is an area which includes one main and often minor centers of population, along with the surrounding countryside. Although unincorporated, the towns exercise wide powers within limits specified by state law. The principal agency of government is the town meeting, held annually or oftener. At the traditional "open" town meeting all citizens are free to take part in the discussion and to vote on town matters. There are many elected officials, chief of which are the selectmen, who act as agents in carrying out the decisions of the town meeting. Since 1916 towns with 6,000 population have been free to apply for the limited type of town meeting, to which representatives are elected; all voters may attend and speak, but only the representatives vote. A few towns operate under the town manager plan.

Until 1915 cities were chartered by special acts of the legislature, Boston being the first city incorporated (1822). In 1915 an optional charter system was introduced under which towns with 12,000 or more population may adopt one of five different plans of city government. Several cities have taken advantage of the optional charter plan, but many populous centers continue as towns. Municipal power to tax and borrow is limited and the legislature may amend charters and annul city ordinances.

In 1919 the state established the metropolitan district commission, which has authority over sewerage, parks, and water supply of many cities and towns under its jurisdiction. It carries out projects authorized by the General Court, notable among them being the Quabbin Reservoir in western Massachusetts, which supplies water t metropolitan communities. A division of metro politan planning functions under the commissio as an advisory authority.

Education.—Massachusetts was a pioneer i the development of public education in America In numerous respects precedents were establishe which were widely followed elsewhere. The prin ciple of tax-supported, state-controlled educatio began with the famous law of 1647 in the Ba Colony. This act stated that it was a principa aim of the "ould deluder, Satan, to keepe me from the knowledge of the Scriptures," and wen on to provide that every town of 50 familie should appoint someone to teach reading and writ ing, and that towns of 100 families should set u grammar schools capable of fitting youth for col lege.

The first public high school in the country which trained youth for business and industria pursuits as distinct from the old Latin gramma schools, was established at Boston in 1821. Fiv years later a high school for girls was starte there. In 1827 the General Court of Massachu setts passed the first American law requiring the establishment of high schools. It applied to towns of 500 families, but was widely evaded. In 185 Massachusetts enacted the first compulsory edu cation law in the United States, requiring the attendance of children 8 to 14 years of age fo 12 weeks a year.

In spite of these pioneering advances, educa tion in the early commonwealth was at a low ebb with widespread public apathy, wretchedly trained teachers, and poor methods. About one third o the children were without any educational oppor tunities whatsoever. Under the leadership o Horace Mann a revival began about 1837 with the establishment of a state board of education. As first secretary of the board, Mann wrote an nual reports which became classics as a discussion of school problems, and they led to improvements throughout the nation. It was due to his efforts that the first normal school in the country for the training of teachers was opened at Lexington in 1839.

The present educational system in the state operates under general laws enacted in 1920, with some later amendments. The state department of education is headed by a commissioner, who is served by an advisory board of education of six members, all appointed by the governor and council. The commissioner and board of education have coordinating and advisory function, and supervise all educational work supported by the state, but they have little direct control over local schools. The principle of local control of the schools has always been the rule, exercised in the towns and cities by elected school committees which have general charge of all public schools. Every town is required by law to maintain a sufficient number of schools for children of school age. Towns of 500 families, unless granted exception, must maintain a high school, kept open 180 days in each year, and lesser towns must pay for tuition of their children in the high school of a neighboring town. State financial aid is granted in certain cases. By law, attendance at a public school, or other school approved by the local school committee, is compulsory for children between the ages of 7 and 14, and for children between 14 and 16 unless they are granted employment certificates by the local school superintendent. under conditions which are carefully re-

stricted. A considerable number of children in the state attend parochial or other private schools.

The state grants extensive aid to vocational education. Under the supervision of the department of education are the three textile schools at Fall River, Lowell, and New Bedford, the agricultural schools of Bristol, Essex, and Norfolk counties, and the Massachusetts Maritime Academy at Hyannis. Financial aid for industrial training is given to cities and towns which maintain industrial schools, departments, and courses. In the department of education there is a division of the blind and a division of immigration and Americanization.

In the field of higher education, the state maintains the University of Massachusetts, located at Amherst. The state agricultural experiment station is located there. Apart from the university are the state teachers colleges, located at Bridgewater, Fitchburg, Framingham, Lowell, North Adams, Salem, Westfield, and Worcester, and the Massachusetts School of Art at Boston.

The state is outstanding for the number of private colleges and universities of high standing located there. Among them are the following: Harvard University (1636) at Cambridge, Williams College (1793) at Williamstown, Amherst College (1821) at Amherst, the College of the Holy Cross (1843) at Worcester, Tufts College (1852) at Medford, Boston College (1863) at Newton, Boston University (1869) at Boston, and Clark University (1887) at Worcester. Among the colleges for women only are Mount Holyoke College (1836) at South Hadley, Wellesley College (1870) at Wellesley, Smith College (1871) at Northampton, Radcliffe College (1879), affiliated with Harvard, Simmons College (1899) at Boston. Among institutions for technical training are the Massachusetts Institute of Technology (1861) at Cambridge, and Worcester Polytechnic Institute (1865).

Libraries.—Considering the number of notable libraries in the state, and the availability of library services to the public, probably no state is better served in this respect than Massachusetts. With the object of assisting library services generally, there is a division of public libraries in the department of education. There is no town in the state without its free public library. The Boston Public Library, housed in a building noteworthy for its architecture, was the first city public library supported wholly by taxation. It is one of the great scholarly libraries in the country and has set an example in making its collections freely available to the public. The libraries at Harvard University constitute one of the principal collections in the country. Other outstanding libraries include: the Boston Athenaeum, containing the books owned by George Washington; the state library, which has a collection of the laws of foreign countries and of legislative records; the Massachusetts Historical Society Library; the New England Historic Genealogical Society Library (family records); the Essex Institute Library at Salem (marine); and the American Antiquarian Society Library at Worcester, notable for its collection of bound newspapers. The Boston Museum of Natural History and the Museum of Fine Arts (specializing in Oriental collections) are outstanding in their respective fields.

History.—It is common knowledge that the first permanent settlement in Massachusetts was made in 1620 by the Pilgrims. But there had been for many years previous an active interest in the region due to its possibilities for fishing, trading with the Indians, and the acquisition of land. In 1602, Bartholomew Gosnold, an English navigator, skirted the coast of Massachusetts, gave Cape Cod its name, and settled briefly on Cuttyhunk Island. Captain John Smith explored the coast in 1614 and soon published his *Description of New England,* a glowing account of the region and its prospects. Active interest continued and, in 1620, the Council for New England was organized, with a royal charter granting title to all land between the 40th and 48th parallels. From this title came, directly or indirectly, the land grants of five colonies. Thus, regardless of the Pilgrims, settlement would have occurred soon.

The origin of the Pilgrim settlement goes back to a small group of folk in England, called Separatists because they worshipped in defiance of the established Anglican Church. They were molested by neighbors, and under their leaders, William Brewster, John Robinson (their pastor), and William Bradford, they left England, 1607–1609, and settled at Leyden in Holland. Here they lived peaceably for some years, working as laborers. But life there was hard, and fearful that their children would be assimilated by the Dutch, a part of the congregation decided to migrate to America. Permission was obtained from the Virginia Company of London (London Company) to settle in their territory, and capital to finance the undertaking was obtained from a group of London promoters. This small band left Holland for England and on Sept. 6/16, 1620, the memorable voyage began from Plymouth on the *Mayflower.* Aside from the crews, there were 102 persons on the vessel, of whom 35 were from Leyden and 67 from England, the latter not being Separatists but persons sent over by the London promoters to work.

The plan had been to settle south of the Hudson River, but, due to stress of weather, anchor was finally dropped in Provincetown Harbor, Nov. 11/21, 1620. Since this was outside the bounds of the Virginia Company, they were without charter of government or title to land. To meet this situation, the male settlers signed the "Mayflower Compact," by which they agreed to be governed by the will of the majority until more permanent provision could be made. This first American example of pure democracy was patterned after the church covenant under which all authority was vested in the assembly of church members. During the terrible first winter about half the population died, but new settlers came, including nearly all of the Leyden congregation. By 1640 there were eight towns with 2,500 population in the Plymouth Colony. The Pilgrims were simple country folk and artisans from the middle and lower classes in England, with little or no education, and without social or political distinction. In this respect they formed a contrast to their more wealthy and aristocratic neighbors of Massachusetts Bay Colony, into which they were absorbed in 1691.

During the decade after 1620 a number of small communities were established around Massachusetts Bay. In 1622 a group of businessmen of Dorchester, England, decided to establish a permanent fishing settlement in New England, to avoid the time wasted by fishermen in annual ocean crossings. In 1623 settlement was made at the present site of Gloucester on Cape Ann. The

attempt failed, but Roger Conant led a group which moved to Salem in 1626 and this became the second permanent settlement in Massachusetts. In 1628 a new company, backed by many influential Puritan gentry and merchants, obtained a grant of land from the Council for New England. Charles I in 1629 granted a royal charter incorporating this group as the Massachusetts Bay Company. From this stemmed the main settlement of Massachusetts.

This was a period of growing discontent in England. The conflict between crown and Parliament, which later led to the civil war, was growing more acute. There was a rapidly increasing number of Puritans, numerous in the towns and among the gentry, who disliked the High Church policies and repression of Archbishop William Laud. In these circumstances a group within the Massachusetts Bay Company, including John Winthrop, Thomas Dudley, and Sir Richard Saltonstall, proposed to leave England and create a Puritan refuge in America. Since the royal charter contained no clause binding the company to maintain headquarters in England —whether such a clause was omitted by accident or design is not known—it was decided to turn the charter and government of the company over to settlers who would move to New England. This move would be a protection against control of the company by groups hostile to the Puritans in England, as well as against interference by the crown. In 1630 a well-equipped fleet of vessels, carrying some 900 passengers, with Winthrop as governor, crossed the ocean and founded Boston and several towns nearby. The decade which followed witnessed a great wave of migration to America, some 15,000 going to Massachusetts and even more to the West Indies. Although the desire for religious freedom was an influential cause, this has been overstressed, and it is probable that desire for economic betterment, including land hunger, was an even more important factor.

The transfer of the company charter to America had an important bearing on the future government of the colony and its relations with England. What had been the charter of a trading corporation became the instrument for governing a colony. It was assumed in the colony that neither king nor Parliament had anything to say about the colony's affairs, and, in fact, for half a century this was almost the case. Within the colony, control was tightly vested in the hands of a narrow theocracy. Winthrop and his associates, intent on building a religious commonwealth, did not believe in democracy and felt that power must be retained in their hands. At first the General Court was composed of shareholders, called freemen, who made up less than one per cent of the inhabitants. In 1631 it was decreed that only members of an approved Puritan church might become freemen. A representative plan was soon adopted under which the freemen of each town chose deputies to the General Court. Eventually the court split into two houses.

The clergy exerted great political influence. In its early years the colony was rent by controversies and by persecution of those who challenged the prevailing orthodoxy, such as Roger Williams and Mrs. Anne Hutchinson. The Reverend Thomas Hooker left in 1636 to found Connecticut. It was not until the 18th century that more liberal views prevailed. In the years after 1688 occurred the famous witchcraft delusion, centering in Salem where 20 persons were put to death.

Constant complaints reached England of the arbitrary rule of Massachusetts authorities, of their assumption of sovereign powers, and of their failure to obey imperial laws. After the Restoration in 1660, Charles II tried to assert a greater degree of royal control. Royal commissioners sent out to investigate, met with the utmost in tactics of delay and obstruction. Finally, in 1684 Charles revoked the Massachusetts charter. This was followed by the brief experiment in colonial absolutism known as the Dominion of New England. Sir Edmund Andros was sent out as governor with autocratic powers over all of New England, as well as New York and New Jersey. This aroused the most intense opposition in Massachusetts. When news reached Boston in 1689 of the "Glorious Revolution" in England, which brought William and Mary to the throne, the Bostonians had their own revolution, clapping Andros and his advisers into jail. In 1691, Massachusetts received a new charter which brought her government more into line with that of other colonies. Henceforth, there was a governor appointed by the king, with power of veto over acts of the legislature; the charter forbade religious tests for voting; and Maine and Plymouth Colony were joined to Massachusetts.

During the 17th and early 18th centuries the settlers of Massachusetts suffered severely from Indian attacks. In 1637 the Pequot War occurred and in the years 1675–1678, the much more severe King Philip's War, in which the forces of that chieftain were crushed. The whites suffered severe losses and frontier settlement was retarded for a generation. In the subsequent wars against the French and Indians many frontier towns were ravaged. Massachusetts played a prominent role in the wars of colonial rivalry with France, 1689–1763. Under Sir William Pepperell, Massachusetts troops took the chief part in the capture of Louisburg in 1745, and they figured in various campaigns during the crucial struggle of the Seven Years' War, 1756–1763.

After the British and colonial victory over France, issues were raised which soon led to revolution in the empire. It was the British view that the colonists should pay a larger share of their cost of administration and defense. Massachusetts enjoyed prosperity from her shipbuilding industry, her trade to the West Indies, and from slave-trading expeditions to Africa. British trade regulations had been laxly enforced, and extensive smuggling had developed. British measures after 1761 to eliminate smuggling and increase colonial revenue met opposition from the mercantile classes of Massachusetts, and from leaders such as James Otis, Samuel Adams, John Adams, and John Hancock. The Massachusetts House in 1765 took the lead in calling an intercolonial Congress to resist the Stamp Act. Samuel Adams, a radical agitator of Boston who led the movement for nonimportation agreements and "committees of correspondence," did much to develop an irreconcilable revolutionary spirit. Royal troops were stationed in Boston and friction with the citizens culminated in the Boston massacre, March 5, 1770, in which soldiers, goaded by a mob, fired, killing five persons. When Parliament persisted with a tax on tea, Samuel Adams took the lead in organizing the "Boston tea party," 1773. Citizens disguised as Indians boarded the vessels in Boston Harbor and dumped the chests of tea into the water. In retaliation Parliament passed the

Boston Port Bill, closing the port to commerce. When Governor Gage dissolved the General Court in 1774, the members resolved themselves into a provincial congress and adopted plans for mustering the militia, including the minutemen. The first blood of the revolution was shed at Lexington on April 19, 1775, when General Gage sent troops to Concord to destroy military stores collected there by the colonists. At the Battle of Bunker Hill, June 17, 1775, the British suffered over 1,000 casualties in taking a hill from militia who were besieging them in Boston. For the remainder of the war, no important engagement was fought in Massachusetts.

In September 1779 a convention, authorized by the people, framed a state constitution which was ratified in June 1780.

A few years later came the episode known as Shays' Rebellion, 1786–1787. Business depression and rigorous foreclosures for debts and taxes caused an uprising of the farmers led by a former army captain, Daniel Shays. Although suppressed by the militia, it alarmed the conservative classes and played its part in the movement for a new federal Constitution. The state ratified the federal Constitution Feb. 6, 1788, after a sharp contest and after the Federalists drafted amendments which met the demand for a bill of rights. Dominated by the commercial classes, who were Federalists, the state became bitterly opposed to the principles of Jeffersonian democracy. There was much opposition to the War of 1812 and the greatest lack of support. Massachusetts took the lead in summoning the abortive Hartford Convention of 1814.

The mid-19th century was the glorious age of Massachusetts, a period in which it had both economic and cultural pre-eminence. A new liberalism had developed, Unitarianism in religion and transcendentalism in literature. The state produced a galaxy of literary figures: Emerson, Hawthorne, Holmes, Longfellow, Lowell, Bryant, Thoreau, Prescott, Parkman, and others. Support for social reforms and experimentation developed. In the slavery issue Massachusetts became a center of the abolitionist movement and later gave unstinted support to the Union cause in the Civil War.

As the factory system developed after 1830, Massachusetts gained a leading position in many fields, particularly in cotton and woolen textiles, and in the boot and shoe industry. After 1850, society was transformed by immigration, first of Irish, later of French Canadians and people of southern and eastern European stock.

Throughout its history under the constitution, the state was dominantly Federalist, Whig, and Republican in politics, but the Democratic party came to control many of the industrial centers.

chusetts Historical Society, *Proceedings and Collections* (Boston); many excellent articles in *The New England Quarterly* (Brunswick, Me.).

THEODORE C. CALDWELL,
Professor of History, University of Massachusetts.
GEORGE W. WESTCOTT,
Economist, University of Massachusetts.

MASSACHUSETTS, University of, is located in Amherst, near the geographical center of the state, and overlooking one of the picturesque sections of the Connecticut River valley. The campus consists of 700 acres. In addition, the University owns a forest demonstration area of 750 acres on a mountain ten miles from the campus.

The university is the state institution of the commonwealth and was founded under the provisions of the Morrill Land Grant Act of Congress of 1862. Massachusetts accepted the provisions of the Morrill Act in 1863 by founding the college at Amherst to be known as "Massachusetts Agricultural College." The trustees of the college were incorporated in 1863 and officers were appointed in that year. It was not until Oct. 2, 1867, that the college was formally opened to students. In April 1931, the name of the institution was changed by legislative enactment to Massachusetts State College, and in May 1947 the college became the University of Massachusetts.

The university consists of three main parts: an undergraduate college, a graduate school, and the Stockbridge School of Agriculture. The Stockbridge School provides a two-year vocational course.

The graduate school consists of a college of arts and sciences and schools of business administration, engineering, agriculture, horticulture, and home economics.

Since 1946 the legislature has approved a ten million dollar building program at the university.

In 1946 a branch of the university was established at Fort Devens to provide instruction of collegiate grade to Massachusetts veterans. This branch was discontinued in June 1949.

MASSACHUSETTS BALLOT. See BALLOT.

MASSACHUSETTS BAY, an arm of the Atlantic indenting the eastern shore of Massachusetts and extending from Plymouth Harbor on the south to Cape Ann on the north, a distance of 42 miles. It is triangular in shape, the north and south shores inclining toward each other until at the entrance to Boston Harbor they are about five miles apart. The depth from the base of the triangle to Boston Harbor is about 21 miles. The northern shore is rocky and irregular, the southern low and sandy. The principal inlets are: on the north coast, Gloucester and Nahant bays and Salem, Marblehead and Lynn harbors, and on the west Boston Harbor. Along the shores are a number of capes and headlands, and off the coast a number of small islands. At the entrance to Boston Harbor there are several islands, on some of which are fortifications. Cape Cod Bay on the southeast is sometimes included in Massachusetts Bay.

MASSACHUSETTS BAY COMPANY. A royal charter of 1629 confirmed to a group of merchants and others, calling themselves the Massachusetts Bay Company, a grant made to them the year before by the Council of New England which authorized them to trade and colonize in New England between the Merrimack and Charles rivers. The Council's patent of 1628 had accorded the company powers of local self-government which, however, were to be subject to the general government that the Council itself intended to establish over all New England. This dependence on the Council was nullified by the royal charter which permitted the company to establish for its colony whatever form of government it chose, subject only to the king.

At its organization in England, the company closely resembled other European trading companies with charters from their home government authorizing settlements on the American continent. Thus its royal charter provided for the usual government organs for such settlements: a governor, assistants, and a general court of stockholders. But in this instance, the usual clause requiring the company to hold its business meetings in England was omitted. Consequently when in 1630 the leading stockholders, Puritans to a man, despairing of political and religious reforms in England, migrated to Massachusetts with their families, goods and chattels, they could take their charter with them and use it as their basic constitution for the colony's government. Through the control exercised by the general court on admission of new members to the company they were able to limit the suffrage to members of their own faith. Thus, almost at the outset the colony, chartered as a commercial enterprise, was converted into a Calvinist theocracy, virtually independent of external control. As new towns were founded in Massachusetts representative government developed, and the general court consisted of deputies from these towns.

Although the Massachusetts Bay Company remained neutral during the Puritan Revolution in England, it joined with Plymouth, Connecticut and New Haven in a defensive league in 1643. A commission, sent from England to investigate the company in 1664 at the time of the conquest of New Netherland, reported that Massachusetts had committed grave errors in coining money without authority, denying freedom of worship to dissenters, refusing to obey the Navigation Acts, etc. Edward Randolph's report of 1676 was still more critical. Its charter was withdrawn in 1684, but the government continued to function until establishment of the Dominion of New England in 1686.

MASSACHUSETTS HISTORICAL SOCIETY, the oldest of its kind in the United States, was founded by Jeremy Belknap (1744–1798), and held its first meeting in Boston on Jan. 24, 1791. Resident members must be citizens of Massachusetts and may not exceed a total of 125, but 50 corresponding members are elected from other states of the Union, and 10 honorary members from Europe and South America. The society meets on the second Thursday of every month from October to May inclusive. Its chief publications consist of its *Proceedings, Collections, The Winthrop Papers,* and *The Lives of Harvard Graduates.* No dues are collected from members; the expenses of the society and publications being met by the income of its endowment, amounting to one million dollars.

The society possesses a library of 250,000 books and pamphlets, many of which are extremely rare. The chief glory of its library is its large and in

valuable collection of manuscripts, certainly the greatest in New England and probably one of the finest in the United States. The library of the society is open to accredited scholars five days a week. The museum of the society, containing many remarkable portraits and unique objects connected with American history, is open to the public.

MASSACHUSETTS INSTITUTE OF TECHNOLOGY. As stated in its charter, granted by the commonwealth on April 10, 1861, the Massachusetts Institute of Technology was established "for the purpose of instituting and maintaining a society of arts, a museum of arts, and a school of industrial science and aiding generally by suitable means the advancement, development, and practical applications of science in connection with arts, agriculture, manufactures and commerce."

Motivated by the pioneering spirit of its founder, William Barton Rogers (1804–1882), the institute proceeded rapidly to make many seminal contributions to education and industry. It pioneered in extending the laboratory methods of instruction as an indispensable educational technique. It virtually created the modern profession of chemical engineering; its courses in electrical engineering, in aeronautical engineering, and in applied physics were probably the first in the world. It was the first technological institution to recognize and provide for the important place of economics in the training of the engineer.

In attaining its present position, the institute has constantly kept before it three objectives—the education of men, the advancement of knowledge, and the rendering of service to industry and the nation. It aims to give its students such a combination of humanistic, scientific, and professional training as will fit them to take leading positions in a world in which science, engineering, and architecture are of basic importance. This training is especially planned to prepare students, according to their desires and aptitudes, to become practicing engineers or architects, investigators, business executives, or teachers. The useful knowledge and mental discipline gained in this training are, however, so broad and fundamental as to constitute an excellent general preparation for other careers.

To vitalize its educational procedure and to fulfill its objectives, the institute emphasizes original research in pure and applied science. Experience has demonstrated that teaching of the highest type, especially in science and its applications, thrives best in an atmosphere of steady progress in the understanding of the subject taught.

At the present time (1949), the Massachusetts Institute of Technology carries on its teaching and research on its Cambridge site of 100 acres on which are located a complex of academic, residential, and recreational buildings and facilities. It maintains educational and research activities in 47 different locations, in 11 states and Canada, including the Brookhaven National Laboratories on Long Island and the Atomic Energy Laboratory at Oak Ridge, Tennessee.

The growth of the student body may be gleaned from the abbreviated summary:

Year	Total students	Year	Total students
1865–66	72	1915–16	1,900
1875–76	255	1925–26	2,813
1885–86	609	1935–36	2,540
1895–96	1,187	1945–46	1,538
1905–06	1,466	1948–49	5,433

During World War II, the institute trained many thousands of persons for the armed forces. In the postwar period, its enrollment reached 5,600 in 1947–1948, but it dropped to 5,400 in 1948–1949 and the institute is planning a postwar stabilized enrollment of 4,500.

Graduate work at the institute has always been a significant factor. Provisions for offering graduate courses of instruction date back to 1872. Of a total of 31,412 degrees awarded (1868–1949), 23,264, or 74.1 per cent, were bachelor degrees; 6,819, or 21.7 per cent, were engineering; and 1,291, or 4.1 per cent, were doctor's degrees.

MASSACHUSETTS MEDICAL SOCIETY, an association incorporated at Boston, Mass., Nov. 1, 1781, and holding regular sessions from that date to the present. Its charter was signed by John Hancock, first state governor of Massachusetts. Physicians and surgeons, who have made their medical studies in colleges approved by the society and who have been examined by its censors and are of known probity, are eligible to membership. Women were first admitted in 1884. Since 1790 it has regularly issued its *Medical Communications.* It also issues a *Pharmacopoeia* and *Publications,* various reports and essays, an annual directory, and, since 1789, a triennial catalogue.

MASSACRE (French, *massacre,* slaughter, probably connected with Latin, *macellum,* a meat-market), the indiscriminate and unnecessary slaughter of human beings, and, in a transferred sense, of animals. In the case of human beings it implies the absence of all forms of law or of sufficient grounds.

MASSACRE OF THE INNOCENTS, the slaughter of the children in and about Bethlehem by the soldiers of Herod, whose superstitious fears caused him to see a rival in the babe of whose birth he was apprised by the wise men (Matthew II, 1–16). The story has been for centuries a favorite subject with artists, especially those of the Flemish and Italian schools.

Among the greatest examples are those by Tintoretto, Reni and Rubens.

MASSAGE, a procedure, usually performed by the hands, such as friction, kneading, rolling and percussion of the external tissues of the body, either to relieve pain or to assist a cure, or with some hygienic object in view. A male massagist is known as a masseur, a female as a masseuse. Massage in some crude form has always been used by savages as well as by the civilized. It was mentioned by Homer and Hippocrates, having been one of the luxuries of the ancient Greeks, and, among the Romans, was largely used by gladiators, and to make slaves more comely by filling out their tissues. Sometimes it was done by medical practitioners, often by slaves and priests and those appointed to anoint the wrestlers before and after they exercised.

Often the use of massage is associated with that of certain active and passive movements known as the Swedish movement-cure (q.v.), established by Pehr Henrik Ling. His system of gymnastics became popular in spite of opposition and of the fact that it was largely a revival of old methods of treat-

ment. In 1873 Mezger, of Amsterdam, and in 1877 S. Weir Mitchell of Philadelphia pushed forward the cause of massage. To-day it is considered by physicians as a branch of medical treatment, useful in certain cases if rightly administered, but capable of doing harm when improperly applied. Unfortunately the laity frequently look upon it as a sole means of relief or cure. Much depends upon the judgment and skill of the masseur, as the special reaction of the individual patient has to be considered and, on the other hand, a skilful operator can accomplish more in a quarter of an hour than an ignorant one can in an hour. The procedures in massage may be placed under four heads: stroking (the *effleurage* of the French), kneading (malaxation), friction and percussion. Stroking is performed over surfaces with the palm of the hand or its radial border, or with the pulps of the fingers, or the sides of the knuckles. Kneading is the grasping of muscles, etc., with both hands or between the thumb and fingers of one hand, and rolling and squeezing them. Friction is a peculiar and forcible circular rubbing. Percussion is the striking or beating of a part, either with the hand or an instrument called a percussor or muscle-beater. A special technique of massaging the face, and particularly the ears and eyes, has had surprisingly gratifying results in preventing deafness and curing certain types of blindness, for instance, where an embolism of a central artery of the retina has been removed by massage. It is claimed that the modern system of massage makes the blood circulate more freely, strengthens muscle-fibres, causes effusions and exudations to be absorbed, improves secretory and excretory action, and invigorates the whole system. It is frequently used with good results to stimulate assimilation and invigorate digestion, to soothe nervous irritability, relieve pain and arouse nerve-force, to equalize the circulation, to remove morbid deposits from around joints, to restore mobility, and for the correction of obstinate constipation and other disordered conditions.

From the point of view of the modern study of unconscious mentality it will be seen that those persons who are the greatest advocates of massage will be the ones who are unconsciously satisfying a desire for stroking, kneading, friction and percussion. Such a method of curing their ills will make an immediate and a strong appeal to their instincts. This presupposes a physical and mental make up, predisposed by early development, to seek and get satisfactions from the skin and muscle sensations derived from manipulation at the hands of another. This mental disposition is in modern times well recognized in psychoanalysis (q.v.), which, however, goes at the treatment in another way. For any diseases which may be helped by massage, there is a cause in the way in which the mind unconsciously regards the pleasures derived from the manipulation of the skin and muscles. If, for instance, the individual is of such a mental constitution that, because of early environment, he has been led to derive more than ordinary pleasure from being stroked, kneaded, rubbed or even beaten (and the history of the development of massage shows that such persons are quite numerous); such an individual will be the more likely to contract diseases of the type which are on record as having been remedied or cured by massage. He will develop those diseases instinctively without knowing the connection between them and the unconscious wish which is the cause of the specific incidence of the symptoms. This practically amounts to saying that the diseases which are enumerated as having been cured by massage are diseases which are virtually selected by the unconscious because of the fact that their treatment will involve the gratification of wishes for just such specific stimulation of the muscular, tendonous and cutaneous end organs. The patient will do well under such a treatment, at least, partly because a source of unconscious gratification closed to him possibly since early childhood has been through massage reopened to him.

MASSAGETÆ, mą-săj'ĕ-tē, in ancient history, a name given to nomadic tribes of northern Asia who dwelt to the east and south of the Caspian Sea. Herodotus says they worshiped and offered horses to the sun, had a community of wives, killed and ate their aged people, lived chiefly on the milk and flesh of their herds and on fish, and fought on foot and on horseback with lance, bow and double-edged axe. They are chiefly mentioned in connection with Persian history. Cyrus the Great perished in war with the Massagetæ, 529 B.C. According to some they belonged to the Mongolian stock, according to others to the Aryan.

MASSASOIT, măs'ą-soit, American Indian chief, sachem of the Wampanoags: b. Massachusetts, 1580; d. 1661. His dominion extended over nearly all the southern part of Massachusetts, from Cape Cod to Narragansett Bay; but his tribe, once estimated at 30,000 in number, had shortly before the landing of the Pilgrims at Plymouth been reduced by a disease, supposed to have been yellow fever, to barely 300. On 22 March 1621, a little more than three months after the founding of Plymouth, he appeared before the infant settlement with 60 of his warriors, armed and painted, for the purpose of forming a friendly league with the white men. Although the tribe were reputed to be cruel and treacherous, the open and friendly greeting of Massasoit so favorably impressed Governor Carver, that after the necessary formalities were concluded, he formed in behalf of the colony a treaty of peace and mutual protection with the Wampanoags, which for 50 years was sacredly kept by both parties. The friendly disposition of Massasoit toward the colonists never relaxed. He lived within the limits of what is now the town of Warren, R. I., near an abundant spring which yet bears his name, where he often entertained wandering pilgrims or administered to their necessities. Roger Williams, while on his way to Providence, was for several weeks his guest at this place. Massasoit was just, humane and honest, never violating his word and constantly endeavoring to imbue his people with a love of peace. In person, Morton says, in his 'Memorial,' he was "a portly man in his best years, grave of countenance, spare of speech." His second son, Pometacom, called by the colonists King Philip, who ultimately became sachem of the Wampanoags, was of a less placable disposition, and allowed the encroachments of the colonists to hurry him into the bloody contest known as King Philip's War.

Consult Baker, Virginia, *Massasoits' Town Sowams in Pokanoket* (Warren, R. I., 1904).

MASSASSAUGA, măs-ă-sô'gă, the ground rattlesnake of the central United States. See RATTLESNAKE.

MASSAWA, mă-sä'wă (Italian MASSAUA), seaport, Eritrea; on the Red Sea. It is situated on the Bay of Massawa in the hot, arid coastal plain, and has a fine harbor sheltered by the Dahlak Archipelago. The latter is noted for its pearl and mother-of-pearl fisheries. Massawa is 40 miles northeast of Asmara, with which it is connected by road and narrow-gauge railroad. The port is built on two islands—Massawa, with the old Arab town, and Taulud, more modern—and the adjacent mainland. Railroads and highways built on dikes interconnect these sections. The port was heavily damaged by an earthquake in 1921 and was largely rebuilt of stone from the Dahlak Archipelago. Besides pearls, and mother-of-pearl, Massawa exports salt, hides, coffee, fish, oilseeds, and gum arabic. There are shipyards, extensive harbor installations, and manufactures of iron, cement, brick, and tobacco.

Massawa was taken by the Turks in 1557, but the negus of Ethiopia was also later influential in its affairs. In the 18th and 19th centuries it was held by the sherif of Mecca, by Egypt, again by the Turks, and in 1865 was ceded by the latter to Egypt. The Italians established themselves here, Feb. 6, 1885, and began their expansion inland, which resulted in the Italian colony of Eritrea (1890), of which Massawa was the capital until 1897. During World War II, the port was captured by the British, April 7, 1941. The Italians, however, had destroyed the harbor installations and sunk ships in the harbor, and much clearing was necessary. Massawa nevertheless became an important Allied base. Pop. (1947 est.) 25,000.

MASSENA, mă-sä-nä, **André,** French marshal under Napoleon: b. Leven, near Nice, France, May 6, 1758; d. Paris, April 4, 1817. At the age of 17 he entered the French army and, after serving 14 years, settled in Nice where he married. After the outbreak of the revolution he entered a battalion of volunteers and in 1793 was made a general of brigade. Taking command of the right wing of the French army in Italy in 1794, Masséna distinguished himself highly at Rivoli and elsewhere. In 1799 he defeated the Austrian and Russian forces at Zürich and in 1800 his three-month defense of Genoa gave Napoleon Bonaparte time to strike successfully at Marengo.

Created marshal of the empire in 1804, Masséna received in the following year the chief command in Italy, where, after the peace of Pressburg, he occupied the kingdom of Naples. In 1807 he was given command of the right wing of the French army in Poland and soon after received the title of duc de Rivoli. At Esslingen in 1809 his constancy and firmness saved the French army from total destruction and Napoleon rewarded him with the further dignity of prince d'Essling.

In command of the army in Portugal in 1810, Masséna forced Wellington within the lines of Torres Vedras, till want of provisions compelled him to retire. Louis XVIII made him a peer in 1814 and though on the return of the emperor he acknowledged his authority, he took no active part in the events of the Hundred Days.

MASSENA, mă-sē'nä, village, New York, in St. Lawrence County, 33 miles northeast of Ogdensburg on the Raquette and Grass rivers, state and federal highways, and the New York Central, the Grand Trunk, and the Massena Terminal railroads. Altitude 207 feet. It is situated in a rich farming and dairying region, in which the chief crops are potatoes, hay, and apples. The county ships great quantities of milk and cream to large cities such as New York.

In 1900 a company was organized to construct a canal leading water from the St. Lawrence into the Grass River, to be carried by that stream back to the St. Lawrence. The canal, dropping 45 feet in a distance of 3 miles, produces a cheap source of power which has contributed to the development of the village. Power from this canal is used by the Aluminum Company of America, which manufactures aluminum cable for the transmission of electric current, and aluminum structural shapes. The warehouses, mills, and shops of this plant cover an area of 50 acres. Other manufactures include wood products, silk, and women's foundation wear.

Massena came into being as a log cabin settlement in 1792, when Anable Fancher put up a sawmill beside the Grass River and named the place after Marshal André Masséna. Ten years later a party of settlers moved in from Vermont. Massena was incorporated as a village in 1886. In 1927 part of Massena town was annexed to Massena village. The town as originally constituted included the villages of Massena Center and Massena Springs, the latter having been at one time a popular resort because of its mineral waters. Points of interest near by are some old Indian burial mounds and the Long Sault Rapids of the St. Lawrence River. Massena has a mayor-council form of government. Pop. (1950) 13,137.

MASSENET, mäs-nĕ', **Jules Émile Frédéric,** French composer: b. Montaud, France, May 12, 1842; d. Paris, Aug. 13, 1912. He was the son of a blacksmith who had served in the engineers under Napoleon, and was the youngest of 21 children. After studying at the Paris Conservatoire under Adolphe Laurent, Augustin Savard, Napoléon-Henri Reber, and Ambroise Thomas, he gained the first prize for pianoforte in 1859 and four years later the Prix de Rome for his cantata *David Rizzio.* He travelled in Italy and Germany and upon his return to Paris, he had his first opera, *La Grand-Tante,* performed at the Opéra Comique in 1867. He was appointed professor of composition at the conservatoire in 1878 and in the same year was elected to the Académie des Beaux Arts.

Among his earlier works are the song cycles, *Poème du Souvenir* and *Poème d'Avril* (1860); his first important opera, *Don Cesar de Bazan* (1872); followed in the same year by his incidental music to *Les Érinnyes* (a tragedy by Leconte de Lisle), from which his famous *Élégie* was taken, and the sacred drama *Marie Magdeleine* (produced in 1873). An oratorio, *Ève,* was performed in 1875; the opera *Le Roi de Lahore* in 1877; and a sacred legend *La Vierge* in 1879.

One of his most popular operas was *Herodiade,* which was first performed in Brussels in 1881. The work through which he is probably best

known, however, is his opera *Manon*, in which he replaced the usual *recitativo secco* with dialogue over an orchestral accompaniment and adopted the *leitmotiv* device in the manner of Gounod. Based on a libretto by Henri Meilhac and Philippe Gille, *Manon* was first performed at the Opera Comique in 1884 and since then has maintained a steady position in opera repertory. Other dramatic works include *Le Cid* (1885); *Esclarmonde* (1889); *Le Mage* (1891); *Werther,* based on Goethe's story (1892); *Thais,* adopted from the novel by Anatole France (1894); *Le Portrait de Manon,* a short one-act piece (1895); and *Le Jongleur de Notre Dame* (1902). His last important operas were *Don Quichotte,* produced at Monte Carlo in 1910, the title role created by Feodor Chaliapin, and the comedy *Panurge,* which he completed just before his death. He also wrote a large number of popular melodies, pianoforte pieces, orchestral suites, cantatas, and incidental music.

MASSEY, măs'ĭ, Gerald, English poet: b. Gamble Wharf, near Tring, Hertfordshire, May 29, 1828; d. Redcot, South Norwood, Surrey, Oct. 29, 1907. He received but little education, and at eight was employed in a silk factory. Going to London about 1843, he became an errand boy, and in 1849 editor of *The Spirit of Freedom,* a Radical paper, becoming at the same time associated with Kingsley, Maurice and other Christian Socialists. In 1854 he published *Ballad of Babe Christabel* and other poems. The volume attracted the notice of Landor, and the poems issued in succession to it met with no little popularity.

MASSEY, Hart Almerin, Canadian manufacturer and philanthropist: b. Haldimand, Northumberland County, Ontario, April 29, 1823; d. Toronto, Feb. 20, 1896. Educated at Victoria College, Cobourg, Ontario, he assisted in managing his father's farms and while thus engaged set about improving the agricultural implements then in use. His father established a factory at Newcastle of which Hart became sole owner in 1855. He perfected mowing and reaping machines, first of their kind in Canada, and introduced improvements in other farm implements.

MASSEY, Raymond, Canadian actor and producer: b. Toronto, Ont., Aug. 30, 1896. Educated at the University of Toronto and at Oxford he served in the Canadian Field Artillery during World War I and was an instructor in field artillery at Yale and Princeton universities in 1917 and in Siberia in 1918. He made his stage debut in 1922 at Everyman Theatre and entered in the management of this theater in 1926. Here he produced a number of plays and played a variety of parts. His most conspicuous success was as Abraham Lincoln in *Abe Lincoln in Illinois* at the Plymouth Theatre, New York, in 1938–1939. He served in World War II with the rank of major and became an American citizen in 1944.

MASSEY, Vincent, Canadian government official: b. Toronto, Ont., Feb. 20, 1887. The grandson of Hart Almerin Massey, he graduated from the University of Toronto (1910) and Balliol College, Oxford (1918), subsequently entering upon a public career and the presidency of his grandfather's farm equipment firm, the 5th largest in the world.

Massey resigned his business affiliation in 1925 to become a minister in the Liberal cabinet of Prime Minister Mackenzie King, and in 1926 was appointed first Canadian minister to the United States, where he remained until 1930. From 1935 to 1946 he served as high commissioner for Canada in the United Kingdom; was appointed chancellor of the University of Toronto in 1947; and in 1949 became chairman of the Royal Commission on National Development in the Arts, Letters, and Sciences, in whose report an independent Canadian culture was found seriously hampered by that of the United States. In 1952 he succeeded Field Marshal Viscount Alexander to the post of Canadian governor general.

MASSICOT, măs'ĭ-kŏt, a mineral consisting of monoxide of lead, PbO, containing about 92.8 per cent of that metal, which occurs in many deposits in Colorado, Idaho, Nevada, and Virginia.

MASSILLON, mà-sē-yôN', **Jean Baptiste,** French ecclesiastic: b. Hyères, Provence, June 24, 1663; d. Clermont, Sept. 18, 1742. In 1681 he entered the Congregation of the Oratory, then taught at Montbrison, and in 1692 was ordained priest at Vienne. He went to Paris 4 years later as director of the Seminary of Saint Magliore, and won great favor, even at court, by his eloquent sermons. His funeral orations are particularly famous. He was made bishop of Clermont in 1717 and in the following year delivered 10 sermons before the 9-year-old Louis XV, which were later published as *Petite Carême.*

Massillon was elected to the French Academy in 1719 and in the same year he retired from Paris to Clermont, where he died of apoplexy. His works were edited in 1828 by Marie Nicolas Guillon and in 1886 by the Abbé Blampiguan, whose biographical sketch, *Massillon d'après des Documents inédits* (Paris 1879) should be consulted.

MASSILLON, city, Ohio, in Stark County, 8 miles northwest of Canton on the Tuscarawas River, state and federal highways, and the Pennsylvania, the Baltimore and Ohio, and the Wheeling and Lake Erie railroads. Altitude 1,030 feet. Situated in a region of farm lands and coal deposits, it manufactures special steels, automobile accessories, equipment for the conveyance of heat, furnaces, refractories, and fabricated metal products. The city has a public library, a modern general hospital, and a state hospital for the insane. The Baldwin Museum, housed in an old town home, has exhibits in science, history, and art. One of the landmarks in the city is the Jacob S. Coxey house, home of the leader of "Coxey's army."

Settled in 1812, Massillon was first chartered in 1826 when the Ohio and Erie Canal was projected. With opening of the canal between Cleveland and Massillon, the city took its place as a leading grain market, and when canals began to give way to the railroads in the 1850's, it was firmly established as a trading center.

Massillon was named for Father Jean Baptiste Massillon by Mrs. James Duncan, the wife of the founder. It has a mayor-council form of government. Pop. (1950) 29,594.

MASSINGER, măs'-ĭn-jĕr, **Philip,** English dramatist: b. Salisbury, November 1583; d. Southwark, London, March 1640. He studied at

Saint Alban Hall, Oxford, from 1602 to 1606, after which time he left without taking a degree and moved to London where he soon became a well-known playwright. He collaborated with Nathaniel Field, Thomas Dekker, Cyril Tourneur, and Robert Daborne, and regularly with John Fletcher from 1613 until the latter's death in 1625.

Independently, Massinger wrote 15 plays. They are frequently based closely on Italian and Spanish originals, but show much skilfulness in the development of plot, and a knowledge of the requirements imposed by stage presentation. *Henry VIII* in its present form was probably written by him and Fletcher. That he became a Roman Catholic has been suggested, but not proved, on the evidence of certain plays written in collaboration with Dekker. Among the plays wholly by him are *The Bondman* (1624); *The Roman Actor* (1629); *A New Way to Pay Old Debts* (1632); and *The Guardian* (1655). By far the most popular of his works was *A New Way to Pay Old Debts* (q.v.) which kept the stage in England to the end of the 19th century.

Bibliography.—The standard edition of Massinger's plays is by William Gifford, *The Plays of Philip Massinger* (London 1805). Other collections are Hartley Coleridge, *Dramatic Works of Massinger and Ford*, rev. ed. (London 1883) and Arthur Symons, *Selected Plays of Philip Massinger* (London 1887–89). Biographical and critical material will be found in the following works: Koeppel, Emil, *Quellen Studien zu den Dramen Chapmans, Massingers und Fords* (Strassburg 1897); Cruickshank, Alfred Hamilton, *Philip Massinger* (Oxford 1920); Maxwell, Baldwin, *Studies in Beaumont and Fletcher and Massinger* (Chapel Hill, N. C. 1939).

MASSON, măs″n, **David,** Scottish critic: b. Aberdeen, Dec. 2, 1822; d. Edinburgh, Oct. 7, 1907. He was educated at Marischal College and Edinburgh University, and in 1847 moved to London, where he contributed to many magazines and became acquainted with the literary figures of the time. In 1853 he succeeded Arthur Clough in the chair of English literature at University College, London. He was the first editor (1859–1868) of *Macmillan's Magazine,* and was professor of rhetoric and English literature at the University of Edinburgh, 1865–1895. In 1892 he was appointed historiographer royal for Scotland.

Masson's great work is his elaborate and comprehensive *Life of Milton, Narrated in Connection with the Political, Ecclesiastical, and Literary History of His Time* (6 vols., 1859–1880). Other works include *British Novelists and Their Styles* (1859); *Recent British Philosophies* (1865); *Drummond of Hawthornden* (1873); *Three Devils: Luther's, Milton's, and Goethe's* (1874); *De Quincey,* in the English Men of Letters series (1878); *Carlyle Personally and in His Writings* (1885); and *Edinburgh Sketches and Memories* (1892). He also edited *The Poetical Works of John Milton* (1874; reissued many times) and *The Collected Writings of Thomas De Quincey* (14 vols., 1889–1900).

MASSON, mă-sôN, **Frédéric,** French historian: b. Paris, March 8, 1847; d. there, Feb. 9, 1923. He was librarian in the archives of the Foreign Office, 1868–1880, and after the overthrow of the Second Empire became secretary to Prince Napoleon, and was entrusted with the arrangement of the prince's papers and collections. Masson is noted for his works on Napoleonic history. His method was anecdotal, and he based his works on original documents, many of which were in his private collection, which he bequeathed to the Institute of France. In 1903 he was elected to the Académie Française and in 1919 became its perpetual secretary.

His chief work was *Napoléon et sa famille* (13 vols., 1897–1919). Other studies include *La révolte de Toulon en prairial* (1875); *Le Marquis de Grignan* (1881); *Les diplomates de la Révolution* (1883); *Napoléon et les femmes* (1893); *Napoléon chez lui* (1894); *Les cavaliers de Napoléon* (1895); *Napoléon inconnu* (1895); *Marie Valewska* (1898); *Joséphine impératrice et reine* (1898); *Joséphine de Beauharnais* (1899); *Joséphine repudiée* (1901); *L'Impératrice Marie-Louise* (1901); *Napoléon et son fils* (1904); *Napoléon à Sainte-Hélène* (1912); *Pour l'Empereur* (1913–1917); and *Madame Bonaparte* (1920).

MASSON, Louis François Rodrigue, Canadian statesman: b. Terrebonne, Lower Canada (now in Quebec), Nov. 7, 1833; d. Montreal, Nov. 8, 1903. He was educated at Georgetown College in the United States and at the College of St. Hyacinthe in Canada, and in 1859 was called to the bar of Lower Canada. Masson was elected to the Canadian House of Commons as a Conservative member from Terrebonne in 1867 and held his seat until 1882. He served as minister of militia in 1878–1880; became president of the council in the latter year; and in 1884–1887 served as lieutenant governor of Quebec. He was called to the Senate of Canada in 1882 and a second time in 1892.

MASSON, măs″n, **Tom** (in full Thomas Lansing Masson), American humorist and editor: b. Essex, Conn., July 21, 1866; d. Glen Ridge, N. J., June 18, 1934. He was educated in the public schools of New Haven, Conn., and from 1893 to 1922 was literary and managing editor of *Life* magazine; associate editor of *The Saturday Evening Post* 1922–1930. Besides several anthologies of humor, his published works include *The Yankee Navy* (1899), *A Corner in Women* (1905), *The Von Blumers* (1906), *Well, Why Not?* (1921), *Listen to These* (1922), *That Silver Lining* (1923); and in a more serious vein, *The New Plato* (1905), *Why I am a Spiritual Vagabond* (1925), and *In Tune with the Finite* (1928).

MASSYS. See Matsys, Quentin.

MASTER BUILDER, The. The tendency toward symbolism to be observed in the early romantic works of Henrik Ibsen, and occasionally in his dramas of social awakening, becomes dominant in *The Master Builder* (*Bygmester Solness*), published in 1892 and played the next season. In *The Wild Duck* and *The Lady from the Sea,* Ibsen had already mingled symbolism with naturalism; but only in *The Master Builder* does the hidden allegory threaten to warp his surface story out of consistency. The piece, which begins with matter-of-fact scenes and situations from middle-class life, ere long develops into a tenuous fable that suggests much more than it presents.

As a drama of ideas *The Master Builder* emphasizes two notions: the peril of selfish individualism, already shown in *Rosmersholm* and *Hedda Gabler;* and the struggle of age against youth. Ibsen, conscious of his advancing years, felt the inevitable passing of power from the

older to the younger generation. He felt, also, not only the fear of youth, but its fascination, especially in his innocent affair with Emilie Bardach, a girl of 18 whom he, at the age of 61, had met in the Tirol during the summer of 1889, and with whom he later corresponded. He has universalized these merely personal sentiments, setting forth the problem of every man who lives long enough to regret what is gone and to strive desperately to hold what is slipping from him. This particular conflict Ibsen associates with the still larger conflict between individualism and altruism.

Solness, the master builder, has achieved success at the expense of his wife and his business associates. He has checked the rise of old Knut Brovik, and refused to young Ragnar Brovik permission to build independently. He has employed the latter's sweetheart and captured her affections only as a ruse by which to retain Ragnar's services. Obsessed, as he admits, with dread of the younger generation, yet thinking himself at last secure from it, he succumbs when the younger generation knocks at his door in the person of Hilda Wangel. Hilda, who had already appeared in a minor role in *The Lady from the Sea,* is a strange and willful girl who induces Solness to relax his selfish schemes, and, at the same time, to attempt to mount, as he used to do, to the top of a lofty tower. He can no longer safely climb to such heights, and yet, inspired by Hilda's faith, he makes the attempt, only to fall. Though he forfeits life, Hilda exclaims that she heard "harps in the air" when he stood on the dizzy summit. Hilda is the puzzle of the play, an influence for both good and evil, a symbol of youthful aspiration, or perhaps of youth as the enemy of age and of woman as the enemy of man. The charm of the drama lies in its tantalizing hints of concealed significances; its defect lies in its lack of proper correspondence between the human action and the allegory.

FRANK W. CHANDLER.

MASTER OF ARTS (M.A. or A.M., *artium magister*), an academic honor conferred by universities of the United States, Great Britain and other countries, upon students after a course of study and a previous examination in the chief branches of a liberal education, particularly philosophy, philology, mathematics, physics, and history. The word *magister,* connected with a qualifying phrase, was used among the Romans as a title of honor; but its present meaning must be traced to the time of the establishment of the oldest universities. Regularly organized faculties were not then known as they now exist in the universities. The whole circle of academic activity was limited to the seven liberal arts, and those who received public honors on the completion of their course of studies, for their diligence and knowledge, and had already received the degree of *baccalaureus* (bachelor), were called *magistri artium* (masters of the liberal arts). In American and English universities this degree follows that of bachelor. The degree of master of arts is inferior to that of doctor of letters (D.Litt.). In the German universities the title was formerly conferred, but has been superseded by that of doctor of philosophy (Ph.D.), which practically corresponds to the degree of M.A. in other universities. This title is an indispensable preliminary to the attainment of the position of *docent* in the German universities, that is, one who has obtained the right to deliver academic lectures. See also article on DEGREE; COSTUME, ACADEMIC.

MASTER OF BALLANTRAE, bål-ăn-trā', **The,** a novel by Robert Louis Stevenson, published in 1889. It is a Scottish romance of the 18th century, beginning with the Stuart uprising of 1745. It is a somber tragedy of the enmity of two brothers, of whom the elder, James Durrie the Master, takes the side of the Stuarts; the younger, Henry, that of the Hanoverian house.

MASTER OF THE HORSE, an official having charge of the horses, hounds, etc., of a sovereign, as of England. He is there a member of the royal household and the third dignitary of the court. The office is appointive, and he has the use of the royal horses and servants. The office formerly existed in Germany and France.

MASTER OF THE ROLLS, a member of the Supreme Court of Judicature in England, who presides with the lords justices in the Court of Appeal, and ranks next to the lord chief justice. He is the keeper of all records of the Court of Chancery and of the rolls of all grants and patents that pass under the great Seal. By the Supreme Court of Judicature Act of 1873, he was denied the privilege he formerly had of a seat in the House of Commons.

MASTERS, màs'tẽrz, **Edgar Lee,** American poet and author: b. Garnett, Kans., Aug. 23, 1869; d. Melrose Park, Pa., March 5, 1950. In 1880 his family settled at Lewistown, Ill., near the Spoon River. Masters attended school here, and studied (1889) at Knox College, but was mainly self-educated through wide reading, acquiring a lifelong love of poetry. He was admitted to the bar in 1891, and the next year moved to Chicago, where he soon had a flourishing practice. Meanwhile, an unnoticed part of the literary ferment of the period in Chicago, he had published poems and stories, chiefly in various newspapers.

In 1913 William Marion Reedy, editor of *Reedy's Mirror* of St. Louis, Mo., gave him a copy of *Epigrams from the Greek Anthology.* This inspired Masters' most famous work, *The Spoon River Anthology,* epitaphs spoken by about 250 persons buried in the graveyard of a village in the Middle West, revealing their inner lives in terms which are imaginative but essentially pessimistic. The first installment of *Spoon River* appeared anonymously in *Reedy's Mirror,* May 29, 1914, and was published in book form, also anonymously, in 1915. A sequel, *The New Spoon River,* appeared in 1924.

Other poetical works—none comparable to the first *Spoon River*—include *A Book of Verses* (1898); *Songs and Sonnets* (1910); *Songs and Satires* (1916); *Starved Rock* (1919); *Domesday Book* (1920) and its epilogue *The Fate of the Jury* (1929); *The New World,* a history of America in verse (1937); *Illinois Poems* (1941); and *The Sangamon* (1942). His novels include *Mitch Miller* (1920), *Skeeters Kirby* (1923), and *Mirage* (1924), a trilogy based on his youth. Masters also wrote biographies—limited by his lack of scholarship—of *Lincoln, the Man,* a bitter "debunking" of the so-called Lincoln myth

(1931); *Vachel Lindsay*, valuable for personal knowledge (1935); *Whitman* (1937); and *Mark Twain*, viewed as a frustrated genius (1938).

Consult Masters' autobiography, *Across Spoon River* (New York 1936).

MASTERWORT, mȧs'tẽr-wûrt', the rustic name of several umbelliferous plants, as those of the genus *Anethum* (see DILL), formerly much cultivated as pot-herbs, and held in great repute as a stomachic, sudorific, and diuretic.

MASTICATION, CHEWING, mȧs-tĭ-kā'shŭn, or the thorough subdivision of food in the mouth so that it can be readily acted upon by the gastric juice and other digestive secretions. The tongue, cheeks, and lips push the food material between the teeth, and by the lateral and up-and-down motions of the lower jaw it is cut and torn by the incisor, canine, and bicuspid teeth and bruised by the molar or grinding teeth. During these actions the food is softened by the saliva (insalivation), which exudes abundantly from the salivary glands by the act of mastication. Typical mastication is seen only in the higher vertebrata. "The amphibian bolts its fly, the bird its grain, and the fish its brother without the ceremony of chewing," but in man and the higher animals mastication is necessary for complete and comfortable digestion. Thorough comminution of food by mastication is analogous to the pulverizing process employed by the chemist, but associated with mastication is insalivation, as it is almost impossible to swallow substances which are very dry. Imperfect mastication of food, either by reason of rapid swallowing (bolting), or because of the absence of sound and serviceable teeth, is very frequently the cause of the numerous ailments classified under the term indigestion. Exaggerated mastication, which has been so highly recommended by certain persons as almost to constitute a panacea or complete prophylaxis, is known to lessen the secretion of gastric juices which is started by sensations of taste, to protract beyond desirable limits the time required for proper gastric digestion, and to develop the salivary deposit in a proportion relatively too great when compared with the secretion of the pancreas. It is moreover known that the teeth are likely to wear out too soon, if mastication is carried beyond a reasonable time

Exaggerated mastication and the fancied advantages accruing from it are an illustration of an indulgence in a form of securing the gratification of an unconscious desire. In infancy a great pleasure is derived merely from mouthing different objects, a pleasure originating in the mode of absorbing the early meals at the mother's breast. It has been discovered by studying the unconscious wishes of mankind that the sexual desire in the adult is a synthesis of different partial desires which in the infant are satisfied in different parts of the body, now here, now there, but which in the adult are assembled in the genital organs or are at least unified under the supremacy of the genitals. But it has been definitely proven that in some individuals this synthesis has never been successfully accomplished. Either the mouth pleasure zones or the anal or the skin or some other zone, which gave in infancy a quite absorbing sense of gratification, has failed of appropriate subordination, and has persisted into adult life, with some individuals, a source of extraordinary pleasure.

MASTIFF, mȧs'tĭf, a breed of dogs of great size, recognized by the large head, short muzzle, the dependent lips, the broad, hanging ears, and by the general muscularity of the form. The mastiff in general disposition is affectionate and gentle, extremely faithful and vigilant. In Rome and in classical ages these dogs were held in high estimation for their strength and courage. The most valued breeds were obtained from Great Britain, where these dogs originated, and were used to guard flocks and herds; and watching has become instinctive with them. Roman officers were appointed to breed them and to transmit them periodically to Rome, where they fought lions and bears in the arenas of the Roman amphitheaters and were otherwise favorites. The dog now is highly valued, both as a watch-dog, and as a domestic companion. Fawn is the prevalent color, and the weight should be about 165 pounds.

MASTIGOPHORA, mȧs-tĭ-gŏf'ŏ-rȧ, a class of Protozoa "in which the flagellate form is prominent although the amoeboid and encysted conditions frequently occur." The class is synonymous with that of Flagellata (q.v.).

MASTODON, mȧs'tô-dŏn, a genus of fossil proboscideans that lived during the Pleistocene period of earth history. By extension the word *mastodon* is very generally used as a common noun and applied to many proboscideans of middle and late Cenozoic age. For such usage the word *mastodont* is also frequently employed.

The mastodonts first appeared in the Miocene period and continued from then through the Pliocene and most of the Pleistocene period. The early mastodonts were of fair size, some of them being about as large as modern oxen, and from such a beginning they evolved into giants, comparable to modern elephants, during the latter phases of the Cenozoic era.

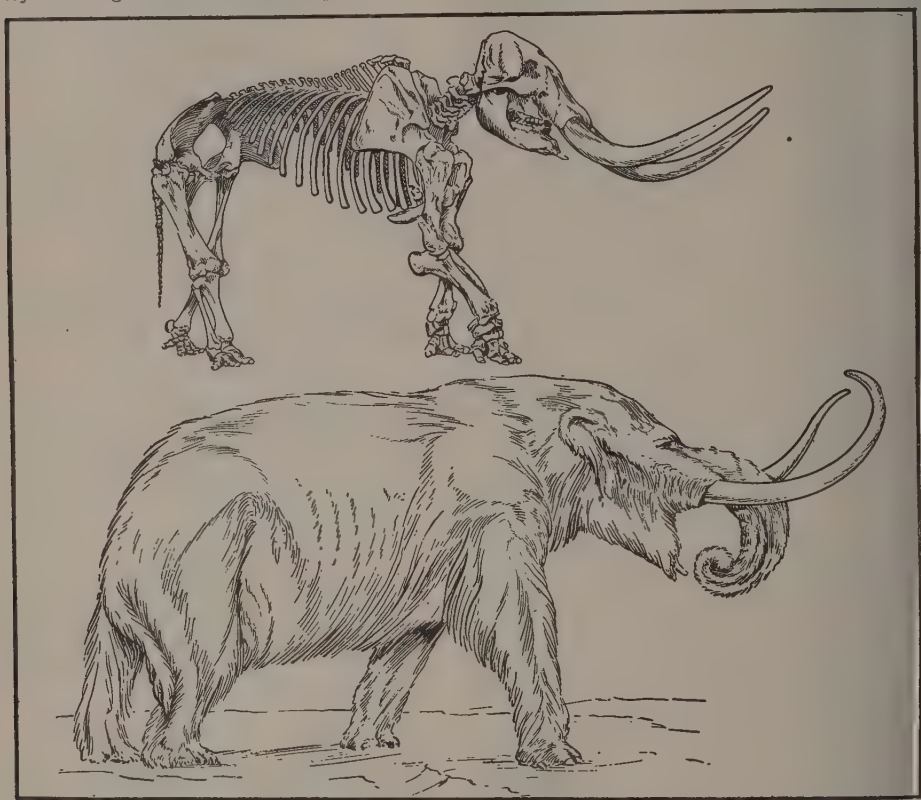
The mastodonts were characterized by elongated noses or probosces, as were all but the most primitive of the proboscideans, and by tusks. In many of the mastodonts there were four tusks, two in the skull and two in the lower jaw. These tusks showed a great variety of development; they were straight, upcurved, or downcurved, long or short. In some of the mastodonts the lower tusks were even broadened and flattened to form a sort of scoop or shovel. The lower tusks of some of the later mastodonts were suppressed and in certain genera they disappeared completely. The tusks were invariably enlarged upper and lower second incisor teeth. The grinding teeth in the mastodonts were somewhat elongated and multicuspidate, and in some genera adjacent cusps of each tooth were joined by a process of transverse growth through time to form strong cross-ridges.

Perhaps the commonest use of the word *mastodon* is its application to remains of the American mastodon, *Mastodon americanus*. (Strict application of the International Rules of Zoological Nomenclature requires that the designation be *Mammut americanum*, but this usage is not commonly followed.) The American mastodon lived throughout much of North America during the Pleistocene period—the last great ice age of geologic history. Remains are found as far south as the southern tip of Florida, and as far north as Alaska. There is some evidence to indicate that this mastodon was present also in parts of

Asia. Fossils of the American mastodon are commonly found in bog deposits and swamps, in river and lake beds, and even on the floor of the Atlantic Ocean along the continental shelf. Some of the remains are remarkably fresh, and it is evident that this proboscidean persisted until a very late stage of the Pleistocene period.

by The American Museum of Natural History New York City, through the munificence of M J. P. Morgan, and it is now exhibited in tha institution.

Careful archaeological and paleontological in vestigations of the past few decades have af forded increasing evidence that the America



Upper: skeleton of the Warren Mastodon, male, estimated shoulder height 9 feet 2 inches in the flesh. Found in the Hudson Highlands near Newburgh, New York. Lower: restoration of male *Mastodon americanus*, estimated shoulder height 10 feet 2 inches in the flesh. Both illustrations after Osborn's *Proboscidea*, Vol. 1, American Museum of Natural History.

Mastodon americanus was a large, bulky proboscidean. Large skeletons are as much as nine or ten feet in height at the shoulder. A mastodon of this size would have been much heavier than a modern elephant of similar height. The skull is rather low for a proboscidean, and it is armed with a pair of large tusks curving upward and outward. The teeth are strongly ridged by transverse cross-crests, there being three such crests in the milk molars and the first two molars, and four or five crests in the third molars. Specimens that have been frozen in the muck of Alaska show that the mastodon was covered by a heavy coat of coarse, reddish-brown hair.

Probably the most complete and famous mastodon skeleton to be discovered is the so-called Warren mastodon, unearthed a century ago from a swamp near Newburgh, New York. This skeleton was first exhibited in many towns and cities of eastern North America, but in time it came to rest in the private museum of Dr. John C. Warren of Boston. In 1909 it was purchased

mastodon was contemporaneous with early ma in North America. There is good reason t think that the mastodon persisted until a ver late geologic time; it was almost certainly li ing on the continent ten thousand years ago, a it may have lingered on until as late as four five thousand years ago. Mastodon bones ha been found in undoubted association with art facts, and there are some objects of early India art that may represent crude attempts to depi the mastodon. However, there are no u equivocal legends among the Indians of the ma todon. See also ELEPHANT; MAMMOTH.

Consult Osborn, H. F., *Proboscidea*, vol. 1 (New Yo 1936); Romer, A. S., *Vertebrate Paleontology* (Chica 1945).

EDWIN H. COLBERT,
Curator of Fossil Reptiles and Amphibians, Th American Museum of Natural History.

MASTODONSAURUS, măs-tō-dŏn-sō'rŭ a fossil labyrinthodont batrachian found in th

Triassic formations of England, Württemberg and India. It is the largest type known, the head having a length of four feet with a body extending to a length of 10 feet, on short, tiny limbs. The skull was greatly flattened and the eyes looked directly up.

MASUDI (Abu-l Hasan 'Ali ibn Husain ibn 'Ali ul-Mas'udi), Arabic geographer and historian: b. Bagdad, near the close of the 9th century; d. Fostat, about 956 A.D. Receiving a good education he set out to study the history, manner of life, and customs of every land at first hand. This quest took him to Persia and Kerman, in 915 to Istakhr, to Multan and Mansura in 916. From there he journeyed to Cambay, Saimur and Ceylon, to Madagascar and back via Oman. He also visited the shores of the Caspian; journeyed to Tiberias in Palestine. He visited Antioch in 943 and Damascus in 945. The last decade of his life was spent in Egypt and Syria. Of the Mo'tazilite sect, he was free from bigotry, studied Christianity and Judaism and was well versed in the history of the principal nations of both Orient and Occident. He wrote a universal history in 30 volumes, entitled *Kitab akhbar uz-Zaman,* followed by a supplement in *Kitab ul-Ausat,* a chronology of general history. The two works were combined by the author in *Muruj udh-Dhahab wa ma'adin ul-Jawahir* (*Meadows of Gold and Mines of Precious Stones*) in 947. Editions have been published at Bulak (1866) and at Cairo (1886). The original with French translation by C. B. de Maynard and A. de Courteille has appeared, 9 vols. (Paris 1861–77; vol. 1, in English by A. Sprenger, London 1841). An enlarged edition of this work finished by Masudi in 956 appears to be now lost. Another work, written in 956, is *Kitab ut-Tanbih wal Ishraf* (*Book of Indication and Revision*) is a summary with corrections of his other writings. It was edited by M. J. de Goeje (Leyden 1894) and there is a French translation by Carra de Vaux (Paris 1896) and a partial translation by De Saaj's memoir to Meynard's edition of *Muruj.* Consult Brockelmann, Karl, *Geschichte der arabischen Literatur,* vol. 1 (Weimar 1899); Weld, C., *Tales of the Caliphs* (1909); Nicholson, R. A., *Literary History of the Arabs* (Cambridge 1907).

MASULIPATAM, or **BANDAR,** British India, capital of the district of Kistna, Madras, situated at the mouth of the Kistna, on the Bay of Bengal. It was the earliest English settlement on the Coromandel coast, an agency being established there in 1611. Subsequently the town was held for some years by the French; it was taken by storm by Forde in 1759. A storm wave inundated the town in 1864, and about 30,000 lives were lost. Weaving, bleaching and cloth printing are the principal industries, but do not enjoy their former importance. Noble College is the chief educational institution. The port is merely a roadstead in which vessels anchor five miles off shore. Masulipatam is reached by a branch of the Southern Mahratta Railway from Bezwada. Pop. (1941) 59,146.

MASURIAN LAKES, Battle of. See War, European, *Eastern Front.*

MA'T, the Egyptian goddess of justice and truth. She was usually represented as wearing an ostrich feather on her head, with eyes bandaged as a sign of her impartiality. Judges and kings were at all periods her professed worshippers. The father of the goddess was Rê, the sun god. Her Greek compeer was Themis. Consult Budge, A. E. T. W., *The Gods of the Egyptians,* vol. 1, (London 1904) and Wiedemann, Alfred, *Religion of the Ancient Egyptians* (New York 1897).

MATA HARI, mä'tà hä'rē (real name Gertrud Margarete Zelle), Dutch dancer and courtesan: b. Leeuwarden, Netherlands, Aug. 7, 1876; executed by the French as a spy at Vincennes, France, Oct. 15, 1917. The convent-bred daughter of a Dutch business man, Gertrud Zelle at 18 married an elderly profligate, Capt. Campbell MacLeod, of Scottish descent and commissioned in the Dutch Colonial Army. Soon after their marriage, a son was born in Amsterdam where the couple lived in a fashionable quarter. The husband's gambling debts threatening ruin, she initiated her career of an adventuress by blackmailing a rich admirer. Another child, a daughter, was born before they sailed for Java where the captain commanded a battalion of the Colonial Army Reserve. From the outset the marriage was a miserable failure, and on their return to Holland Mrs. MacLeod instituted divorce proceedings. The courts denied the application but later granted her husband a decree. In 1903 she went to Paris, ambitious to become a dancer. While training for this profession, she earned money as an artists' model, and in other ways. During the decade preceding World War I, she gained notoriety on the vaudeville stages of Paris, Berlin, Vienna, Rome, and London. But she preferred to give private performances of her erotic dances, supposedly of symbolic religious significance, before select gatherings of persons in the upper political and social circles. Thus she came to know men who were prominent in the government and established intimate relations with them. Her middle-class Dutch origin lacking glamour, she represented herself as having been born on the Malabar coast of southern India, the daughter of a dancing girl who died in giving her birth. Named Mata Hari, meaning Child of the Dawn, she was brought up in a Brahman temple dedicated to Siva, the god of evil, and became one of his votaries. Tall, slim, and beautifully formed, with sombre eyes, black hair and amber skin, she easily convinced admirers of her Hindu pedigree, although the only Asiatic heredity she could truthfully claim was a strain of Semitic blood in the paternal line. Several years before the war she attended the German espionage school at Lorrach. In 1914, on the day war was declared she rode through the streets of the German capital with Berlin's chief of police. A citizen of a neutral country with property in France, she was able to return to France in 1915 despite the war. On this occasion she changed her role of an Oriental dancer to that of a rich woman of fashion. Before her arrival the French secret service had full reports on her both from its own agents and from the Italian secret service. They knew her relations with the Berlin police chief, the German crown prince, and other Reich officials. But lacking direct evidence they were unable to establish absolute proof of her criminality. Furthermore, among her protectors were men high in both the French and Dutch governments. For months she skillfully avoided

the numerous traps laid for her by the French Deuxieme Bureau. Finally she was arrested in a Paris hotel on Feb. 13, 1917, the day after her return from Madrid where she had been observed in frequent conferences with the heads of the German military and naval intelligence services. The evidence proving her a spy which had been accumulated over many years was at last incontrovertible. One of the most damning documents was an intercepted telegram from German Army headquarters to the embassy in Madrid instructing H21 (her code number in the German secret service) to return to Paris where 15,000 pesetas would be delivered to her. The check was found on her after her arrest. Another proof was her acceptance of 30,000 marks from the German secret service before her return to France in 1915. Her relations with French, British, and Russian officers, particularly of the flying services, had enabled her to obtain much valuable military information which she was able to forward to the Germans through seemingly innocent letters to her daughter conveyed by the Dutch diplomatic pouch from Paris. At her trial it was estimated that her espionage activities had been responsible for the death of at least 50,000 Allied soldiers. She faced a firing squad at Vincennes with surprising fortitude for a woman whose life had been a long career of debauchery. Consult: Coulson, Thomas, *Mata Hari: Courteson and Spy* (New York 1930); Morain, Alfred, "The Case of a Spy—Mata Hari" in *Underworld of Paris* (New York 1931).

MATABELELAND, mä-tä-bē'lē-länd, a region in Southern Rhodesia, Union of South Africa, between the Limpopo and Zambesi, north of the Transvaal. In 1889 it came under the administration of the British South Africa Company, against whom the natives unsuccessfully rebelled in 1893 and 1896. The Matabeli are a warlike Kaffir race, who migrated from Natal in 1827 under their chief, Umsilikatse. The country is traversed by ranges of hills—the Matoppo Hills being the chief—is watered by numerous streams. On Sept. 12, 1923, it became part of Southern Rhodesia when that country became part of the British Empire. Buluwayo is the chief town. Other towns are Girelo and Selukwe. Pop. (1936) 1,899 whites and 263,857 natives. The Cape to Cairo Railroad passes through Bukuwayo, which is 1,360 miles distant from Cape Town. Consult: Oates, Frank, *Matabele Land and the Victoria Falls* (London 1881); Montague, *Interior of Central Africa* (London 1886); Wills and Collingridge, *The Downfall of Lobengula* (London 1894); Norris, *Matabeleland* (London 1895); Baden-Powell, *The Matabele Campaign,* 2d. ed. (London 1901).

MATACHIN, măt a chēn', or **MATACHINE,** "the dance of fools," a former well-known comic dance performed by maskers in mock-military guise. It was common in France and Italy. The dance itself was merely a display of tumbling or acrobatic feats.

MATACO, a South American Indian stock, including several tribes, whose habitat is in the Vermejo River Valley in the Gran Chaco, in northern Argentina. They are of medium size with wavy hair and subsist by hunting, fishing, and cattle raising. Their dress is made of skins and they dwell in huts of brush. Consult Brinton, D. G., *Linguistic Cartography of the Chaco Region* (Philadelphia 1898); *Anales de la Sociedad Científica Argentina* (Buenos Aires 1904); Schuller, *Sobre el origen de los charrúas* (Santiago 1906).

MATADOR, in Spanish bullfights the man appointed to administer the fatal stroke to the bull. See BULL-FIGHT.

MATAGALPA, mä-tä-gäl'pä, Nicaragua, town, capital of the Department of Matagalpa, north of the central part of Nicaragua. It is situated in a fertile agricultural region, in which the chief products are tobacco, coffee, and sugar. The lack of railroads has been a hindrance to the growth of the towns, but a good highway is under construction to connect it with Managua, the capital, and other cities. The inhabitants are mostly Indians. Pop. (1940 est.) 8,506.

MATAMOROS, Mariano, mä-rē-ä'nō mätä-mō'rōs, Mexican patriot: b. Mexico, about 1770; d. Valladolid, Feb. 3, 1814. He first appears in 1810 as substitute priest of the parish in Jantelolco, a village south of Mexico City. In 1811 he identified himself with the revolt of Hidalgo (q.v.), and became the principal commander under Morelos (q.v.). He attained the rank of lieutenant general on April 19, 1813. On Oct. 14, 1813, he gained the victory of San Augustin del Palmar, and on Jan. 5, 1814, was captured at the defeat of Puruarán. He was executed in Valladolid market place. The town of Matamoros, on the United States frontier, was named in memory of this sterling patriot.

MATAMOROS, Mexico, a frontier town and river port opposite Brownsville, Texas, in Tamaulipas, on the right bank of the Rio Grande del Norte, about 30 miles above its mouth in the Gulf of Mexico. It consists chiefly of brick houses; around the public square stand the church, townhouse, customhouse, and a number of elegant private dwellings. A considerable trade is carried on with the United States; horses, hides, wool, and cottonseeds are exported, and manufactured goods imported. In normal years its commerce is valued at about $4,000,000. During the Mexican War in 1846 the town was occupied by American troops under General Taylor, on May 18. Pop. (1940) 15,699.

MATANE, ma'tán, Canada, town in Matane County, Province of Quebec, on the Canadian National Railroad. Steamers ply between it and Montreal and Gaspé. The town has large sawmills and extensive lumber interests. Matane is in a good hunting and fishing region. Pop. (1941) 4,633.

MATANUSKA RIVER, an affluent of Knik Arm, Cook Inlet, Alaska. The valley of this stream has extensive coal deposits which have been the subject of federal legislation in recent years. See ALASKA, and consult Martin, "Matanuska Coal Field," (*United States Geological Survey,* Bulletin 239), and "Railway Routes in Alaska," *Document 1346,* House of Representatives, 62d Congress, 3d session.

MATANZAS, mä-tăn'zas (Sp. mä-tän'thäs), Cuba, a seaport city on the north coast, capital of Matanzas province, 52 miles by rail east of

Havana. It is situated on Matanzas Bay, one of the largest, safest, and most convenient harbors of the Western Hemisphere. The city is well built with wide, regular and paved streets, handsome plazas and public buildings, and good railway communications. The caves of Bellamar and Yumuri Valley, in the neighborhood, are two popular natural resorts. Matanzas ranks in importance next to Havana in the export of sugar, molasses, rum, and coffee. It has several mills, distilleries, oil refineries, tanneries, shoe factories, and machine shops. It was founded in 1693. The city was bombarded by the United States warships during the Spanish American War in 1898, the only casualty, widely telegraphed, being an injury to a "Matanzas mule," which made the animal famous. Pop. (1943) 49,591.

MATAPAN, măt'ă-păn, **Cape** (modern Greek TAÍNARON; ancient TAENARUM), a promontory of Greece, forming the southern extremity of the Peloponnesus, in latitude 36° 23′ N. and longitude 22° 29′ E. It was sacred to Neptune, whose temple stood nearby. The British sank two Italian destroyers, three cruisers, and damaged a battleship near here in a naval battle in March 1941.

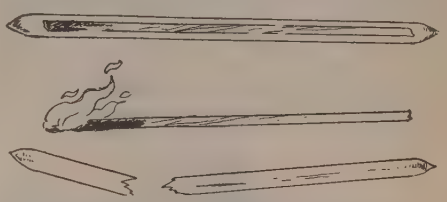
MATAS, Rudolph, American surgeon: b. Bonnet Carre, near New Orleans, La., Sept. 12, 1860. He was educated at Barcelona, Spain; Paris, France; Brownsville, Texas; Soule's College, New Orleans; St. John's Literary Institute, Matamoros, Mexico and at Tulane University. After his graduation he practiced in New Orleans. In 1895 he was appointed to the chair of surgery at Tulane University where he served until 1927. Dr. Matas was senior surgeon of Touro Infirmary (1905–1935); and honorary chief surgeon since 1935, and senior visiting surgeon at the Charity Hospital until 1928 when he became a consultant. He was president of the American Surgical Association in 1910; and of the Southern Surgical and Gynecological Association in 1911. From 1883 to 1895 he edited the New Orleans *Medical and Surgical Journal.*

MATCH INDUSTRY. It was in 1669 that the Hamburg alchemist, Hennig Brand (Brandt) discovered phosphorus while experimenting with an olio he hoped he could reduce to gold. But while phosphorus was soon used in several briefly popular fire-producing forms, it was not adapted to the manufacture of matches for about 160 years.

In 1680 both Godfrey Haukwitz and Robert Boyle sold coarse sheets of paper coated with phosphorus in combination with splinters of wood tipped with sulphur. When the splinters were drawn through a fold of the paper they burst into flame. Since the price of an ounce of phosphorus in those days was the equivalent of $250 today, the clientele for these early matches was limited to the extremely wealthy, and when their interest in the novelty ebbed, both sales and experiments ceased.

Disinterest in phosphorus continued for a century, during which the world continued to rely chiefly upon flint and steel for sparks to be nursed into the fires it needed for warmth, cooking, and manufacture. Then, in 1781, began a cycle of inventiveness which was to produce modern matches.

The first of these inventions was the *Phosphoric Candle* or *Ethereal Match* which appeared in France in that year. It consisted of paper tipped with phosphorus, sealed in a glass tube. Admission of air when the glass was broken set the paper to flaming. The *Pocket Luminary* (Italy, 1786) was a small bottle lined with oxide of phosphorus. Sulphur-tipped wood splints ignited when rubbed on this coating and withdrawn. The *Instantaneous Light Box,* invented in 1805, was highly popular with American gentlemen up to the time of the Mexican War, despite obvious dangers. Like the luminary, it involved a small bottle, this one filled with sulphuric acid. The splints, treated with a composition of potassium chlorate, sugar, and gum arabic, were called *Empyrion* or *Oxymuriated Matches* in the United States and retailed for $2 for 50 together with the "box."



The Ethereal Match (1781) comprised of paper, tipped with phosphorus and sealed in a glass tube.

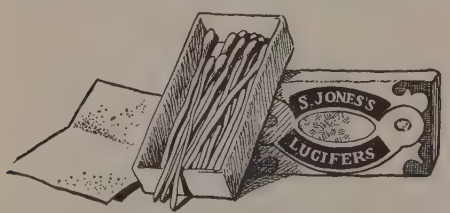
The last of these elaborate early matches was the *Electropneumatic Fire Producer,* involving the principle of the ignition of a fine jet of hydrogen gas by a spark from charged rosin. The German chemist, Johann W. Döbereiner, produced several types. He created gas by the action of sulphuric acid on zinc and directed it in a thin stream upon a platinum sponge in contact with the air. Several of Döbereiner's models still survive in museums.

Even after the birth of the match in its original modern form in 1827, inventors continued to contrive unusual means of producing fire. Self-lighting cigars of two types were introduced in Austria in 1839. In some of these a short splint of wood with a matchhead decorated with rosettes of linen was inserted in the tips. When the cigar was struck, the smoker inhaled a combination of the fumes of match composition, burning wood and linen, but he had a light. Another type wore a frilly cap of treated paper much like the lacy "socks" placed on lamb chops in some restaurants. Pellet matches (1850) made of sawdust, flour, and match composition were exploded by a plunger machine carried by users. Another pellet match came in strips like caps for a Fourth of July pistol and when detonated set fire to the paper holding them. *Wire Fixed Stars, Chinese Lights, Prussian Wax Fusees,* and *Latchford's Bone Stem Cigar Lights Which Will Never Fall Off, Break Or Burn The Fingers in Using* are the names of some of the novel lights appearing in the 1860's.

As late as 1882, the Diamond Match Company bought the patent for the *Drunkard's Match,* the splint of which was treated chemically so that it would not burn beyond midpoint. This match was highly popular with American *bons vivants* for twenty years. Much later the match inventors produced the *repeatedly ignitible* or *everlasting* match. In 1932, Rudolf Koenig and Zoltan Foldi, Austrian chemists, patented a

repeatedly ignitible rod resembling a styptic pencil wrapped in Cellophane. Actually it was an elongated match head, loaded with fire retardents to make it burn more slowly. Each of these matches was good for 40 lights if carefully nursed, and packets of three were sold in Europe for approximately 5 cents. Tried out in Holland, these repeatedly ignitible rods proved unsuccessful commercially.

The Friction Match.—While Döbereiner was still manufacturing his elaborate Fire Producers, the first friction match had already been made and sold in England (1827). The records of an apothecary, John Walker of Stockton-on-Tees, show that he sold to a Mr. Hixon "100 Sulphurata Hyperoxygeneta Frict." Later analysis indicated that Walker's friction matches were tipped with antimony sulphide, potassium chlorate, gum, and starch. They were three inches long and were ignited by drawing them through a pleat of "glass paper." Two years later when Walker exhibited his matches to amazed Londoners, one of the spectators, Samuel Jones, was not too excited to note there was no protecting patent and he promptly set himself up in the match business. Jones named his



Samuel Jones' *Lucifers* appeared in London in 1829 and smelled so badly he warned users to avoid the fumes.

matches *Lucifers*. Their ignition was accompanied by a series of small showers of sparks and odors so offensive that this warning was printed on their boxes: "If possible, avoid inhaling gas that escapes from the combustion of the black composition. Persons whose lungs are delicate should by no means use Lucifers."

In 1830, about 160 years after its discovery, phosphorus was adapted by Dr. Charles Sauria of France as an ingredient for match heads. Sauria substituted it for antimony sulphide in the Walker formula and in so doing improved the efficiency of matches but set off a wave of necrosis which was to exact a fearful toll of life among match makers and users for 80 years. Necrosis, called "phossy jaw" by workers, attacked the bones, particularly of the jaws and resulted in maiming or death. In addition, innocent persons, babies especially, were poisoned by ingesting match heads containing phosphorus, and they furnished a widespread and easily available source of poison for suicide and even murder.

This dreadful occupational hazard plagued American factories until 1911 when William A. Fairburn of the Diamond Match Company adapted harmless sesquisulphide of phosphorus to United States climatic conditions. The new nonpoisonous formula was presented to the government for the use of all rival companies, a humanitarian gesture which won public commendation from President William Howard Taft and for which Mr. Fairburn and his company were given the Louis Livingston Seaman Medal "for the elimination of occupational disease."

Substitution of sesquisulphide of phosphorus in the formula accomplished other things. It raised the point of ignition more than 100 degrees, a considerable safety factor, and it ended fires caused by rodents. Experiments conducted by Mr. Fairburn proved conclusively that while rats and mice would gnaw on phosphorus matches, thus igniting them sometimes, they would not touch the new match heads even when starving.

Manufacture of the dangerous phosphorus matches began in the United States in 1836 when Alonzo Dwight Phillips, a Springfield, Mass., powder maker, secured a patent for "new and useful improvements in modes of manufacturing friction matches for instantaneous light." Phillips made his phosphorus matches by hand and when he had a wagon load, sold them himself from door to door thus founding an industry which now produces about 500 billion matches each year in the United States.

At that time, only one type of match existed, the wooden strike-anywhere that is sometimes called the "kitchen" match today. The discovery of red or amorphous phosphorus by Professor Anton von Schrotter in 1845 led to the development of another type of match, the safety, by J. E. Lundstrom 10 years later. The safety match differs from the strike-anywhere only in one regard: part of the ingredients necessary to create fire are in the head of the safety match, part in the striking surface on the box.

The third basic form of modern match, the paper book variety, was the invention in 1892 of an attorney, Joshua Pussey. His books contained 50 matches, had the striking surface on the inside where sparks frequently ignited the remaining matches, a danger quickly corrected by the Diamond Match Company which bought the patent in 1895. Unpopular at first and made by hand, book matches became big business in 1896 when a brewing company ordered 10,000,000 books to advertise their brews, forcing creation of machinery for swift production in volume. Today the industry manufactures 200 billion book matches annually in the United States with about 196 billion being handed out free to customers of cigar stores, hotels, restaurants and railroads, a practice unknown in any other country.

At the time of the Phillips patent, matches all over the world were made by hand on a piecework basis in the homes of the poor, a condition which led to the infection by necrosis of a considerable segment of the populations in industrial areas. The boxes also were made by hand in homes. The first American patent for a machine to cut round splints was granted to Chauncey E. Warner in 1841.

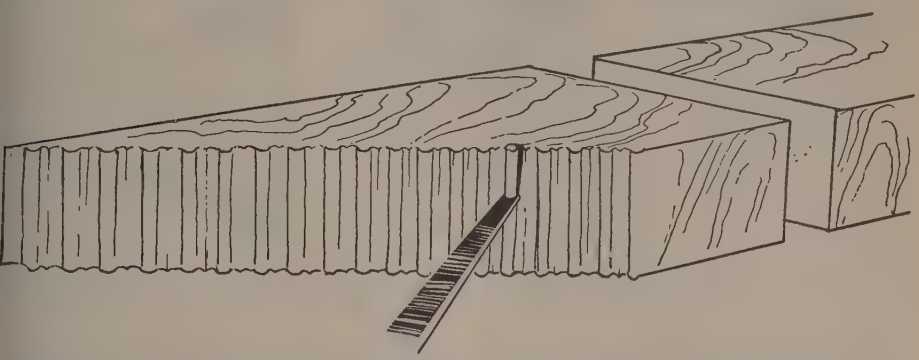
The trend toward mechanization of the industry and the centralization of efforts in factories instead of homes began in 1842 with the invention of a machine by Reuben Partridge, which cut the wooden splints in bulk, ending tedious hand methods for this important process. Other inventors contributed to match machines, each performing a function, but real mechanical impetus came in 1883 when Ebenezer Beecher of Connecticut designed three "continuous" automatic match-making machines by combining all

functions in one device. Beecher made these machines for Ohio Columbus Barber, of the newly formed Diamond Match Company, and they became the models for all future equipment in the industry.

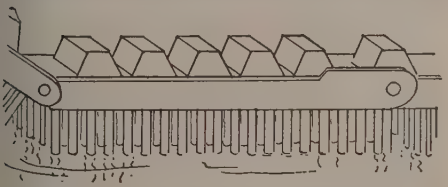
Modern Methods of Manufacture.—The methods used to manufacture all types of matches are basically the same. The wood or paper for the splints must be cut into proper size, dipped to create the heads, dried and assembled in books or boxes for retail sale.

suring a flat pack. The boxes, covers, and wrappers for the matches are made in the same factories as the matches and the output is synchronized so that matches and containers reach the packaging machinery simultaneously.

Some United States factories have as many as 20 continuous automatic match machines, each capable of producing 10,000,000 matches in an eight-hour shift, a factory total of 200,000,000 each one-shift day. Shipment of a day's output would require five freight cars.



Razor-sharp dies hew the match splints from pine blocks, then lodge them in perforations in the steel plates of an endless chain.

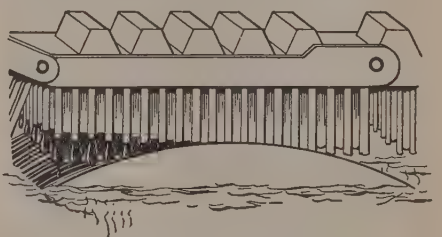


Cut from straight-grained white pine, match splints are carried on an endless chain until completed, then counted automatically into boxes.

Hence, the making of the strike-anywhere match on the modified Beecher machine gives a good overall picture of the processes involved.

The machines, 60 feet long, two stories high, convert blocks of straight-grained pine into packaged matches in 60 minutes at a rate as high as 1,125,000 an hour. The pine blocks, cured from 12 to 18 months, are fed into the head of the machine where a row of from 42 to 57 dies cuts the splints and fixes them into perforations in an endless chain of metal plates, each with 12 rows of perforations. It is this operation which creates the visible indented collars at the holding tips of all round wooden matches.

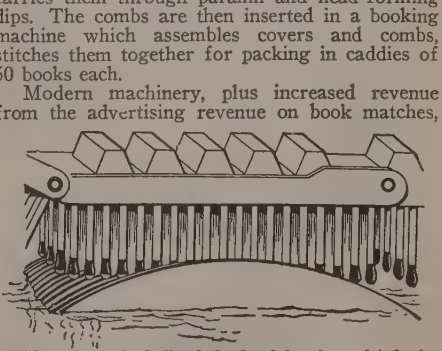
The dies cut 350 rows of 42 to 57 splints each minute, setting them into the plates on which they ride through a series of five dips and baths which treat the wood against afterglow, provide a collar of paraffin to speed combustion, put on the main bulb and its "eye" and finally dip the heads with a solution which protects them from weather changes. Punched out of their plates after the final drying, the matches pour down a trough to drop into endless chains of boxes waiting for them. On the larger-size boxes an ingenious device turns the matches so that approximately half the heads are to the right, and the balance to the left, as-



Riding upside down on steel plates, the match splints pass through grooves in a roller rotating in a vat of composition which creates the main bulb of the head.

Book matches are not made on a single continuous machine but in two separate operations under the same roof. The first machine, called "cut, set and dip," slices rolls of pretreated cardboard into combs of 60 matches each then carries them through paraffin and head-forming dips. The combs are then inserted in a booking machine which assembles covers and combs, stitches them together for packing in caddies of 50 books each.

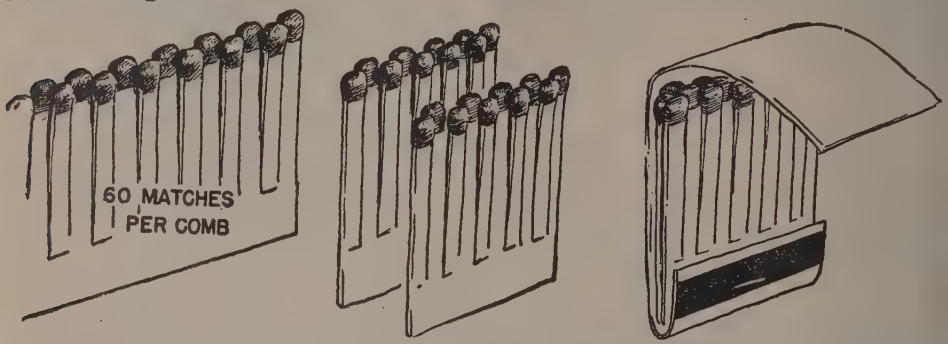
Modern machinery, plus increased revenue from the advertising revenue on book matches,



After the main bulb of the head has been dried, the matches pass through another tip which fashions the "eye" of sesquisulphide of phosphorus.

has kept United States production costs at a minimum. As a result match prices, unlike those of most other household necessities, have remained the same for a half century despite increased labor and material charges. Five cents for a box of strike-anywhere matches and a penny for safety matches has been standard for more than two generations.

logical Warfare Branch selected book matches to carry morale-lifting messages to nations held captive by the Axis early in the war. Millions of these books with messages in Burmese, Chinese, Greek, French, Spanish, Dutch, Italian, and English printed on their covers were dropped by Allied planes behind the enemy lines. Before the invasion of the Philippines, when native



Book matches are sliced in "combs" of 60 from a roll of pretreated cardboard. After the heads have been put on, the "combs" are cut into proper widths, usually 10 matches, and stapled in two layers between the paper covers.

Since the turn of the century, match machinery has been constantly improved, and there have been three outstanding advances in American matches. The first of these, the nonpoisonous match, has already been discussed. The second was an improvement in the safety factor. It had been known, long before 1912, that match splints treated with an aqueous solution of ammonium phosphate retained no ember or afterglow when the match was blown out. Matches made under the veneer method (cut separately and dipped in composition in bundles) had been impregnated against afterglow simply by tossing them into vats of solution. But American matches were cut and made on a single machine which barred this method. But in 1912, fresh from his triumph with the nonpoisonous match, William A. Fairburn, developed a spray attachment for the continuous match machine which would impregnate matches in course of manufacture. As with his previous development, Fairburn gave blueprints to the rivals of Diamond Match Company in the interests of fire prevention.

World War II produced another advance, the waterproof match, dream of matchmakers since the birth of the industry. The United States War Department needed a match that would function in the long rainy seasons of the South Pacific and called on the industry for help. Raymond Davis Cady, chief chemist for Diamond Match, produced a formula, approved by the army, which resulted in matches which can remain under water eight hours yet still function. The match went into production Dec. 7, 1943, and was supplied at the rate of more than 10,000,000 daily to the armed forces. The Quartermaster Board, United States Army, was offered the formula for lending to other manufacturers in the war effort. Universal and Ohio Match companies were also large producers of water resistant matches for the services.

Another war service performed by matches was in the propaganda field. Because of their compactness, cheapness, and scarcity (even in normal times) in foreign countries, the Psycho-

morale was at low ebb, American aircraft scattered 4,000,000 books of matches to notify the enslaved natives: "I Shall Return—Douglas MacArthur."

Labor and material shortages upset production figures in the United States during the war, but normally America makes 200 billion each of book and strike-anywhere matches and 100 billion safety matches annually, the largest national output in the world. Other large manufacturers are Great Britain, Russia, and Sweden. Before the war, Japan ranked high in match volume and for a period flooded the United States and other countries with cheap matches, packaged in containers so nearly like those of leading manufacturers that only close scrutiny revealed their real origin.

Except for a period of six months during the war when the United States Army and Navy requisitioned 100 per cent of the safety and 35 per cent of the book matches, there has never been a match shortage in the United States.

One of the interesting features of the match industry is that more than half of the value of the goods it makes represents wages paid to its employees. For most products labor's wages represent only a small percentage of the value.

STUART LITTLE.
Writer and Publicist.

MATE.—A deck officer in the Merchant Marine ranking below the captain. If there is more than one mate, they are designated first mate, second mate, and so on. See PETTY OFFICER.

MATÉ or PARAGUAY TEA. The dried and powdered leaves of *Ilex paraguayensis,* infused and sweetened with sugar. It is sucked up through a special tube which strains off the leaf particles, is aromatic and somewhat bitter, and has refreshing and restorative effects. Large quantities are grown and consumed in Parana, Brazil. *Ilex paraguayensis* is a tree allied to the holly, *Ilex aquifolium.* The exportation of maté

is to Paraná what the exportation of coffee is to the neighbor state of São Paulo: the basis, practically, of economic achievement. Brazil alone produces about 200,000 tons annually, exporting 40 per cent to her neighbors.

MATEHUALA, mä-tä-wä'lä, Mexico, a southern town of the state of Nuevo Léon, with silver-melting establishments and important silver mines in the vicinity. Gold and copper are also found nearby in paying quantities. The city is well built, has several plazas and wide streets. Pop. 12,000.

MATERIA MEDICA (Lat. «medical matter»), that division or branch of medical science which treats of drugs, their origin, classification as natural products, preparation, purification, action on the animal economy, together with the mode of administering them for the relief and cure of disease. The action of the various agents in the materia medica upon the human family has been ascertained by experience, sometimes by experiment, especially by administering various drugs to some of the lower order of animals such as dogs, cats, rabbits, guinea pigs, rats and mice. Perhaps the best general classification of medicine is as stimulants, sedatives, narcotics, emetics, alteratives, tonics, anæsthetics, antispasmodics, astringents, spinants, cathartics, diaphoretics, diuretics, blennorrhetics, emmenagogues, hæmatinics, antacids, irritants, demulcents, coloring agents and anthelmintics. This classification is based upon the direct effect of the different drugs upon the tissues of the human economy under the various headings which drugs may be conveniently grouped under four general sections, namely: 1. Those which have a special action on the brain, spinal cord and the general nervous system. 2. Those which have a special action on the secretions. 3. Those which change the blood. 4. Those which act locally, when applied to the surface of the body. Section (1) includes antispasmodics, anæsthetics, astringents, narcotics, tonics, sedatives, spinants and stimulants. Section (2) includes the emetics, emmenagogues, blennorrhetics, diuretics, diaphoretics and cathartics. Section (3) includes alteratives, antacids and hæmatinics. Section (4) includes anthelmintics, coloring agents, demulcents and irritants. See PHARMACOPŒIA; THERAPEUTICS.

MATERIALISM, the philosophical theory that everything which exists is ultimately material in nature, or that whatever is real can be derived and explained in accordance with the laws of material phenomena. This, of course, carries with it a denial of the reality of any finite or infinite spirit as an immaterial substance and a repudiation of all forms of idealism, which uses thought or intelligence as a principle of explanation. Materialism, however, may be more or less explicit and may maintain either absolutely, or with various modifications, the primary and all-embracing character of matter. Thorough-going materialism asserts that nothing exists but physical bodies and physical processes. What are called immaterial substances and processes it either declares to be unreal, or explains away as ultimately not different in nature from physical substances and processes. Moreover, for materialism of this consistent and uncompromising type, matter is dead and moved only by mechanical forces. It has no «psychic side,» and the laws which it obeys are the expressions of a blind physical necessity. This extreme view is perhaps no longer maintained by any philosophical thinker of reputation, but in various modified forms it still exists as a tendency to subordinate mental phenomena to physical processes. The more important of these modifications and limitations may be brought under the following heads. (1) The subordination of mental phenomena, while still acknowledging more or less explicitly their distinctive character, to physical, and especially to physiological processes as their determining causes. This position does not usually avoid any of the practical consequences of materialism, and always tends, when thought out, to revert to the strict ontological form of the theory. For it is an easy transition from the view that physical processes are able to cause mental modifications to the opinion that the mind is not fundamentally different in character from the matter which affects it. (2) The view that matter is not a dead lump or mass that moves only when acted upon by some external body, as the older theories assumed, but that every particle of matter—every atom, or it may be every cell—is «conjoined with a soul,» or has a «psychical side,» or «contains a certain element of mind-stuff.» By thus introducing an element which is different in character and in mode of operation from matter, this theory seems to differentiate itself in principle from materialism. Nevertheless, it is usually assumed tacitly by representatives of this modern Hylozoism that within the atom or cell the material side is the primary and determining element, while the physical is secondary and subordinate. Moreover, the whole mode of conception usually remains at the mechanical stage, since the immaterial element never comes to its rights as an ideal principle, but is conceived as a mere moving force or instinct, and also since it is assumed that the complex mental life can be built up by the composition of psychic elements just as a material body is constituted by the combination of its parts. (3) The position of energism. Recently an attempt has been made to find in energy an ultimate reality in terms of which both mental and material phenomena may be expressed. It cannot be maintained, however, that the conception of energy has yet been clearly defined, nor is everyone prepared to accept the assurance of Professor Ostwald, the chief representative of the theory, that energy is the concrete reality which we directly experience. To many it may appear to be merely an abstract conception built out of the data of experience. Apart from this difficulty, however, energism does not avoid materialism merely by dematerializing its fundamental principle. In Professor Ostwald's hands, it appears to remain essentially materialistic; since the conceptions employed and the laws which the transformations of energy obey are those of physical science.

If the period of the Middle Ages is excepted, when philosophical thought was determined mainly by theological conceptions, materialism may be said to have held a place throughout the whole history of philosophy. We have already noticed some of the forms in which this

mode of thought continues to appear at the present day, and may now refer briefly to its more important historical representatives. The systems of the early Greek philosophers who found the fundamental principle of things in some physical substance, such as water, air or fire, cannot properly be classed as materialism. For as yet there was no opposition between the material and the spiritual. Neither the conception of matter as lifeless and unintelligent substance, nor of mind as an immaterial directing principle, had yet been formed. Atomism, as developed by Democritus of Abdera, is the first thoroughgoing system of materialism. Democritus taught that the soul, like everything else, is an aggregate composed of atoms. The soul-atoms differ from all the others in being the finest, smoothest and most mobile. When they are in isolation, they are insensible, but from their union sensation arises. From sensation all the other processes of the mental life originate. The same conclusions were maintained by the Epicureans, who adopted without any essential modification the theory of atomism. In spite of the statement of the Stoics that whatever exists is corporeal, their system cannot properly be described as materialism. For the human soul and God, the all-embracing Logos of which the human reason is a spark of emanation, though constantly described in materialistic terms, yet function ideally as rational directing forces.

Materialism was revived in modern times by Gassendi (1592–1655) (q.v.) under the form of atomism. Modern materialism was, however, first worked out by Thomas Hobbes (q.v.), who based it upon the mechanical conceptions which in his day were being made the basis of all physical science. He did not deny the existence of immaterial things — God, angels, pure spirits — but shrewdly contented himself with showing that only that which is composed of parts, that is, bodies, can be the object of thought and so be known. All real phenomena must therefore be explained in accordance with the mechanical theory and in terms of the movement of bodies. Under the influence of the developing physical sciences and especially of the dominant conception of mechanism, materialistic tendencies played an important part in the thought of the 18th century. David Hartley (1704–57) and Joseph Priestley (1733–1804) (q.v.) definitely subordinated the mental life to the bodily processes, though the latter attempts to reconcile his materialism with Christianity and even to support it by appealing to the Bible. It is in France, however, in the systems of La Mettrie (1709–51), Baron d'Holbach (1723–89), and Cabanis (1757–1808) (q.v.) that we find in this century representatives of materialism who do not hesitate to draw the most extreme consequences of their doctrine, to deny the existence of God and to reduce man to a mere piece of physical mechanism. Again, in the middle of the 19th century, a revival of materialism occurred in Germany which had an important popular influence. The most important names connected with this movement are Carl Vogt, J. Moleschott, H. Czolbe and Louis Büchner (whose book, 'Kraft und Stoff'—'Force and Matter'— has been called the Bible of German materialism, and has passed through numerous editions in its English translation). The general adoption of the evolutionary point of view was in the beginning at least favorable to materialism. The philosophical problem seemed to be to derive from some primitive form of matter all the various modes of existence in accordance with the established laws of physical evolution. To this task Herbert Spencer (q.v.) devoted his life with a result that is variously estimated in different quarters. It can at least be said that at present thinkers are more inclined than formerly to question the adequacy of physical science to furnish a complete and final explanation of the nature of the evolutionary process.

Bibliography.— Lange, 'Geschichte des Materialismus' (Eng. trans., 3 vols., London 1878–81); Büchner, 'Force and Matter' (London 1864); Haeckel, 'The Riddle of the Universe' (New York 1899); Paulsen, 'Introduction to Philosophy' (New York 1895).

JAMES E. CREIGHTON,
Late Professor of Logic and Metaphysics, Cornell University.

MATHEMATICAL INDUCTION. See INDUCTION, MATHEMATICAL.

MATHEMATICAL SIGNS AND SYMBOLS, *in mathematics,* a symbol employed to denote an operation to be performed, to show the nature of a result of some previous operation, or to indicate the sense in which an indicated quantity is to be considered. The present mathematical symbolism is due to the labors of many men — men having different habits of thought, men living in different ages, men speaking different languages. A physicist will employ sine *a* and sine *b* to calculate the angle of refraction of light. Now certainly there is neither sine *a* nor sine *b* in reality; yet there are most certainly *relations of reality* which are accurately described in these expressions, sine *a* and sine *b*. Such is the function of all signs, symbols or characters. Whenever the eye can be brought to the aid of one's imaging faculty, a success in grasping a thought may often be gained which would otherwise be a failure. This is in particular true in mathematics where the subject matter, while objective, is non-sensible. In this way signs, and symbols, stand for the emphatic presentation of mathematical ideas, often very subtle even when symbolized; and with such signs these ideas become, as it were, easy to exhibit, that is, in thought; and the relations of these ideas become thinkable, even very often to the whole complex train of ideas in which they occur.

One very important property for symbolism to possess is that it should be concise, so as to be visible at a glance of the eye and to be rapidly written. A sign should if possible always represent the same object, and the same object should always be represented by the same sign. If a new sign be advisable, permanently or even temporarily, it should carry with it always some mark of distinction from that which is already in use, unless it be a demonstrable extension of the latter (De Morgan). The importance of notation is recognized when it is remembered, for example, how great an advance toward the solution of the famous problem of the three bodies was made when special attention was given to it, and a special symbolism chosen for it. And the invention of the symbol $\equiv$ by Gauss affords

a fine example of the advantage which may be derived from a good notation; it, without exaggeration, marks an epoch in the development of the science of arithmetic. The language of analysis, says Laplace, being in itself a powerful instrument of discoveries, its notations, especially when they are necessarily and happily conceived, are so many germs of new calculi.

Nowadays we have a symbol for each mathematical operation. Sometimes, even a choice of symbols. And most of the letters of the English alphabet are now engaged for special mathematical purposes. Thus:

a signifies sometimes a finite quantity; at other times a known number, the side of a triangle opposite A; also an intercept on the axis of x, and, finally, altitude.

b like a signifies a known number, and also a side of a triangle, the one opposite B; it also stands for base; and lastly, for an intercept on the axis of y.

c signifies constant.

e signifies the base of the Napierian logarithms.

A considerable inroad has been made, also, into the Greek alphabet:

γ signifies the inclination of the axis of x;

π stands for the ratio 3.14159;

ε is used for sum of tens similarly obtained; and

σ indicates the standard deviation in the theory of measurements.

Some examples of reading notation may be given:

$a+b$, $a-b$, $a \div b$, $a \times b$, and $a \sim b$ are read a plus b, a minus b, a divided by b, a multiplied by b, and the difference between a and b.

Further:—$a > b$, $a < b$, $a = b$, $a \sim b$, and $a \equiv b$ are to be read a greater than b, a less than b, a equal to b, a approximating to b, and (Gauss' symbol) a identical with b.

Our present day symbols of operation, + (plus) and − (minus), appear to be among the oldest. Both are found in Widmann's Arithmetic published in 1489, at Leipzig. In the time of Widmann, the symbols ( ), ×, ÷, > and < were unknown. Rudolff had already begun to employ the radical sign. But = had not yet appeared. In those days almost everything was expressed by words, or mere abbreviations. Yet even then both cubic and biquadratic equations had already been solved; the methods even were published. Oughtred used the term «separatrix» in sense of a mark between the integral and fractional parts of a number written decimally. His symbol for a separatrix was ⌊. Stevens had already used a figure a circle over or under each decimal place to indicate its order. And of the various separatrixes that have been employed by mathematicians, four are still employed: (a) A *vertical line* is still employed to separate cents from dollars in ledgers, etc. Such a separatrix appears already in 1613, employed in a work by Richard Witt. Napier also used a vertical line for the same purpose in his 'Rabdologia,' in 1617; (b) a *period*, still employed as a separatrix, is so used as early as 1612 in the trigonometry of Pitiscus, a German. Napier, in his 'Rabdologia,' speaks of also employing a period or comma. The period has always been the prevailing form of the decimal point in America; (c) the Greek colon, or dot above the line, was advocated as a separatrix by no one less than Sir Isaac Newton. His desire was to prevent it from being confounded with a period used as a mark of punctuation. This form of the decimal point is now commonly used in England; (d) Pitiscus is the author of an Italian work on trigonometry. He, in this work, published in 1608, uses a comma as a decimal point. Kepler, in 1616, seems to have introduced this mark, the comma, into Germany for the same purpose. Briggs likewise used a comma in his logarithmic tables, in 1624; and several other early English writers generally employed the comma as a decimal point. But to-day the comma is customary form of the decimal point, *not* in England, but in countries upon the mainland of the European continent.

For example: $1\frac{50}{100}$ would in America be written decimally as 1.50; in England as 1·50; and in Germany, France and in Italy as 1,50.

Symbols in general may now be mentioned: The sign of cancellation is simply drawn across the factors cancelled, like the one drawn across the zeros above. These with the ordinary Arabic and Roman numerals and the abbreviations for the names of things, like £, s, d, $, ¢, °, ′, ″, constitute the main symbols of ordinary arithmetic. In algebra there are four kinds of symbols: symbols of quantity, of operation, of relation and of abbreviation. Known quantities are represented by the first letters of the alphabet; or by the final letters with one or more accents, as x', y'', z'''. Besides letters of Greek and even of the Hebrew alphabet are employed. Thus M stands for «modulus» of any system of logarithms. π has been spoken of.

Of symbols of operation, multiplication may be indicated by placing a point between the factors when both are expressed by letters, as $a \,.\, b$. In a series multiplication between factors expressed even by numbers, may be expressed by a point between such factors. When $\sim$ is used between two quantities, it denotes difference, but not which quantity is to be subtracted from the other. Division has been sometimes indicated thus: $a \mid b$. The radical sign, $\sqrt{\ }$, when placed over a quantity indicates that its root is to be taken. Thus $\sqrt{a}$ denotes the square root of a. In the same manner $\sqrt[3]{a}$ and $\sqrt[n]{a}$ are read the *cube root* and the *nth root* of a, respectively. Here ^{3} and ^{n} give the *index* of the radical. A vinculum, ———, a bar |, brackets [ ], and parentheses ( ) all indicate that the quantities enclosed by them are to be regarded together as wholes. In algebra, Σ denotes that the algebraic sum of several quantities of the same nature as that to which the sign is prefixed is to be taken. The letter f, F and ϕ, written before any quantity, or quantities, separated by commas, as

$$F(x),\ f(x,y),\ \phi(x,y,z),\ \text{et cetera,}$$

denote quantities depending upon the quantities, or the quantity, within the parenthesis, without designating the nature of the relation. The signs of proportion, : :: :, when placed between quantities show them to be in proportion. R, r and ρ, and other symbols, denote *radii* of circles. L, l and λ may denote latitude. The leading letters of the Greek alphabet are also

sometimes used to denote known angles; and the final letters of the same alphabet to denote unknown angles. And when several quantities of the same kind are involved in an investigation, they may be designated by the same letter differently accented; thus: a' a'' a'''; a_1 a_2 and a_n. An older usage of o denotes an infinitely small quantity; and only sometimes absolute zero. Clearer thinking has impelled moderns to use ι (iota) or i for an infinitesimal, and to denote by o, *absolute zero,* and that only. The symbol ∞, first employed by Wallis in the 17th century, has long been used both for a *variable increasing without limit* and for *absolute infinity.* Taylor, in 1898, introduced the symbol $\aleph_0$, a contraction of % for an *infinite,* the reciprocal of an infinitesimal. The sign $\therefore$ denotes *then* or *therefore;* and the sign $\because$, *since* or *because.* The $y = f(x)$ is a general sign, indicating that there is a *general relation* between y and x — that is, y and x are so connected that x cannot change without y changing at the same time. The symbol $F(x, y, z,) = 0$ implies that there is a general relation between x, y and z, without specifying the relation. The symbols *sin, cos, tan, co-tan, sec, co-sec, ver-sin, co-ver-sin,* are abbreviations used, respectively, for the words "sine," "cosine," "tangent," "cotangent," "secant," "co-secant," "versed-sine" and "co-versed-sine." When the arc is supposed, as in trigonometry, to depend for its value upon any of the trigonometric lines, the function is called the inverse trigonometric function. The following symbols are used to denote this kind of a relation:

$$sin—^{1}y,\ cos—^{1}y,\ tan—^{1}y,\ cot—^{1}y,\ sec—^{1}y,\ co\text{-}sec—^{1}y,\ ver\text{-}sin—^{1}y,\ co\text{-}ver\text{-}sin—^{1}y.$$

These stand, respectively, for the arc whose sine, cosine, tangent, co-tangent, secant, co-secant, versed-sine and co-versed-sine, is y. The principle of notation has been extended to all inverse functions; thus:

$$\log {}^{1}y,\ d—^{1}(x\,d\,x), \text{ etc.}$$

These stand, respectively, for the quantity whose logarithm is y, and the quantity whose differential is $x\,d\,x$, etc. The differential of a function, or independent variable, is denoted by d, thus:

$$d(y^2) = 2ydy.$$

If we suppose the form of a function to vary, the symbol employed to denote the variable is δ, thus:

$$\delta u,\ \delta y,\ \delta x.$$

If both the form of the function and the independent variable of the function vary together, the resulting variation is denoted by the symbol D, thus:

$$D f(x,y) \ldots\ldots$$

The differential is the difference between two consecutive states of the quantity differentiated. If it is desired to represent the difference between two states of a function which are not consecutive, the symbol Δ is employed. Successive finite differences are represented by the symbols:

$$\Delta u,\ \Delta^2 u,\ \Delta^3 u,\ \Delta^4 u, \text{ etc.}$$

We have already spoken of Σ as used in algebra, where it denotes an algebraical sum. Its use in the calculus is principally restricted to the denotation of the *sum of the finite differences of a function.* The symbol $\int$ denotes an integration to be performed; while the symbol $\int_a^b$ is used to denote *a definite integral* taken between the limits a and b. The symbol $\Gamma(x+1)$ stands for the integral $\int e^{-v} v^{x-1} dv$. The vector sign is U. $\Gamma\beta$, in quaternions, should be read tensor of B.

In the foregoing list nearly all the symbols commonly employed by American mathematicians, have been enumerated; as well as some used abroad.

MATHEMATICAL SOCIETIES AND JOURNALS. The oldest of the sciences mathematics has always been cultivated and fostered, often with a degree of preferment over the later branches of the tree of knowledge, by the universities, the great academies and the other scientific bodies of a general scope throughout the civilized world. The indispensable condition for satisfactory progress facility of publication, has been provided for mathematicians in a very large degree by the 'Transactions' and 'Proceedings' of learned societies representing a wide scientific field. The specialist will usually prefer the mathematical journals proper, which indeed send out in a steady flow the finest product of the mathematical genius of the age. Theirs is the post of honor; it lies with them, by critical encouragement or repression, to maintain the standard of excellence of a great profession.

But there remains another set of functions, which are more and more efficiently performed by the mathematical societies. These include in their membership nearly every mathematician of standing in the four quarters of the globe. They provide a professional forum for the discussion of mathematical questions and of mathematical interests, and furnish the powerful stimulus of association and solidarity. Their activities cover a wide range, including the presentation and publication of papers and memoirs, the encouragement of bibliographic and encyclopedic undertakings, the organization of international congresses, special conferences and lectures, the exercise of a beneficial advisory influence on the mathematical curricula and equipment of the schools and universities, the diffusion of a better understanding of the science in the educated world, the formation of libraries, collections of models, and the promotion of agreeable social and personal relations among mathematicians.

The following list comprises the principal mathematical societies of the world, arranged in chronological order of foundation, with mention of their several publications:

1690. Mathematische Gesellschaft in Hamburg. Mitteilungen, 1881—.
1778. Wiskundig Genootschap te Amsterdam. Wiskundige Opgaven mit de Oplossingen, 1855—; Nieuw Archief voor Wiskunde, 1875—; Revue Semestrielle des Publications Mathématiques, 1892—.
1866. London Mathematical Society, Proceedings, 1865—.
1866. Moscow Mathematical Society, Transactions, 1869—.
1873. Société Mathématique de France, Bulletin, 1873—.
1883. Mathematical Society of Edinburgh, Proceedings, 1884—.
1884. Circolo Matematico di Palermo, Rendiconti, 1884—.
1886. Mathematical Society of Charkow, Bulletin, 1879.
1888. American Mathematical Society, Bulletin, 1891—; Transactions, 1900—; Mathematical Papers of the Chicago Congress, 1896; Colloquium Lectures on Mathematics, 1905, 1910, 1913, 1914.
1890. Deutsche Mathematiker-Vereinigung, Jahresbericht, 1892—.

895. British Mathematical Association, Mathematical Gazette, 1894—.
909. Indian Mathematical Society, Journal, 1909—.
909. Calcutta Mathematical Society, Bulletin, 1909—.
911. Sociedad Matematica Española, Revista, 1911—.
915. Mathematical Association of America, American Mathematical Monthly, 1894—.

A history of the Hamburg Society, prepared in connection with the celebration in 1890 of its 200th anniversary, may be found in volume II of the 'Mitteilungen.'

The 'Wiskundig Genootschap' renders an especially valuable service in the mathematical world by the publication of the 'Revue Semestrielle,' a condensed abstract of all the mathematical papers published in the various journals, constantly brought up to within a few months of the current date. The value to a productive mathematician of this great labor-saving device is quite inestimable.

The first president of the London Mathematical Society was the illustrious De Morgan, and the roll of members has included the names of Cayley, Sylvester, H. J. S. Smith, Clifford, Salmon, Stokes, Kelvin and most of the other eminent British mathematicians of the time. The secretary's office was efficiently filled for the long period of 34 years (1867–1901) by the late Robert Tucker. The 'Proceedings,' which is the leading British mathematical journal, has recently been enlarged in size. The membership of the society is about 300.

The Société Mathématique de France has about the same membership. The meetings are held twice a month at the Sorbonne. The president of the society for 1916 is M. Fouché, the secretaries are MM. Lévy and Montel. The council includes Appell, Borel, Jordan, Painlevé and Picard. The 'Bulletin' is issued quarterly.

The Deutsche Mathematiker-Vereinigung represents in full measure the fruitfulness and vigor of German mathematics. Its organization had been foreshadowed for many years, but was actually brought about in 1890 by the initiative of members of the mathematical-astronomical section of the older Society of German Natural Scientists and Physicians, in affiliation with which the Vereinigung still continues to hold its annual meetings. The appearance of the 'Jahresbericht,' whose volumes were originally issued in parts of book form, signalized the beginning of a series of invaluable reports on various branches of mathematics, beginning with the celebrated report by W. F. Meyer on 'The Present Status of the Theory of Invariants' (Vol. I, 1892). These reports and other undertakings of a bibliographical, critical and statistical character ultimately led to the plan of the 'Encyclopedia of Mathematics,' now in course of publication by Teubner, under the auspices of academies of science of Munich, Vienna and Göttingen. The Vereinigung has also played an active part in the organization of the international congresses of mathematicians, notably those of Zürich (1897) and Heidelberg (1904). It has interested itself effectively in the questions concerning the teaching of mathematics in the schools, universities and technical institutes, the training of teachers, the correlation of instruction in pure and applied mathematics and other matters of reorganization and progress in education, some of which are phases of an international reform movement. A history of the Vereinigung by the former secretary and present editor of the 'Jahresbericht,' Prof. A. Gutzmer of Jena, was issued on the occasion of the Heidelberg congress. The society has at present about 650 members. Meetings are held annually. It recently received from B. G. Teubner the gift of a complete set of his extensive mathematical publications as the nucleus of a library. The 'Jahresbericht,' now published monthly with occasional double bimonthly numbers, contains, beside the earlier reports mentioned above and a record of the society's activities, addresses, biographies and necrologies, original papers, criticisms, discussions and reviews and notes on current events. More extensive papers are published as separate volumes.

The American Mathematical Society was originally organized as the New York Mathematical Society in 1888 and was reorganized under its present national title in 1894. Sylvester's work at Baltimore (1877–84) and the influence of young mathematicians returning from study in Germany had produced a tidal movement of which the society has since its early days been the forefront and exemplar. Its membership, now about 740, includes practically every mathematician in the United States, and a considerable number of foreign representatives. The 'Bulletin,' published since 1891 in monthly numbers from October to July, is of the type later adopted by the 'Jahresbericht,' but contains also the official reports of the frequent meetings of the society, with abstracts of the papers presented and a complete bibliography of recent mathematical publications. Another special feature of the 'Bulletin' is the extensive «Notes» on current events in the mathematical world. The 'Transactions,' founded in 1900, is the official organ of the society for the publication of the more important papers read before it. The library of the society, now including 5,000 bound volumes, is deposited in the Columbia University Library.

Regular meetings are held four times a year in New York and twice a year in Chicago. Officers are elected at the annual meeting in December. A summer meeting is also held each year at some specially chosen place. At intervals of two or three years the summer meetings are reinforced by colloquia, or courses of lectures by specialists on recent advances in their particular lines of work. The rapid growth of mathematical interest in the Central and Western sections of the country have led to the organization of a Chicago Section (1898), a San Francisco Section (1902) and a Southwestern Section (1907). The sections meet once or twice each year.

The presidents of the society have been J. H. Van Amringe, 1888–90; Emory McClintock, 1890–94; G. W. Hill, 1894–96; Simon Newcomb, 1896–98; R. S. Woodward, 1898–1900; E. H. Moore, 1900–02; Thomas S. Fiske, 1902–04; W. F. Osgood, 1904–06; Henry S. White, 1906–08; Maxime Bocher, 1908–10; H. B. Fine, 1910–12; E. B. Van Vleck, 1912–14; E. W. Brown, 1914–16; L. E. Dickson, 1916–. The secretaries have been Thomas S. Fiske, 1888–95, and F. N. Cole, 1895–. The business of the society is transacted by a council composed of the officers, ex-presidents, editorial committee of the

'Transactions,' secretary of the Chicago Section and 12 other members elected for a term of three years.

While the society is more especially devoted to the advancement of the higher branches of mathematics, it exerts a considerable influence both directly and through its members on the teaching of the subject in the schools and universities. The report of a committee of the society on college entrance requirements in mathematics has been adopted by the College Entrance Examination Board. A report on the requirements for the master's degree, presented to the Chicago Section, has been favorably recognized by several of the Western universities. The society has also contributed materially to bring about the organization of associations of teachers of mathematics throughout the country, a movement especially stimulated by Professor Moore's presidential address in 1902.

Historical notices of the society may be found in the presidential addresses of Dr. McClintock ('Bulletin,' January 1895) and Professor Fiske (ib., February 1905). Other notices are scattered through the secretary's reports. The society, which has increased its membership by 50 per cent in the last 12 years, serves to-day to bring together in a harmonious whole all the mathematical activities of America. It is a centre not only of scientific activity but also of professional good feeling and agreeable personal relations.

The British Mathematical Association, formerly known as the Association for the Improvement of Geometrical Teaching, is devoted to improved instruction in elementary mathematics.

The Mathematical Association of America, organized in 1915 to represent the field of collegiate mathematics, has now over 1,100 members. It has adopted as its official organ the *American Mathematical Monthly*. The presidents of the Association have been E. R. Hedrick, 1915–17, and Florian Cajori, 1917–). The secretary-treasurer is W. D. Cairns. Meetings are held twice a year, usually in connection with those of the American Mathematical Society. Nine local societies have thus far been organized, holding meetings usually twice a year.

The international congresses of mathematicians have been mentioned above. While these are individually but temporary gatherings, they had come, before the war, to be an established institution of great and permanent value. Their sequence of time and place is: Paris, 1889; Chicago, 1893; Zürich, 1897; Paris, 1900; Heidelberg, 1904; Rome, 1908; Cambridge, 1912.

The exchanges of the American Mathematical Society include about 140 journals which regularly publish mathematical papers of appreciable value. In the notices appended to his collection of abbreviated titles of journals ('Jahresbericht der Deutschen Mathematiker-Vereinigung,' Vol. XII, 1903, pp. 426–444) Felix Müller sets the grand total ever published of all journals of a fairly mathematical complexion at about 1,200, of which over 600 now survive. More than 300 journals are cited in the references of the early numbers of the 'Encyclopedia of Mathematics.' The 'Revue Semestrielle' reports the contents of some 250 journals; the 'Fortschritte' list is about 170.

The oldest journals in Müller's list are the 'Philosophical Transactions' and the 'Journal des Savants,' both dating from the year 1665. Following these are the publications of the academies of Paris (1666) and Bologna (1690). From the 18th century there still survive, beside the journals of the academies (Berlin 1700; Petersburg, 1724; Göttingen, 1751; and others), also the 'Memorie di Matematica e di Fisica' (1782) of the Societá Italiana, the 'Bulletin' (1789) of the Sociétá Philomatique of Paris, and the 'Journal de l'Ecole Polytechnique' (1794). Among the extinct journals may be mentioned the 'Ladies' Diary' (1704), 'Gentlemen's Diary' (1741), these two uniting in the 'Lady's and Gentlemens Diary' (1841–71); the 'Cambridge Mathematical Journal' (1839–45), the forerunner of 'Sylvester's Quarterly Journal'; Gergonne's 'Annales de Mathématique' (1810–31); Tortolini's 'Annali' (1850–57), superseded by the present 'Annali di Mathematica'; and the various journals (1786–1825) of Hindenburg, Breithaupt, Bessel, Kretschmar. In America the ephemeral existences are chronicled of the 'Mathematical Correspondent' (1804–06), 'Adrain's Analyst' (1808), and 'Mathematical Diary' (1825–32), 'Mathematical Companion' (1828–31), 'Mathematical Miscellany' (1836–39), 'Cambridge Miscellany of Mathematics, Physics and Astronomy' (1842–43), 'Runkle's Mathematical Monthly' (1858–61). The publication of the 'Analyst' (1874–83) marked a substantial advance. Martin's 'Mathematical Visitor' (1877) and 'Mathematical Magazine' (1882), the 'Mathematical Magazine' (1882) and 'Mathematical Messenger' (1884) are extinct.

The following list gives the date of foundation, the title and the present place of publication of the strictly mathematical journals now in existence and not already cited in connection with the list of mathematical societies above:

1826. 'Crellès Journal für die reine und angewandte Mathematik,' Berlin.
1836. 'Liouville's Journal de Mathématiques pures et appliquées,' Paris.
1842. 'Nouvelles Annales de Mathématiques.'
1855. 'Quarterly Journal of Pure and Applied Mathematics,' London.
1858. 'Annali di Matematica pure ed applicata,' Milan.
1863. 'Giornale di Matematiche di Battaglini,' Naples.
1868. 'Mathematische Annalen,' Leipsic.
1870. 'Bulletin des Sciences Mathématiques,' Paris.
1871. 'Jahrbuch über die Fortschritte der Mathematik,' Berlin.
1872. 'Messenger of Mathematics,' London.
1878. 'American Journal of Mathematics,' Baltimore.
1881. 'Mathesis,' Ghent.
1882. 'Acta Mathematica,' Stockholm.
1884. 'Annals of Mathematics,' Cambridge, Mass.
1884. 'Bibliotheca Mathematica,' Leipsic.
1886. 'Periodico di Mathematica' (Supplemento 1898), Leghorn.
1890. 'Nyt Tidsskrift for Matematik,' Copenhagen.
1891. 'Revue de Mathématiques speciales,' Paris.
1894. 'American Mathematical Monthly,' Springfield, Mo.
1894. 'L'Intermédiaire des Mathématiciens,' Paris.
1895. 'Gazeta Matematica,' Bucharest.
1896. 'Il Pitagora,' Palermo.
1896. 'Revue de Mathématiques,' Turin.
1897. 'Wiadomosci Matematyczne,' Warsaw.
1898. 'Formulaire Mathématique,' Turin.
1898. 'L' Education Mathématique,' Paris.
1898. 'Bolletino di Bibliografia e Storia delle Scienze Matematiche,' Turin.
1899. 'L' Enseignment Mathématique,' Paris.
1900. 'Bolletino di Matematica,' Bologna.
1906. Sphinx Oedipe, Nancy.
1909. Mathematics Teacher, Syracuse, N. Y.
1912. Tohoku Mathematical Journal, Sondai, Japan.

MATHEMATICAL SOCIETY, The American. See AMERICAN MATHEMATICAL SOCIETY, THE.

MATHEMATICAL SOCIETY, The London, an association formed in the English capital in 1865 by a number of English professors of mathematics for the promotion of that science. It was incorporated in 1894. Since its formation it has regularly published 'Proceedings' and papers on mathematical subjects. It has an excellent library of scientific works. The Society meets monthly from November to June, the anniversary meeting being held in November.

MATHEMATICS. The science of mathematics — what shall it be said to be? A question much discussed by philosophers and mathematicians in the course of more than 2,000 years, and especially with deepened interest and insight in our own times. Many have been the answers, but none has approved itself as final. All of them, by nature belonging to the «literature of knowledge,» fall under its law and tend to «perish by supersession.» Naturally enough conception of the science has had to grow with the growth of the science itself. For it must not be inferred that mathematics, because it is so old, is dead. Old it is indeed, classic already in Euclid's day, being surpassed in point of antiquity by but one of the fine arts and by none of the «natural» sciences; but it is not only the oldest science, it is also as new as any, living and flourishing to-day as never before, advancing in a thousand directions by leaps and bounds. It is not merely as a giant tree throwing out and aloft myriad branching arms in the upper regions of clearer light and plunging deeper and deeper root in the darker soil beneath. Rather is it an immense forest of such oaks, which, however, literally grow into each other, so that, by the junction and intercrescence of limb with limb and root with root and trunk with trunk, the manifold wood becomes a single living organic growing whole. A vast complex of interpenetrating theories — such the science now actually is, but it is more wondrous still potentially, component theories continuing more and more to grow and multiply beyond all imagination and beyond the compass of any single genius, however gifted. What is this thing so marvelously vital? What does it undertake? What is its motive? How is it related to other modes and interests of the human spirit?

One of the oldest, at the same time the most familiar, of the definitions conceived mathematics to be the science of magnitude, where magnitude, including multitude as a special kind, signified whatever was «capable of increase and decrease and measurement.» Capability of measurement was the essential thing. That was a most natural definition of the science, for magnitude is a singularly fundamental notion, not only inviting but demanding consideration at every stage and turn of life. The necessity of finding out how many and how much was the mother of counting and measurement and mathematics, first from necessity and then from joy, so busied itself with these things that they came to seem its whole employment. But now the ordinary notion of measurement as the repeated application of a constant finite unit has been so refined and generalized, on the one hand through the creation of the so-called irrational and imaginary numbers (see ALGEBRA; COMPLEX VARIABLE), and on the other by use of a scale, as in non-Euclidean geometry (see NON-EUCLIDEAN GEOMETRY; ANALYTICAL METRICS), where the unit appears to suffer lawful change from step to step of its application, that to retain the old words and call mathematics the science of measurement seems quite inept as no longer telling either what the science has actually become or what its spirit is bent upon.

Moreover, the most striking measurements, as of the volume of a planet, the valency of atoms, the velocity of light or the distance of star from star, are not done by *direct* repeated application of a unit. They are all accomplished by indirection. Perception of this fact it was which led to the famous definition by the philosopher and mathematician, Auguste Comte, that mathematics is the «science of *indirect* measurement.» Here doubtless we are in presence of a finer insight and a larger view, but the thought is not yet either wide enough or deep enough.

For it is obvious that there is much admittedly mathematical activity that is not in the least concerned with measurement whether direct or indirect. In projective geometry (which see), for example, it was observed that *metric* considerations were either absent or subordinate. The fact, to take a simplest example, that the two points determine a line uniquely, or that the intersection of a sphere and a plane is a circle, is not a metric fact: it is not a fact about size or quantity or magnitude. In this field it was *position* rather than size that to some seemed the centre of interest, and so it was proposed to call mathematics the science of magnitude or measurement and position.

Even as thus expanded, the definition yet excludes many a mathematical realm of vast, nay, infinite extent. Consider, for example, that immense class of things known as *operations*. These are limitless alike in number and in kind. Now it so happens that there are systems of operations such that any two operations of a given system, if thought as following one another, together thus produce the same effect as some other single operation of the system. For an illustration, think of all possible straight motions in space. The operation of going from a point A to a point B, followed by the operation of going from B to a point C, is equivalent to the single operation of going from A to C. Thus the system of such operations is a closed system: combination of any two operations yields a third not without but within the system. Now the theory of such closed systems — called groups (see GROUPS) of operations — is a mathematical theory of colossal proportions. But it is obvious that an abstract operation, though a very real thing, is neither a position nor a magnitude.

This way of trying to come at an adequate conception of mathematics, viz., by attempting to characterize in succession its distinct domains, or varieties of content, or modes of activity, is not likely to prove successful. For it demands an exhaustive enumeration, not only of the fields now occupied by the science, but also of those destined to be conquered by

it in the future, and such an achievement would require a prevision that none may claim.

Fortunately there are other paths of approach that seem more promising. Every one has observed that mathematics, whatever it may be, possesses a certain mark, namely, a degree of certainty not found elsewhere. So it is, proverbially, the exact science par excellence. Exact, no doubt, but in what sense? To this an excellent answer is found in a definition of the science given about one generation ago by a distinguished American mathematician, Prof. Benjamin Pierce: mathematics is the science which draws necessary conclusions — a formulation of like significance with the fine *mot* by Prof. William Benjamin Smith, to wit: mathematics is the universal art apodictic. These statements, though neither of them may be entirely adequate, are, both of them, telling approximations, at once foreshadowing and neatly summarizing for popular use the conclusion reached by the creators of modern logic (see SYMBOLIC LOGIC), that mathematics is included in, and, in a profound sense, may be said to be identical with, symbolic logic. Observe that the emphasis falls on the equality of being "necessary," or logically *correct.* Naught is said about the conclusions being true. That is another matter for subsequent consideration.

But why are mathematical conclusions correct? Is it that the mathematician has a reasoning faculty essentially different in kind from that of other men? By no means. What, then, is the secret? Reflect that conclusion implies premises, that premises involve terms, that terms stand for ideas or concepts or notions, and that these latter are the ultimate material with which the spiritual architect, called the reason, designs and builds. Here, then, one may expect to find light. The apodictic quality of mathematical thought, the correctness of its conclusions, are due, not to any special mode of ratiocination, but to the character of the concepts with which it deals. What is that distinctive characteristic? The answer is: precision, sharpness, completeness of determination. But how comes the mathematician by such completeness? There is no mysterious trick involved: some ideas admit of such precision and completeness of determination, others do not; and the mathematician is one who deals with those that do. Law, says Blackstone, is a rule of action prescribed by the supreme power of a state commanding what is right and prohibiting what is wrong. But what are a state, and supreme power, and right and wrong? If all such terms admitted of complete determination as do, for example, such terms as triangle and circle, then the science of law would be a branch of pure mathematics. And such, too, to take another example, would be psychology, were consciousness, mind, perception, imagination, and all kindred terms, as completely determinable as the notion sphere. It will be asked, does not the lawyer sometimes arrive at correct conclusions? It may be admitted that he does sometimes, and so, too, of the psychologist or historian or sociologist. When this happens, however, when these students arrive, it is not meant at truth, for that may be by happy chance or by intuition, but when, strictly speaking, they arrive at conclusions that are correct, at conclusions, i.e., that follow logically from completely ascertained data or premises, then that is because they have been for the time acting in all literalness the part of mathematician. That is not to aggrandize the science of mathematics. Rather is it to credit to all serious thinking that, in any considerable garment of thought, one may find here and there, rarely enough sometimes, a mathetic fiber, woven in some perhaps exceptional moment of precise conception and rigorous reason. To think aright is no characteristic striving of a class of men. It is a common aspiration. Only, as before said, the stuff of thought is mostly intractable, formless, nebulous, like some milky way awaiting analysis into distinct star forms of completely determinate ideas.

The mentioned aspiration and the tendency of all thought, of all science, to assume the character of mathematics admit of many illustrations, which at the same time serve to show clearly the ultimate distinction between that thought which is mathematical and that which is not. One or two such illustrations must suffice.

There is no more common or more important scientific notion than that of function. The term is applied to either of two variable things (including constants conceived as special variables, whose variation is zero in amount) so related that to any value or state of either there corresponds one (or more) value (values) or state (states) of the other. Any two corresponding values or states are said to constitute a pair of values or states, and any two functionally related variables may be called a function-pair. Examples of such function-pairs abound on every hand, as the radius and the area of a circle; the corresponding values of x and y in an equation, $2x-3y+5=0$; elasticity of medium and velocity of sound or other undulation; the amount of sodium chloride formed and the time occupied by the reaction that generates it; the prosperity of a given community and, *ceteris paribus,* the intelligence of its patriotism. Indeed it may be that there is no thing which is not in some sense a function of every other. Be this as it may, one thing is very certain, namely, a very great part, if not the whole, of our thinking is primarily concerned with functional relationships, deals, that is, immediately or mediately, with pairs or systems of corresponding values or states or changes. Behold, for example, how the parallelistic psychology searches for correlations between psychical and physical phenomena. Witness, too, the sociologist seeking to determine a law of correspondence between the homogeneity of a population and its peacefulness; the anthropologist attempting to find a formula correlating mental power and brain-weight; the physicist's determinations of dependence between pressure and volume of a gas; and so on and so on. It is, then, here, in the immense and wondrously diversified domain of correspondence, the answering of value to value, of change to change, of condition to condition, of state to state, that the knowing activity, the intellect, finds its field.

What is it precisely that we seek to do by means of a correlation? The answer is: when one or more facts are given or known, to pass with absolute certainty to the correlative fact or

facts. For example, if $y = \sin x$, then, if a value be assigned to x or y, the corresponding value or values of y or x are determined by the equation, or definition, of the functional correspondence between the assemblage of values which x may take and the assemblage that y may assume. To effect the desired transition from the given or known to the dependent ungiven or unknown obviously requires one or more formulæ or equations which shall serve to define precisely the manner of correspondence, the law of dependence. Where do such defining formulæ or equations come from? Strictly speaking, they are never *found*, they are always *assumed*, assumed immediately or else mediately, that is, in the latter case, derived by assumed logical processes from such as belong to the former case. This statement is valid in every field of logical thought. In every field it is true that from nothing assumed nothing can be derived. Now, nothing is easier than to write down a perfectly definite formula that does not tell how cheerfulness depends on climate or retentiveness on interest or the volume of a cube on its dimensions. The mentioned inapplicability or "inutility" does not, however, at all tend to invalidate the formula regarded as defining a certain law of correlation. Indeed a given formula may be perfectly intelligible in itself; it, alone or joined with others in similar case, may state a perfectly intelligible law of correspondence, which, nevertheless, may have no validity whatever in the physical or in the sensuous universe. What is it, then, that guides in the choice of formulæ? For such determination or choice seems hardly referable to chance alone. The answer is that, broadly speaking, choice is determined by curiosity, and curiosity is itself not determined by choice, but is rather matter of native gift or predilection.

Just here we are in position where we have only to look steadily a little in order to perceive clearly the sharp and ultimate distinction between mathematics, on the one hand, and physical or other science, on the other. These are discriminated according to the kind of curiosity whence they spring. The mathematician is curious about definite abstract relationships, about logically possible modes of order, about varieties of abstract implications, about completely determined or determinable functional relationships considered merely in and of themselves, that is, without the slightest concern about the question whether or no they have external or sensuous or other sort of validity than that of being logically thinkable. It is the aggregate of logically thinkable relationships that constitutes the mathematician's universe, an infinitely infinite universe, worlds in worlds worlds in worlds of wonders, inconceivably richer in mathetic content than can be any greater world of sense. Immense indeed and marvelous is our own world of sense with its rolling seas and stellar fields and undulating air. But compared, one need not say with the entire world of mathesis, but only with the hyperspaces (see HYPERSPACES) explored by the geometrician, the whole vast region of the sensuous universe is literally as a merest point of light in a shining sky.

Now this mere speck of a physical universe, which the chemist, the physicist, the astronomer, the biologist, the sociologist, and the rest of nature students, find their great fields, may be, as it somewhat seems to be, a realm of invariant uniformities or laws; it may be a mechanically organic aggregate, connected into an order whole by a tissue of completely definable functional relationships; and it may not. In other words, it may be that the universe eternally has been and is a genuine cosmos, that the external sea of things immersing us, although it is ever changing infinitely, changes only lawfully, in accordance with a system of immutable laws, constituting an *invariant* (see INVARIANTS AND COVARIANTS) at once underived and indestructible and securing everlasting harmony through and through; and it may not be such. The student of nature assumes, he rightly assumes, that it is, and, moved and sustained by appropriate curiosity, he endeavors to find in the outer world what are the elements and relationships assumed to be valid there. "Natural science," said Bernhard Riemann, "is the attempt to comprehend nature by means of exact concepts." The mathematician, as such, does not make that assumption and does not seek for relationships in the outer world.

Is the assumption correct? Undoubtedly it is admissible, and as a working hypothesis it is undoubtedly very useful or even indispensable to the student of external nature; but is it true? The mathematician, as man, does not know although he greatly cares. Man, as mathematician, neither knows nor cares. The mathematician does know, however, that, if the assumption be correct, every relationship that is valid in nature is, *in abstractu*, an element in his domain, a subject for his study. He knows, too, at least he strongly suspects, that, if the assumption be not correct, his domain remains the same absolutely. The two realms, of mathematics, of natural science, like the two attitudes, the mathematician's and that of the nature student, are fundamentally distinct and disparate. To think logically the logically thinkable — that is the mathematician's aim. To assume that nature is thus thinkable, an embodied rational logos, and to discover the thought supposed incarnate there — these are at once the principle and the hope of the student of nature.

Suppose the latter student is right, suppose the outer universe really is an embodied logos of reason, an infinitely intricate garment ever weaving and ever woven, warp and weft, of logically determinate relationships, does that imply that all of the logically thinkable is incorporated in it? It seems not. A cosmos, a harmoniously ordered universe, one that through and through is self-compatible, can hardly be the whole of reason materialized and objectified. There appears to be many a rational logos. At any rate the mathematician has delight in the construction and contemplation of divers systems that are inconsistent with one another, though each is composed of consistent relationships. He constructs in thought, as witness the geometry of hyperspaces, ordered worlds, worlds that are possible and logically actual, and he is content not to know if any of them be otherwise actual or actualized. There is, for example, a Euclidean geometry and there are infinitely many kinds of non-Euclidean (see NON-EUCLIDEAN GEOMETRY). These theories

regarded as "applied" mathematics, regarded, that is, as *true* descriptions of some one actual space, are incompatible. In our universe, to be specific, if it be, as Plato thought and nature science takes for granted, a geometrized or geometrizable affair, then one of these geometries may be objectively valid in it. But in the vaster world of thought, in the world of pure mathesis, all of them are valid; there they coexist, and interlace among themselves and others as differing strains of a hypercosmic harmony.

A geometry, indeed any mathematical theory, consists of a definite system of determinate compatible principles or assumptions or hypotheses or postulates (commonly called axioms) together with their implications, their logically deducible consequences. Accordingly, natural science, the term being broadly employed to signify knowledge that is ultimately dependent upon "observation and experiment," cannot be or become strictly mathematical. It aspires to the *character,* and approximates and imitates the *form,* of mathematics, but it can never really attain either. Mathematics is concerned with implications, not applications. Such terms as "applied mathematics," "mathematical physics," and the like, are indeed in common use, but the signification, rightly understood, is always that of a mixed doctrine, a doctrine that is thoroughly analyzable into two disparate parts: one of these consists of determinate concepts formally combined in accordance with the established canons of ratiocination, i.e., it is pure mathematics and not natural science; the other is matter of observation and experiment, i.e., it is natural science and not mathematics. No fibre of either component is a filament of the other. Whether the behavior of natural phenomena is or is not exactly descriptible by mathematical formulæ can never be ascertained, for the means to "natural knowledge," viz., observation and experiment, are fallible by nature, and, however refined or prolonged, are incapable of yielding absolute exactness or certainty. Of any so-called law of nature, "the most, the last, the best that can be said" is that its agreement with the facts is so nearly perfect that every discrepance, if any there be, has escaped detection.

Cannot the like be said of mathematics? In the foregoing conception of mathematics it has indeed been tactily assumed that some ideas are completely determinable, that there are possible systems of postulates absolutely free alike from obscurity and from interior contradiction, that the postulates of such a system import a perfectly definite body of ascertainable implications, and that there is a perfect standard of logic quite independent of time and place and of the defects and idiosyncrasies of individual reasoners. May not these assumptions, some or all of them, be incorrect? There are some grounds, historical and biological, for suspecting that such may be the case. Such an admission, however, whether tentative or unconditioned, has by no means the effect of undefining mathematics or of dethroning the science from its commanding position among the knowledges. It would indeed leave man without the possession, even without the hope, of *absolute* knowledge, but, among all the forms of actual or potential proximate knowledge, mathematics would still rightly rank as highes It would indeed be marked by a degree of u certainty or indeterminateness or relativity inexactness, viz., that degree of inexactne which by supposition would belong to *all* mea ings and standards. Hence it would not peculiar to mathematics, but would be comm to it and every other science. But every su "other science" has an *additional* mark of i determinateness, the characteristic inexactne of all possible observation and experiment. any case, then, the observational and exper mental sciences are, in respect to certainty a exactness, hopelessly inferior to mathematics.

But in all ages it has been the faith of t mathematician that complete determination concepts and absolute rigor of demonstrati are in fact attainable, not, however, in t realm of observation and experiment, but the world of pure thought. It is, then, in th world, where all *entia* dwell, where is eve type of order and every manner of correlati and every variety of relationship and eve form of implication, it is in this infinite e semble of eternal verities whence, if there one cosmos or many of them, each derives character and mode of being,— it is there th the spirit of mathesis has its home and its lif

Is it a restricted home, a narrow life, stat and cold and gray with logic, without artist interest, devoid of emotion and mood a sentiment?

That world, it is true, is not a world of sol light, it is not clad in the colors that glori the things of sense, but it is an illuminat world, and over it all and everywhere throug out are hues and tints transcending sens painted there by radiant pencils of psych light, the radiance in which it lies.

It is a silent world. Nevertheless, in respe to the highest principle of art — the inte penetration of content and form, the perfe fusion of mode and meaning — it even riva music.

In a sense, it is a static world, like those the sculptor and the architect. The figure however, which reason constructs and t mathetic vision beholds, transcend the temp and the statue, alike in simplicity and in i tricacy, in delicacy and in grace, in symmet and in poise.

Not only are this home and this life, th rich in æsthetic interests, really controlled a sustained by motives of a sublimed and supe sensuous art, but the religious aspiration, to finds there, especially in the beautiful doctri of invariants, the most perfect symbols of wh it seeks — the changeless in the midst of chang abiding things in a world of flux, configuratio that remain the same despite the swirl and stre of countless hosts of curious transformation

Literature.— The literature having for object the exposition of the nature and pri ciples of mathematics is extensive. By f the most important recent contribution, whi at the same time serves to introduce the read to the chief memoirs in the field, is B. Russell 'The Principles of Mathematics,' Vol. I. F an excellent critical review of the princip modern attempts to define mathematics, t reader may be referred to Prof. M. Böche 'The Fundamental Conceptions and Metho of Mathematics' ('Bull. of the American Mat Soc.,' Vol. XI). Consult also Whitehea

A. N., and Russell, B. A. W., 'Principia Mathematica' (Cambridge 1910–); Whitehead, A. N., 'Introduction to Mathematics' (Home University Library).

CASSIUS J. KEYSER,
Adrain Professor Emeritus of Mathematics, Columbia University.

MATHER, măt'h'ĕr, Cotton, American colonial clergyman, son of Increase Mather (q.v.): b. Boston, 12 Feb. 1663; d. there, 13 Feb. 1728. He entered Harvard College at 11, and at his graduation in 1678 President Oakes expressed his expectation that he would resemble his venerable grandfathers, John Cotton and Richard Mather, who should be united and flourish again in him. He was early distinguished for piety, and in his 14th year began a system of rigid and regular fasting and vigils which he continued through life. He was occupied after leaving college with teaching, in 1680 became the assistant of his father in the pastorate of the North Church, Boston, and in 1684 was ordained as his colleague. When, at the report of the landing of the Prince of Orange in England, Governor Andros was seized and imprisoned in Boston, Cotton Mather prepared the public declaration justifying the measure. But it is in connection with proceedings concerning witchcraft that he is most generally known. In 1685 he published his 'Memorable Providences relating to Witchcraft and Possessions,' narrating cases which had occurred at intervals in different parts of the country; and during the witchcraft excitement in Salem in 1692 was a prejudiced investigator in the matter, publishing the next year his 'Wonders of the Invisible World,' in order to confirm believers in that kind of demoniac possession. In 1702 appeared his greatest work, 'Magnalia Christi Americana,' an ecclesiastical history of New England concerning which he was admitted to know more particulars than any other man. Though strongly marked by its partialities and prejudices, its somewhat quaint and grotesque character, its admixture of superstition, learning and ingenuity, make it still interesting. In 1713 his 'Curiosa Americana' was read before the Royal Society of London, and he was elected a member of that body, being the first American to receive this distinction. In its 'Transactions' in 1721 appeared an account of the practice of inoculation for the smallpox, introduced by Lady Mary Wortley Montagu; and it was by the efforts of Mather in connection with Dr. Boylston, against both professional and popular prejudice, that the operation was first performed in Boston. His 'Essays to Do Good' (1710) was admitted by Dr. Franklin to have influenced some of the principal events of his life; and his 'Christian Philosopher' and 'Directions for a Candidate of the Ministry' enjoyed high repute. His 'Parentator' (1724) is a life of his father, Increase. Vain and pedantic as he was and narrow and credulous as he showed himself to be in regard to witchcraft and other topics of his time, he was in many directions a useful, public-spirited citizen who deserves to be regarded more leniently by posterity than has sometimes been the case. Consult 'Life' by Samuel Mather (Boston 1729); Bond, Enoch, 'The Mather Family' (ib. 1844); Garvin, A. B., 'Life and Times of Cotton Mather' (ib. 1892); Wendell, Barrett, 'Cotton Mather' (1891); Tyler, 'History of American Literature' (Vol. II, New York 1881).

MATHER, Frank Jewett, Jr., American professor of art: b. Deep River, Conn., 6 July 1868. In 1889 he was graduated at Williams College, and subsequently studied at Johns Hopkins (Ph.D. 1892), the University of Berlin and L'École des Hautes Études, Paris. From 1893 to 1900 Dr. Mather was instructor and assistant professor of English and Romance languages at Williams College; was editorial writer on the New York *Evening Post*, assistant editor of *The Nation* in 1901–06; art critic of the *Evening Post* in 1905–06 and again in 1910–11 and American editor of the *Burlington Magazine* in 1904–06. In 1910 Dr. Mather became Marquand professor of art and archæology at Princeton University. He is the author of 'Homer Martin, Poet in Landscape' (1912); 'The Collectors,' short stories (1912); 'Estimates in Art' (1916), 'The Portraits of Dante' (1921); 'A History of Italian Painting' (1923). 'Modern Painting' (1927), also several monographs. He is a contributor to various periodicals. In 1917 he served as chief boatswain's mate in the United States Naval Reserve Fleet.

MATHER, Increase, American colonial divine, son of Richard Mather (q.v.): b. Dorchester, Mass., 21 June 1639; d. Boston, 23 Aug. 1723. He was graduated at Harvard College in 1656, and in 1658 at Trinity College, Dublin. He afterward preached in Devonshire and the island of Guernsey, and on the Restoration was urged to conform and settle in England; but he refused, and on his return to Boston was invited to preach to the North Church, of which he was ordained pastor in 1661. This office he held for 62 years. He was a member of the synod of 1679, and drew up the propositions which were adopted concerning the proper subjects of baptism. In 1681 he was elected president of Harvard College, but the reluctance of his church to relinquish him induced him to decline the position. In 1684 the office was again offered him, and he accepted it with a stipulation that he should retain his relation to his people. He continued in this station till 1701, when he retired in consequence of an act of the general court requiring the president to reside in Cambridge. He received the first diploma for the degree of D.D. that was granted in America. When in 1683 Charles II demanded that the charter of Massachusetts should be resigned into his hands, Mather was foremost in opposing the measure; and when that monarch annulled the charter in 1685, he was sent to England as agent for the colonies. He was in England during the revolution of 1688, and, having found it impossible to obtain a restoration of the old charter, accepted a new one, under which the appointment to all the offices reserved to the Crown was confided to him. He returned in 1692, when the general court appointed a day of thanksgiving for his safety and for the settlement of the dispute. He is stated to have condemned the violent proceedings which followed relating to witchcraft. He was accustomed to spend 16 hours every day in his study, and always committed his sermons to memory. One-tenth part of all his income was devoted to purposes of charity. He was the author of 92 distinct publications. His 'Remarkable

Providences' was republished in the 'Library of Old Authors' (1856), and other works by him are 'A Brief History of the War with the Indians in New England' (1676); 'Relation of Troubles of New England from the Indians' (1677; 1864); 'Cases of Conscience Concerning Witchcraft' (1693; 1862); 'Cometographia, or a Discourse Concerning Comets' (1683). Consult Pond, Enoch, 'The Mather Family' (Boston 1844); Walker, Williston, 'Ten New England Leaders' (New York 1901); Tyler, M. C., 'History of American Literature' (Vol. II, New York 1881); Sibley, 'Harvard Graduates' (Vol. I, Cambridge 1873).

MATHER, Richard, American colonial divine: b. Lowton, Lancashire, England, 1596; d. Dorchester, Mass., 22 April 1669. He became a schoolmaster at Toxteth Park, near Liverpool, at the age of 15; studied at Brazenose College, Oxford, in 1618; was ordained in the English Church soon after, and became the minister of Toxteth, in which position he remained 15 years. He was suspended for non-conformity to the ceremonies of the Established Church in 1633, and though soon restored by the influence of friends was again silenced in the following year. He therefore decided to emigrate to New England, arriving in Boston in August 1635. The next year he became pastor of the church in Dorchester, and held that position till his death. He was one of the compilers of the 'Bay Psalm Books' and assisted to frame in 1648 a model of discipline known as the Cambridge Platform. He married for his second wife the widow of John Cotton (q.v.). His 'Journal, Life and Death' was issued by the Dorchester Historical Society in 1850. See CONGREGATIONALISM and consult Mather, Increase, 'Life and Death of Richard Mather' (Cambridge 1670); Tyler, M. C., 'History of American Literature' (Vol. II, New York 1881).

MATHER, Robert, American lawyer and railroad official: b. Salt Lake City, 1859; d. 1911. In 1882 he was graduated at Knox College, Illinois, and four years later was admitted to the bar at Chicago. He practised in that city in 1886–89; was local attorney in 1889–94, assistant general and general attorney in 1894–1902, and general counsel in 1902–09 of the Chicago, Rock Island and Pacific Railroad. In 1909 he was elected chairman of the board of the Westinghouse Electric Company. Mr. Mather was interested, as officer or director, in several railroad and industrial companies.

MATHER, William Williams, American geologist: b. Brooklyn, Conn., 24 May 1804; d. Columbus, Ohio, 26 Feb. 1859. He was graduated from West Point in 1828 and was an assistant professor of chemistry and geology there, 1829–35. After a short period spent as professor of chemistry at the University of Louisiana (1836), he undertook the superintendence of a geological survey of the 1st district of New York State which included the Hudson River counties, a labor which lasted from 1836 to 1844. He was also State geologist of Ohio 1837–40, and of Kentucky 1838–39, and from 1842–45, and 1847–50, professor of natural science in the Ohio University at Athens. He made a collection of about 22,000 mineralogical specimens. He contributed frequently to scientific journals, edited the *Western Agriculturist* for a time and published 'Geology of the 1st Geological District' (in 'Natural History o New York,' 1843); and 'Elements of Geology.

MATHESON, măth'ĕ-sŏn, **Arthur James** Canadian statesman: b. Perth, Ontario, 1842 d. 1913. He received his education at Uppe Canada College and Trinity College, Toronto was called to the bar in 1870 and established practice in his native town of which he wa mayor in 1883–84. From 1894 to 1913 he was member of the Conservative party in the On tario legislature and served as provincial treas urer in 1905–13 under Premier Sir James I Whitney. In 1906 he was a member of th Ottawa Inter-provincial Conference and in th following year of the National Conference o Taxation. In 1910 he served as vice-presider of the International Commission. Mr. Mathe son was made K.C. in 1908. He served in th militia after 1866, saw service during th Fenian raids and in 1900 attained the rank o brigadier-general.

MATHESON, George, Scottish Pres byterian clergyman: b. Glasgow, 27 Marc 1842; d. 28 Aug. 1906. He was educated a Glasgow University and although he ha lost his sight in boyhood he entered the ministr of the Kirk of Scotland and was ordained i 1868. He was minister of Innellan on the Firt of Clyde 1868–86; and of Saint Bernard's Pa ish, Edinburgh (1886–97). He was the autho of the famous hymn, 'O Love that Will No Let Me Go,' which finds a place in near every modern hymnal. Among his many pul lished books are 'Aids to the Study of Germa Theology' (1874); 'Natural Elements of Re vealed Theology' (1881); 'The Psalmist an the Scientist' (1887); 'Sidelights from Patmos (1897); 'The Sceptre Without a Sword' (1901) 'Representative Men of the Bible' (thre series); and 'Representative Women of th Bible' (1907).

MATHESON, Samuel Pritchard, Can dian clergyman: b. Manitoba (then the Re River Settlement), 20 Sept. 1852. He receive his education at Saint Johns' College School an Saint John's College, Winnipeg. He receive deacon's orders in the Anglican Church in 187 and those of priest in 1876. He became ma ter at Saint John's College School; subsequent served as professor of exegetical theology Saint John's College, canon and dean of Sai John's Cathedral, deputy headmaster and head master of Saint John's College School. Subs quently he was warden and chancellor of Sai John's College. He became secretary of th Provincial Synod of Rupert's Land and pro locutor of same and in 1902 became prolocuto of the General Synod of Canada. In 1903 h became coadjutor bishop of Rupert's Land, i 1905 he became archbishop and from 1909–3 was Primate of all Canada. D. 19 May 1942.

MATHEW, Theobald, known as "FATHE MATHEW," Irish temperance reformer: Thomastown Castle, County Tipperary, Irelan 10 Oct. 1790; d. Queenstown, Ireland, 8 De 1856. He was educated at Maynooth Colleg and the Capuchin Convent, Cork, and was or dained to the Roman Catholic priesthood i 1814. In 1838 he inaugurated a temperanc crusade and his labors in Great Britain an Ireland induced hundreds of thousands to sig the total abstinence pledge. The most co clusive evidence of the benefit of his preachi

yas the reduction of nearly £600,000 on the luties of spirits imported in Ireland in five ears. He made a tour of the United States in 849–51 and was very successful. Though pen-ioned by the Queen he was never entirely re-ieved from the burden of debt with which his xtended tours had burdened him, and which aused his imprisonment for a time in 1847. Consult *Life* by J. F. Maguire (London 863; abridged ed., 1890); Matthew F., *Father Mathew: His Life and Times* (London 1890); Tynan, K., *Father Mathew* (ib. 1908).

MATHEWS, măth'ūz, **Abert,** «Paul Siegvolk,» American lawyer and author: b. New York, 8 Sept. 1820; d. there, October 1903. He vas graduated from Yale in 1842 and after tudying law was admitted to the New York ar in 1845. He soon acquired an extensive ractice and was especially skilled in chancery ractice. He found time for literary work de-pite the claims of his profession, and under he pseudonym «Paul Siegvolk» published *Valter Ashwood,* a once popular love story 1860); *A Bundle of Papers* (1879); *Thoughts n Codification of the Common Law* (1881); *Juminations: The Ideal American Lady and Other Essays* (1892); *A Few Verses* (1893), tc. In the early part of his career he was a lose friend of N. P. Willis, whom he aided n establishing *The Home Journal.*

MATHEWS, Charles, English actor: b. ondon, 28 June 1776; d. Plymouth, England, 8 June 1835. He made his debut as an actor n Richmond in 1793 and was subsequently en-aged for some years in Dublin and London. n 1818 he made a hit as a professional enter-iner in his *At Home.* He continued in this lass of work, making two successful trips to ne United States and, returning, presented in ngland with great success *A Trip to Amer-a.* In 1828 he became joint proprietor of the delphi Theatre, London. Consult Baker, *Our ld Actors* (London 1881); Mrs. Mathews, *Memoirs of Charles Mathews, Comedian* (Lon-on 1839).

MATHEWS, Charles James, English ctor: b. Liverpool, 26 Dec. 1803; d. Manches-er, England, 24 June 1878. He was the son of harles Mathews (q.v.) and was educated as n architect, but abandoned that calling for the tage. As a light comedian he was very suc-essful, but his attempts at managing Covent arden and the Lyceum Theatre in London were ailures. He made several trips to the United tates, Paris and Australia, presenting an en-rtainment similar to his father's famous *At Home.* Consult Dickens, Charles, *Life of Charles James Mathews* (London 1879).

MATHEWS, Edward Bennett, American eologist: b. Portland, Me., 16 Aug. 1869. In 891 he was graduated at Colby College and in 894 received the degree of D.Ph. at the Uni-ersity of Johns Hopkins. In 1891–94 he was eld assistant of the United States Geological urvey; in 1894–95 was instructor in mineral-gy and petrography, in 1895–99 associate, in 899–1904 associate professor and in 1904 pro-essor of geology at Johns Hopkins. After 917, he served as chairman of the geolog-al department. From 1898 to 1917 Dr. Math-ws was assistant state geologist of Maryland nd subsequently was state geologist. He pub-lished *Bibliography and Cartography of Maryland* (1897); *Maps and Map-Makers of Maryland* (1898); *Building Stones of Maryland* (1898); *Limestones of Maryland* (1910); *History of the Mason-Dixon Line; Physical Features of Maryland; Water Resources of Maryland,* and numerous geological papers. Died Baltimore, Md., 4 Feb. 1944.

MATHEWS, Ferdinand Schuyler, American artist and author: b. New Brighton, N.Y., 30 May 1854; d. 20 Aug. 1938. He contributed extensively to the magazines both as illustrator and writer and published *The Writing Table of the 20th Century* (1900); *The Field-Book of American Wild Flowers* (1902); *Field-Book of Wild Birds and Their Music* (1904); *Field-Book of American Trees and Shrubs* (1915); *Wild Flowers for Young People* (1923).

MATHEWS, Joseph Howard, American chemist: b. Auroraville, Wis., 15 Oct. 1881. He was graduated from the University of Wisconsin in 1903, and took his Ph.D. at Harvard in 1906. In 1906–07 he was an instructor in chemistry at the Case School of Applied Science, Cleveland, Ohio. In 1911 he joined the faculty of the University of Wisconsin as assistant professor of chemistry. He was made associate professor in 1917, and professor in 1919, also chairman of the department. He served in the Ordnance Department of the United States Army during the First World War.

MATHEWS, Shailer, American educator and editor: b. Portland, Me., 26 May 1863; d. Chicago, Ill., 23 Oct. 1941. After being graduated from Colby College in 1884 and from Newton Theological Institution in 1887, he studied at the University of Berlin, 1890–91. He taught rhetoric and thereafter history and political economy, at Colby College, 1889–94; and in the latter year joined the faculty of the Divinity School of the University of Chicago, where he was professor of history and comparative theology, 1906–33, junior dean, 1899–1908, and dean, 1908, until he retired as emeritus in 1933. Honorary degrees were conferred on him by Colby, Pennsylvania, and Oberlin colleges, and by Brown, and Miami universities, the University of Glasgow, Faculté Libre de Theologie Protestante de Paris, the Chicago Theological Seminary, and the University of Rochester. Dr. Mathews was president of the Federal Council of the Churches of Christ in America, 1912–16; of the Northern Baptist Convention, 1915; of the Chicago Church Federation, 1929–32; and of Kobe College Corporation after 1920. He was also a trustee of the Church Peace Union, founded by Andrew Carnegie, after 1914; and was active in numerous other organizations. He delivered the Haverford Library lectures in 1907; the Earle lecture at Berkeley, Calif., in 1913; the William Belden Noble lectures at Harvard in 1916; the McNair lectures at the University of North Carolina in 1918; the Slocum-Bennett lectures at Wesleyan University in 1921; the Cole lectures at Vanderbilt University in 1926 and 1934; and the Barrows lectures in India, University of Chicago, 1933–34. He edited *World To-day* from 1903–11, and *The Biblical World,* 1913–20. He was also the editor of New Testament handbooks, *The Bible for Home and School, Social Betterment,* handbooks of ethics and religion, Women Citizen's Library and associate editor of the *Dictionary*

of the Bible, American Journal of Theology, Constructive Quarterly.

MATICO, mȧ-tē′kō, a shrub (*Piper angustifolium*), of the tropical family Piperaceae, native of Peru; remarkable for the styptic property of its leaves and unripe fruit.

MATIN, măt′ĭn, a large houndlike French dog, resembling the great Dane, but having a rough coat. The head is elongated, the forehead flat, the ears pendulous toward the tips; color, yellowish-fawn or whitish.

MATINS, the daily office of morning prayer in the Anglican communion. It is composed in part of the pre-Reformation offices of Matins and Lauds. In the Roman Catholic Church, it is the first part of the Divine Office, with which Lauds are usually associated. On Sundays and double feasts Matins have three nocturns; on simple feasts and weekdays, one nocturn. Easter and Pentecost have each only one nocturn, with three psalms. After private prayer versicles and responses are recited; the invitatory psalm follows.

MATISSE, mȧ-tēs′, **Henri,** French artist: b. Le Cateau (Nord), Dec. 31, 1869. The son of a grain merchant, after graduating from the lycée he studied law for a year at the University of Paris, then obtained a place in a law office at St. Quentin. While convalescing from an illness he enrolled in an art school for textile workers. On regaining health he determined, against parental wishes, to make art his career and in 1892 entered the Ecole des Beaux-Arts. After studying under the conservatives, Adolphe Bouguereau and Gabriel Ferrier, he studied in the class of Gustave Moreau. In 1893 he exhibited at the exposition of the Société Nationale des Beaux-Arts and one of his paintings was bought by the French government. For four years he was Moreau's pupil. In 1897 he married Noëllie Parayre of Toulouse who bore him two sons and a daughter. A fine draftsman, for a decade after arriving in Paris he supported himself mainly by copying old masters at the Louvre for provincial museums and private buyers. Revolting against academism, the classical tradition in which he was adept as a copyist, he strove for an individual manner of expression. His *La Desserte* (1897) reveals impressionist leanings. Strongly influenced both by Oriental art and modernism, his work was shown in all the exhibitions at the Salon des Indépendants. He was the leader of the group of modernists stigmatized in 1905 as "Les Fauves" (Wild Beasts) because of their "willful eccentricity." From 1906 he began to obtain wider recognition, and for a brief period he was regarded as foremost among the modernists, until Picasso supplanted him. His paintings appeared in the first Post-Impressionist Exhibition at London (1910–1911), also in the second (1912). In 1913 his work began to show Cubist influences but in the last years of World War I he reverted to his earlier manner of bold flat patterning. In 1920 he designed the scenery and costumes for Diaghilev's production of *Le Chant du Rossignol.* The Luxembourg bought one of his famous *Odalisque* series in 1920 and in 1927 he was awarded first prize at the Carnegie International Exhibition for his *Fruit and Flowers.* His subjects are generally young women, clothed nude or semi-nude, and occasional landscapes and still lifes. Regarded by many connoisseurs as the foremost painter of the day, he is also noted for his sculptures and graphic art work in etching, drypoint, lithography, and drawing.

MATO GROSSO, mȧ′tōō grō′sōō (formerly Matto Grosso), state, Brazil, bordering on the countries of Bolivia and Paraguay. It is the second largest state of Brazil, exceeded only by Amazonas. Its capital city is Cuiabá. Other major cities are Campo Grande and Corumbá.

Mineral resources in the state are large and unexploited. The chief occupation is stock raising, but some of the larger cities raise rice, beans, tobacco, sugar, and maté.

Navigable rivers are the São Lourenço, Cuiabá, Paraná, and Paraguay. The São Paulo-Corumbá Railroad crosses Mato Grosso from east to west.

Mato Grosso, city in the northwestern part of the state of the same name, is located on the Guaporé River, 250 miles northwest of Cuiabá. In the 18th century it was an important city with a population of about 20,000. Pop. (1950) 470.

MATRIARCHATE mā′trĭ-är-kāt, or **MATRIARCHY,** a family, group, or state in certain primitive societies ruled by a woman. In matriarchies descent is traced in the female line.

MATRIMONY VINE. See Lycium.

MATRONALIA, măt-rō-nā′lĭ-ȧ, the 1st of March, the New Year's day of the Roman religious calendar, sacred to Juno, the deity of matrons. On this festival day wives expected presents from their husbands, and themselves gave an entertainment to the household slaves.

MATSUDAIRA, mä-tsŏŏ-dī-rä, the generic name of 52 families of territorial nobles in feudal Japan, mostly, although not all, descended from an ancestor Minamoto Chikauji of the 14th century, 11th in generation from Yoshiie who, in the village of Matsudaira, in Mikawa, espoused the daughter of Matsudaira Nobushige and took his wife's name. When, in Yedo in 1603, the Tokugawa line of shoguns was established, permission was given to the heads of allied or loyal clans to bear his name. Among the hundreds of feudal barons and others thus favored were many of the most illustrious in the period 1603–1867. After the latter date the name, with the privilege of bearing the ancestral coat of arms, was restricted to 27 families. Their heraldic crest consists of three mallow leaves within a circle. With the exception of Fujisan, this is the most characteristic decoration seen on the older Japanese art products. It is said to have been selected by Ieyasu when three cakes, laid over as many mallow leaves, on a plate, were presented for the conqueror's refreshment by a loyal vassal.

MATSUDAIRA SHUNGAKU, mä-tsŏŏ-dī-rä shŏŏn-gä-kŭ, champion, during Japan's hermit days, of Western civilization and of friendship with the United States: b. Yedo, Oct. 11, 1828; d. Tokyo, 1880. Adopted at 10 years of age by Matsudaira, baron of Echizen, at 21 he began sweeping and con-

tructive reforms, introducing modern military, conomic and hygienic methods, abolishing rchery in favor of fire arms, establishing can- on and rifle factories, sending young men as tudents to the Dutch at Nagasaki, establish- ng lectures on the Oyoméi (q.v.) philosophy nd writing manifestoes. He combatted popu- ar prejudices, showed the superiority of Western civilization and the reasonableness of Christianity, compelled the use by doctors of he Western methods of medical practice, pened a dispensary and organized a foreign terature department in the excellent clan chool in Fukui. Opposed to opening the coun- ry prematurely, on unequal terms, as was done y Ii Naosuké, he suffered domiciliary confine- nent but was later called to be virtual premier f the empire. With the assistance of Yokoi Héishiro he abolished the century-old custom f compelling the feudal barons to live half the ear in Yedo, leaving their families as hostages hen away. This made Kioto the centre of ffairs. He later brought the first of the yatio n his domain, and here the first public schools eyond the treaty ports were organized, and ne of the very first of the new regiments of ie peasant national army was raised. Out of is region, chiefly, was raised the famous Ninth ivision that took Port Arthur. High posthum- us honors were awarded this pioneer of Western civilization. His biography and writ- gs have been compiled by his son the marquis. onsult Griffis, 'The Mikado: Institution and erson' (1915), and 'The Mikado's Empire' 1912).

MATSUKATA, Masayoshi, Prince, Jap- ese statesman: b. Satsuma 1835; d. Tokio, July 1924. He was son of a Samurai, it fell in with the Radical party; was made ead of the prefecture (or *ken*) of Hida ter the revolution; was prominent in the tax form of 1875; represented Japan in several dustrial exhibitions; was a member of the abinet, in 1880 as Minister of Commerce, in 81 as Minister of Finance, and, with the same rtfolio, as Prime Minister from 1891 to 1893. is great work was in 1896–97, when he formed new cabinet, carried through the gold stand- d, set Japanese credit on its feet, but he as forced to retire because of the ill-success his scheme of taxation. He was Minister Finance a second time in 1898–1900, became ivy Councillor in 1903, and received the title marquis in 1906. He was also president of Japanese section of the Red Cross.

MATSUMOTO, Japan, town, in the dis- t of Nagano, in the island of Hondo, 100 les north by west of Tokio. The town manu- tures baskets, preserved fruits and silks and s an old daimyo castle. Pop. 63,427.

MATSUMURA, Jinzo, Japanese botanist: Ibaraki-Ken, 1856. In 1886–88 he studied the universities of Würzburg and Heidelberg, anwhile holding the assistant professorship of any in the University of Tokio to which he d been appointed in 1883. He became full fessor in 1890 and seven years later was ointed director of the Botanical Gardens. collaborated in Brinkley's 'Japanese-English tionary' (1896) and published 'Nomenclature Japanese Plants in Latin, Japanese and nese' (1884); 'Names of Plants and their oducts in English, Japanese and Chinese' (1892); 'Conspectus of Leguminosæ' (1902); 'Index Plantarum Japonicarum: Cryptogamæ' (1904); 'Phanerogamæ' (1905); 'Tentamen Floræ Lutchuensis,' with Ito (1899); 'Revisio Alni Specierum Japonicarum' (1902); 'Enumeratio Plantarum in Insula Formosa Sponte Crescentium' (1906); 'Chinese Names of Plants' (1915); 'Classified Etymological Vocabulary of the Japanese Language Ancient and Modern' (1915); 'Vocabulary of Yamato' (1921).

MATSUSHIMA, Japan, village on the northeast coast of the island of Hondo, situated on the Bay of Sendai. In a lagoon opposite the village are 808 islets ranging in elevation from 30 to 300 feet and covered with pines. This beautiful natural garden is one of the wonders of Japan.

MATSUYAMA, Japan, town and capital of the district of Ehime, on the island of Shikoku, five miles from Mitsu. It contains a great feudal castle, one of the few perfect specimens of its period in modern Japan. Pop. (1925) 58,292.

MATSUYE, or MATSUE, Japan, town and capital of the district of Shimane, on the island of Hondo, 140 miles north by west of Kioto. It has large paper manufactories and agate-polishing establishments and has numerous temples. It is well built and is one of the cleanest towns in Japan. Pop. 36,209.

MATSYS, mät-sīs′, **or MASSYS, Quentin,** Flemish painter: b. Antwerp or Louvain, about 1460; d. there, between 13 July and 16 Sept. 1530. A blacksmith until he was 20, legend says that he turned artist to win the love of a painter's daughter. He was acquainted with many of the notables of the day, including Dürer, Erasmus and Sir Thomas More. Much of his present fame is due to genre pictures, especially of misers and money-changers, which are not his work, but that of his school, among them his son Jan, whose 'Misers' is at Windsor Castle. Matsys' own work is styled a connecting link between Van Eyck and the later Dutch realists; apart from such excellent portraits as those of Maximilian of Austria and Petrus Aegidius, it is mostly religious in theme. The 'Burial of Christ,' an altarpiece for the Antwerp Cathedral, now in the Antwerp Museum, and the 'Story of Saint Anne,' now in the Brussels Gallery, are the best examples of his work. The Metropolitan Museum, New York, contains his 'Adoration of the Kings.' Consult Cohen, Walter, 'Studien zur Quentin Metsys' (Bonn 1904) and de Bosschère, Jean, 'Quentin Metsys' (Brussels 1907).

MATTAWA, or MATTAWAN, Canada, town in the Nipissing district of Ontario province, situated at the confluence of the Mattawa and Ottawa rivers at the east end of Lake Timiskaming, on the Canadian Pacific Railroad, 38 miles east of North Bay on the Trans-Canada Highway. The town has extensive lumber interests, and hardwood blocks for the manufacture of airplane propellers are produced here. It is also famous as the starting point of hunters and anglers in the vicinity. Pop. (1931) 1,631.

MATTAWA, a river of Ontario, the source of which is Trout Lake, east of Lake Nipissing. It flows east a distance of about 45 miles and enters the Ottawa River at Mattawa, 308 miles from Montreal. This river forms part of an almost continuous water-way from the Ottawa

River to Lake Huron, and before the Canadian Pacific Railroad was built this water route was much used for transportation and travel.

MATTEAWAN, măt-tẹ-ą-wŏn', N. Y. See BEACON, N. Y.

MATTEI, măt-tā'ē, **Tito,** Italian musician and composer: b. Naples, 1841; d. 30 March 1914. He was educated in Naples. He received the degree of professor in Saint Cecelia's Academy at Rome when he was 11 and was also elected a member of the Philharmonic Society in Florence and other cities. He gave his first concert when 15 and afterward made tours of Europe, but in 1863 settled in London, where he lived for 50 years, confining his concert tours to Great Britain, and in 1870 he conducted an Italian opera at the Lyceum Theatre. He was the composer of hundreds of songs and pianoforte pieces, many of which have become widely popular, and the operas 'Maria di Gand,' 'La Prima Donna,' etc.

MATTER, *in physics, mechanics and chemistry,* the tangible substance of which the world external to our minds is composed and which is characterized by the resistance which it opposes to muscular efforts exerted upon it. Since we can know it only through the mediation of our senses, its actual objective reality has often been questioned by philosophers and metaphysicians; and in order to avoid doubtful points of this sort it is frequently defined merely as a "physical concept," without making any hypothesis as to its objective existence. (Consult Pearson, 'The Grammar of Science'). In physics and chemistry we think and speak of it as having a real existence, however, just as we do in common life. For scientific purposes it is highly important to be able to accurately compare the quantities of matter in two bodies; but the phrase "quantity of matter" is not commonly used in science, the word "mass" (or inertia) being substituted for it. The term "mass" is synonymous with "quantity of matter" so long as the bodies compared are identical in composition and in physical state; but by its use we avoid the uncertainty in the meaning of the longer phrase, when it is applied to bodies of dissimilar composition. Two bodies are said to have "equal masses" under the following conditions: Let the two bodies be conceived to be initially at rest, and free from the action of any external forces whatsoever. Let them then be exposed to the action of equal forces for an equal length of time. If, under these circumstances, the velocities that are produced in the two bodies are equal, the masses of the bodies are also equal, *by definition.* But if the velocities that are produced are unequal, then the masses are also unequal, and are (by definition) proportional to these velocities; the body which is moving the faster being the one whose mass is the less. It would be impossible to carry out an elaborate experiment of this kind every time we wished to compare the masses of a pair of bodies, and it fortunately happens that masses can be compared with great accuracy by merely weighing the bodies against each other in a balance. For equality of weight means that the earth's attractive force is the same upon both; and if (as we know to be the case, by experiment,) the two bodies would fall with the same speed in a vacuum, it follows that equal forces acting upo the two bodies for equal times communicate them equal velocities; and hence, by the defin tion of "mass," the mass of the two bodies a equal. It will be noted that mass and weig are two essentially different things, althoug they are very commonly confused, because th are strictly proportional to each other, accor ing to the most accurate experiments that ha yet been made. Yet it is not at all impossib to imagine a state of things in which mass a weight would not be strictly proportional. It only by experiment, for example, that we kno that the earth attracts a body with precisely t same force, whether the body is hot or col The attraction between two permanent magne varies with the temperature, and it may yet found that gravitative attraction varies in t same way, though to a much smaller exte Numerous experimenters have in fact fanci that they could detect an effect of this kin though its reality is not yet admitted. But can hardly admit that the mass of a body is function of the temperature; and so we see th the apparently strict proportionality betwe mass and weight is not at all a necessity thought, but merely an experimental fact, whi may any day be shown to be nothing but a clo approximation to the actual truth.

So far as we know, matter can neither be d stroyed nor created by any experimental mea at our command, nor by any process now ope ative in nature. This great fact is often call the "law of the conservation of matter," and appears to be rigorously true. As has be pointed out above, future experiment may sho that the weight of a body depends to a slig extent upon its temperature, and it may also found that the weight of a chemical compou is not always precisely equal to the sum of t weights of its constituents; but it is believ that any irregularities of this sort that may discovered will hold true to the weight onl and will not affect the mass; and that t weight will also return to its original val when the substance that is weighed is broug back to the same chemical and physical cond tion again. The gravitative action of matt is one of its most singular attributes, and o which we are still far from understandin It is apparently true that every particle matter attracts every other particle with a for which is directly proportional to the product the masses of the two particles and inverse proportional to the square of the distance b tween them, and independent of every oth circumstance. It is not certain that this la holds true, nor that the attraction exists at a at distances comparable with the distance fro the earth to the fixed stars, but it appears hold rigorously at distances commensurate wi the dimensions of the solar system. Electr and magnetic forces may be either attracti or repulsive; but gravitative action is probab always attractive, the only phenomena whic would countenance the opposite view being th apparent repulsion that the sun exerts upon th tails of comets and upon the coronal streame that are seen at the time of a total solar eclips

Matter exists in three (or perhaps four physical states. All ordinary bodies, for exam ple, may be classified, roughly, either as solid or fluids; fluids being further subdivided int liquids and gases. This classification is not a

ät could be desired, since there are certain dies (such as wax) which have certain characteristics of the solids and certain others of e liquids. A more complete and systematic ıssification is hardly practicable, however, in e present article. A solid body may be deed as a body capable of resisting a considerle shearing stress. (See ELASTICITY). Solid dies usually have a considerable tensile strength so. A solid does not yield continuously to small deforming force; it resists deformation, d its resistance increases as the deformation creases. A fluid, on the other hand, is a subance having almost no shearing strength, and fering very little resistance to forces that tend change its shape. A fluid yields continuously a deforming force, and a force that will form it at all will deform it indefinitely, so ng as it is allowed to act. Considering the bdivision of fluids into gases and liquids, we ay say that a gas is a fluid that presses conuously and in every direction upon the walls the vessel containing it and which follows em indefinitely if they retreat. A gas, if left itself, tends to expand infinitely in all direcns. A liquid is a fluid which does not follow e walls of the containing vessel if they retreat d which has no tendency to expand indefiely if left to itself. (For the prevalent ories regarding the constitution of matter, e GASES, KINETIC THEORY OF; MOLECULAR HEORY).

When a gas is rarefied very highly by a merry vacuum pump, it exhibits properties which different in many respects from those manited by gases in the ordinary state of density. e pressure in such a rarefied gas, for exam, may be different in different directions; so at in this respect, at least, the rarefied medium mbles a solid rather than a gas or liquid. chanical and electrical properties are also obved at high exhaustions which cannot be reoduced at ordinary pressures; and for these l other reasons Sir William Crookes considd that a gas, when under only (say) the llionth or ten millionth of an atmosphere of ssure, may be fairly said to constitute a urth state of matter," which he considered to as different from the gaseous state as the seous state is from the liquid state. At first ought this appears to be an extreme and dly a justifiable view; but it must be remmed that Thomas Andrews showed that the tinction between a liquid and the gas or vapor ained from it by evaporation ceases to exist temperatures higher than a certain critical ue peculiar to each substance. (See CRITICAL INT). This temperature is about 88°F. for bon dioxide, and at temperatures progresely higher than this the isothermals of carn dioxide approximate with increasing closeis to the hyperbolas of a perfect gas. It ght be thought that a critical state exists with erence to the solid and liquid states; but is is still somewhat doubtful. It appears probe that no such state exists between a solid l its liquid, unless the solid is crystalline; l its existence has not been established even this case.

See MOLECULAR THEORY; LIQUEFIED AND MPRESSED GASES; ELECTRON THEORY; SOLUNS; ETHER; VACUUM.

MATTERHORN, mät'ĕr-hôrn, or **MONT CERVIN,** môn sĕr-văn', Alpine mountain on the Italian frontier of Switzerland, 6 miles southwest of Zermatt, 14,780 feet in height; it is known in Italian as MONTE SILVIO.

MATTESON, măt'ĕ-sŏn, **Tompkins Harrison,** American artist: b. Poughkeepsie, N. Y., May 9, 1813; d. Sherbourne, N. Y., Feb. 2, 1884. His early lessons in art were from an Indian; otherwise he was mostly self-taught until after the success of his *Spirit of '76,* when he settled in New York and studied in the National Academy. From 1851 until his death his home was Sherbourne. For a time he was a member of the New York legislature. His themes were historical or from American country life, and his best-known pictures are *The First Sabbath of the Pilgrims, Examination of a Witch, Eliot Preaching to the Indians, Rip Van Winkle's Return from the Mountains, At the Stile,* and *Foddering Cattle.*

MATTHEW. Matthew, the apostle of Jesus Christ, is with sufficient certainty identified with Levi, the son of Alphaeus, whose call by Jesus to discipleship is described in Mark and Luke in terms practically identical with a story of the call of Matthew in Matthew. It was not uncommon among the Jews for a man to have two names, and sometimes both names were of Hebrew, or Aramaic origin. The derivation and consequently the meaning of the name Matthew is uncertain, though it is commonly interpreted to mean "Gift of God." The mere mention of his father's name does not identify his family to us. He is first spoken of as being in his office as a "publican," or collector of taxes, presumably near Capernaum on the great highway between Damascus and the Mediterranean. While as such officer he would be in the service of the Tetrarch Herod, and not directly in Roman employ, yet he must have shared the obloquy which attached to this office among strict Jews, and it has accordingly been reckoned a mark of his humility that we find him designated as "the publican" in the Gospel which bears his name. After his call to discipleship he made a great feast of farewell, gathering his former friends and business associates to meet his new-found Master and the disciples attending him. The name of Matthew stands in all the lists of apostles, always the seventh or eighth in order, but of his activities as an apostle we have no record. No other name than his has ever been associated with the authorship of the first Gospel, and while this view has been discredited by many critics, because of the difficulty of considering the Gospel in its present form the work of an apostolic eyewitness, it is possible to conserve the historical value of this strongly confirmed tradition by holding that he was the author of the Discourse Document which constitutes such an important and characteristic element in Matthew. (See article MATTHEW, GOSPEL ACCORDING TO). There are many variant traditions as to the missionary labors of Matthew, Macedonia, Egypt, Ethiopia, and Parthia having been named as places where he worked. There is no sufficient reason for accepting any of these traditions, though perhaps the last is the most probable. Some traditions assert that he died as martyr and this has been accepted in the Western Church, but according to other

traditions perhaps no less reliable he died a natural death.

DAVID FOSTER ESTES,
Late Professor of New Testament Interpretation, Colgate University.

MATTHEW, George Frederick, Canadian geologist: b. Saint John, New Brunswick, 1837. He received his education at the University of New Brunswick; secured a civil service post in 1853 and in 1879 was appointed chief clerk of customs. He was made surveyor of customs in 1893. He collaborated with Bailey, in 1872, in preparing a report on the geology of southern New Brunswick and in the following year prepared a report on the carboniferous system of that province. Subsequently he made several geological tours of exploration in the Maritime Provinces. He was a Fellow of the Royal Society of Canada and member of the New Brunswick Natural History Society. He published geological papers in various technical and scientific periodicals. D. 14 April 1923.

MATTHEW, Gospel According to. The Gospel with which the name of Matthew has uniformly been associated has with almost equal uniformity stood first in the gospel canon. It received this place both because it is the longest of the Gospels and because of the apostolic authority which the name of Matthew gave to it, but the place is fitting also because it relates itself more closely to the Old Testament than does any other gospel.

Contents.—As respects the events recorded, they are much the same as those given in Mark and Luke, and are arranged in substantially the same order. The book may be briefly analyzed somewhat as follows: Introductory, genealogy, birth and infancy of Jesus, ministry of John the Baptist, baptism and temptation of Jesus, i, 1–iv, 11. I. Early Galilean ministry (iv. 12–xii, 50). II. Later ministry in Galilee and neighborhood, and the Perean journey (xiii, 1–xx, 34). III. Entry of Jesus into Jerusalem and his teaching there, mainly controversial (xxi, 1–xxiii, 39). IV. Eschatological discourse (xxiv, 1–xxv, 46). V. Closing scenes, anointing at Bethany, last supper, agony in Gethsemane, trial, crucifixion, death and resurrection (xxvi, 1-xxviii, 20). In addition to the story of events and many brief reports of sayings of Jesus, this Gospel is marked by a cycle of five long discourses, each followed by a uniform formula, "It came to pass when Jesus finished." These discourses are "The Sermon on the Mount" (v, 1–vii, 27); the "Address to the Apostles" (x, 5–42); the collection of "Kingdom Parables" (xiii, 1–52); the "Discourse on Humility and Forgiveness" (xviii, 1–35); and the "Apocalyptic Discourse" (xxiv, 4–xxv, 46). While it need not be doubted that Jesus spoke at length on each of the occasions with which these discourses are connected, it is commonly held, especially in view of the somewhat parallel reports in Luke, that the author has gathered sayings spoken at various times and grouped them into what may be called "bouquets" of discourse, uniting them, not on the ground that all were spoken on the same occasion, but rather according to a logical association of ideas. This Gospel is also characterized by an arrangement of material in groups of threes, fives or sevens, presumably to aid the memory. Some 40 triplets have been named, e.g., the genealogy is arranged in three groups of 14 generations each, in chapters viii and ix there are three miracles of power, followed by three of restoration, there are given three prayers in Gethsemane, etc. Groupings by five and seven are not so common but occur often enough to deserve note as a striking characteristic of this book.

Purpose.— The purpose of the author plainly was to confirm Jewish Christians in their belief that Jesus of Nazareth was the Messiah long foretold by the prophets and expected by his nation. This is strikingly shown by the many references to the Old Testament which is cited no less than 40 times, often with the formal statement "that it might be fulfilled." The frequent use of the title "Son of David," as well as the genealogy which is traced back to Abraham through the royal line of David, the declaration in the Sermon on the Mount of his right to legislate parallel to the original gift of the Divine law through Moses, the assertion that the kingdom would be taken from the Jews and given to others and the grief over Jerusalem, the picture of himself as the judge at the Final Judgment, these claims in addition to the claims of Messiahship found in the other Gospels and culminating in the declaration of the Risen Christ that all authority in heaven and earth alike is his, all this abundantly proves that the object of the author was to show that Jesus of Nazareth was the promised Messiah and that all the Divine promises were to be fulfilled, not for the nation at large which had rejected him, but for his followers, because they had accepted him.

Sources.— Careful comparison of the first Gospel with the second shows that the order of events is substantially the same in both and that almost every paragraph of Mark is reproduced in Matthew, the exceptions being only seven brief paragraphs of at most less than 35 verses. As the theory that Mark is an abbreviation of Matthew has proved untenable, it follows that Matthew must be in some way dependent on the material of Mark: the resemblance is too close to permit the supposition that both drew from some independent document. But while the source of Matthew must have corresponded in general very closely to the present form of our Mark, yet this contains so much of picturesque detail which is not reproduced in Matthew that it cannot reasonably be held that Mark as we now have it was the source in question. How to account for this difference is still a problem of criticism. It is generally held that there may also be traced in Matthew a second main source, sometimes called the "Logia" document, sometimes "Q." (See article GOSPELS). In addition there is some material which cannot reasonably be traced to either of the two main sources, as the genealogy and the infancy narratives, but it is impossible now to trace the origin and extent of these special sources. This fact need not, however, impair our sense of their trustworthiness. It may also be noted that it is not reasonable to hold that the author of this book was a mere copyist who kept slavishly to the exact form of any written sources which lay before him.

Authorship.— The author of this Gospel for Jewish readers must of course have been himself of Jewish descent. Nor is his use of the

eek language inconsistent with this, since the e of Greek was so widespread that in the 1st ntury Palestine must have been largely bi-gual. That he was a Palestinian Jew is mani-t from the whole tone of his work. It also kes it doubtful whether the author of the book it now stands was himself an associate of sus in his ministry. While much of the ma-ial must go back to eyewitnesses, the author nself seems more remote. Accordingly, the dif-ulty in the way of accepting the early and iform tradition that the Apostle Matthew was e responsible author is increasingly felt. It is nerally recognized that the book does not have e unavoidable marks of being a translation, but ows that it must have been originally com-sed in Greek, while the early tradition was at Matthew composed his work in the "Hebrew nguage," by which was meant Aramaic, which d long before replaced Hebrew in common use. will retain the substantial value of the tradi-n if it is held that Matthew was the author of

When the Marcian source was reworked to clude the collection of discourses and other ma-ial which was due to Matthew, it would not surprising to find his name attached to the ole work. Accordingly, while the direct au-rship by Matthew of the book in its pres-form is still very commonly held, there is perhaps increasing tendency among critics to nnect only the Logia document with the apostle atthew himself, and in this way his name became ached to the First Gospel.

Date and Place of Composition.—There is le dissent at present from the view that this spel was composed late in the seventh decade the 1st century, presumably 65–68 A.D. As to place of composition there is less agree-nt. The material is Palestinian, but many l a certain sense of detachment as if the hor was not of Palestine when he wrote amid scenes which he describes. Of course this ght be true if written in some place in Pales-e remote from both Capernaum and Jeru-em; some Syrian city has been suggested, and n Alexandria has been thought not too remote, ecially in view of its large Jewish and Jewish-ristian population.

Authenticity and Value.—If the common w of Matthew's direct authorship is still to accepted, then this Gospel as the work of apostolic associate of Jesus must be trust-rthy and valuable in the highest degree. If, the other hand, the book is referred to an named author who worked mainly on the is of the Marcan and Logia documents, its stworthiness and value will be impaired less n might at first be supposed. We must as-ne the honesty of the compiler and editor, ich indeed is everywhere manifest, and ac-ding to the theory he was working on uments which embodied the common Chris-n tradition approved by the many dis-les who had seen Jesus face to face or which n had full apostolic authority. Such were sumably the Marcan source and most prob-y the Matthaean Logia, while the genealogy ld have been drawn from public sources, and tone of the infancy narratives is such as clusively to guarantee their very early date. en all these facts are taken into account, will appear that the latest criticism really con-ns the often quoted saying of Renan: "The spel of Matthew, all things considered, is the most important book of Christianity—the most important book that has ever been written."

MATTHEW TOWN. See INAGUA, GREAT.

MATTHEWS, James Brander, American author: b. New Orleans, La., Feb. 21, 1852; d. March 31, 1929. He was graduated from Columbia in 1871, from Columbia Law School in 1873, admitted to the New York bar (1873), began to contribute to the magazines in 1873, later turned wholly to literature and in 1892 was appointed professor of literature at Columbia. In 1900–1924 he was professor of dramatic literature. He was a founder of The Players and Authors clubs, of the Dunlap Society, and the American Copyright League, and of the Columbia University Press. In 1889–1891 he was president of the 19th Century Club. He was decorated with the French Legion of Honor in 1907; elected to the American Academy of Arts in 1908. He was made president of the Modern Language Association in 1910 and of the National Institute of Arts and Letters in 1913–1914. His published volumes include, from an extensive list, the following: *French Dramatists of the Nineteenth Century* (1881); *Pen and Ink* (1888); *American Literature* (1896); *The Development of the Drama* (1902); *Molière: His Life and His Works* (1910); *Shakspere as a Playwright* (1913); *On Acting* (1914); *The Oxford Book of American Essays* (1914); *Essays on English* (1921); *Playwrights and Playmaking* (1923). He wrote several plays and novels but was best known for his critical papers.

MATTHEWS, Francis Patrick, American public official: b. Albion, Nebr., Mar. 15, 1887. He received the degree of bachelor of laws from Creighton University, Omaha, in 1913. He became a prominent lawyer in Omaha, and he was counsel for the Reconstruction Finance Corporation, 1933–1949. He is much concerned with charities, including the Omaha Community Chest, the National War Fund, and the National Conference of Catholic Charities. He is an active member of the Knights of Columbus; he was made knight commander of the Order of St. Gregory in 1938 and received the Grand Cross of that order in 1942; in 1944 he was named papal chamberlain by Pope Pius XII. As special representative of the Catholic Administrative Board of Bishops, he visited Europe and the Near East in 1943–1944, to study the problems of relief for displaced persons and of welfare services for the armed forces. He was a member of the President's Committee on Civil Rights in 1946–1947, and a delegate to the Democratic National Convention in 1948. On May 13, 1949, he was appointed secretary of the navy, succeeding John L. Sullivan.

MATTHEWS, Franklin, American journalist: b. Saint Joseph, Mich., May 14. 1858; d.

26 Nov. 1917. Graduated from Cornell University 1883, he was reporter and editor on the Philadelphia *Press,* 1886–90, reporter, editor, correspondent of the New York *Sun,* 1890–1912. He was assistant Sunday editor and night city editor of the New York *Times,* 1912–15. He was associate professor of journalism, Columbia University, 1914. He was a trustee of Cornell University, 1913–18, and also president of the Cornellian Council, 1915. He published 'Our Navy in Time of War' (1899); 'The Newborn Cuba' (1899); 'With the Battle Fleet' (1909); 'Back to Hampton Roads' (1909).

MATTHEWS, John Hobson, English archivist: b. Croydon, near London, 1858; d. Ealing, 23 Jan. 1914. He was educated at the Proprietary School of Blackheath and at The Leys, Cambridge. In 1877 he entered the Roman Catholic Church and two years later was made a solicitor. From 1894 to 1903 he was employed as archivist to the corporation of Cardiff, Wales, and was also archivist to the county and urban councils of Monmouthshire. His various avocations included those of expert archivist, record searcher, genealogist, journalist and legal antiquary. In 1895 he discovered the text of the grant of Cardiff lands to Sir William Herbert, in 1550, the document being almost illegible. In the following year he brought to light the text of a charter to the borough of Newport. In 1903 and 1911 he was called as expert before the Royal Historical Manuscripts Commission. He published 'History of St. Ives, Cornwall'; 'History of the Hundred of Wormelow'; 'The Vaughans of Courtfield'; 'The Old Faith and the New'; 'Life and Memorials of St. Teilo'; 'The Mass and its Folklore'; 'Continuity Reconsidered.' He continued Duncumb's 'Herefordshire,' edited 'Cardiff Records' (1898–1905) and contributed to 'The Catholic Encyclopedia,' the *Tablet, Athenæum,* etc.

MATTHEWS, Marmaduke Matthews, Canadian artist: b. Warwickshire, England, 1839; d. 1913. He received his education in Oxford and London; removed to Toronto in 1860 and resided in New York from 1864 to 1869. In the latter year he returned to Toronto, was one of the founders of the Ontario Society of Artists, of which he was president in 1894. He excelled in woodland studies. His best-known works are 'The Canadian Wonderland' and 'The Conquered Portal.'

MATTHEWS, Paul, American Protestant clergyman: b. Glendale, Ohio, 25 Dec. 1866. In 1887 he was graduated at Princeton University and three years later at the General Theological Seminary, New York. In 1891 he was ordained to the ministry of the Protestant Episcopal Church; served as assistant at the church of the Advent, Walnut Hills, Cincinnati, 1890–91; entered the Associate Mission, Omaha, and had charge of Saint Paul's and Saint John's churches in 1891–95. From 1896 to 1904 Dr. Matthews was rector of Saint Luke's, Cincinnati, and from 1904 to 1913 was dean of Saint Paul's Cathedral of the same city. In 1913–15 he was dean of the cathedral at Faribault, Minn., and professor at Seabury Divinity School. On 25 Jan. 1915 he was consecrated bishop of New Jersey.

MATTHEWS, Stanley, American jurist: b. Cincinnati, Ohio, 21 July 1824; d. Washington, D. C., 22 March 1889. He was graduated from Kenyon College in 1840, studied law and was admitted to the bar in 1842, when he established a practice in Maury County, Tenn., but returned to Cincinnati in 1844 and engaged in practice there. He was editor of the Cincinnati *Herald,* an anti-slavery journal, in 1846–49, and held various political offices, and in 1855–56 was a State senator. In 1858 he was appointed United States district attorney for the southern district of Ohio, but at the outbreak of the Civil War in 1861 entered the volunteer service and was commissioned lieutenant-colonel and was a colonel when in 1863 he resigned to accept the seat of judge of the Superior Court of Cincinnati. He was elected United States senator in 1877 after having acted as counsel before the Electoral Commission, and in 1881 he was appointed a justice of the Supreme Court of the United States.

MATTHEWS, Washington, American physician and ethnologist: b. Killiney, Dublin County, Ireland, 1843; d. 1905. In 1864 he was graduated at the medical school of the University of Iowa. He was commissioned assistant surgeon in the United States army, from which he retired as surgeon in 1895. He made several anthropological studies of the Indians of North America. His published works include 'Dictionary of the Language of the Hidatsa' (1873); 'Navaho Silversmiths' (1883); 'Navaho Weavers' (1884); 'The Mountain Chant, a Navaho Ceremony' (1887); 'Navaho Legends' (1897); 'The Mystic Chant, a Navaho Ceremony' (1902); 'Navaho Myths, Prayers and Songs' (1907).

MATTHIAS, mą-thī'ąs, a disciple of Jesus, probably one of the 70, who was chosen by lot to take Judas Iscariot's place among the 12. Little is known of him. Even early legend confused him with Matthew, and an apocryphal gospel was attributed to him. In the Roman Catholic Church 24 February, in the Greek 9 August, is sacred to him. The 'Acts of Andrew and Matthias' make him a missionary in Africa. Consult Eusebiús, 'Ecclesiastical History' (Vol. I, 12; II, 1).

MATTHIAS (Ger. mät-tē'äs), emperor of Germany: b. Vienna, 24 Feb. 1557; d. 20 March 1619. He was a younger son of Maximilian II. He was made governor of Austria in 1593 and two years later became heir to the imperial throne. He fought in the war against the Turks and in 1606 was made head of the House of Hapsburg. He became king of Bohemia in 1611 and had annexed Hungary and Moravia before the death of Rudolf II. In 1612–19 he was emperor of the Holy Roman Empire, having been elected on the death of his brother, Rudolf II (q.v.). His reign was an unsuccessful one owing to the religious dissensions among the constituent parts of his empire. He attempted in vain to suppress by decree the Catholic League and Protestant Union. Consult Gindely, A., 'Rudolf II und seine Zeit' (Prague 1868) and Heling, J., 'Die Wahl des römischen Königs Matthias' (Belgrade 1892).

MATTHIAS I, Hunyadi («Corvinus»), kŏr-vē'noos, THE GREAT, king of Hungary: b. Klausenburg, Transylvania, 23 Feb. 1440; d.

énna, 4 April 1490. The second son of John
nyady, he was imprisoned in Bohemia by his
her's enemies, who strongly but unsuccess-
ly opposed his candidacy for the crown of
ngary in 1458. Another party of opposi-
n attempted to make the Emperor Frederick
king of Hungary; but Matthias brought
m to terms and in 1463 made peace with
ederick. By the Peace of Olmütz, 22 July
79, he gained Silesia, Moravia and Lausitz,
d the succession to the crown of Bohemia.
his wars with the Turks he was equally
ccessful and a part of Bosnia was ceded to
n by the Porte. War broke out again with
Austrian emperor; Matthias invaded his
ritory and captured and held Vienna. His
rt was a centre of scholarly men and his
rary, called the Corvina, a famous collection.
e internal administration of Hungary was
atly improved under Matthias. Consult
aknói, Vilmós, 'King Matthias Hunyadi'
udapest 1890; German trans., Freiburg
91) and Galeotti, Marzio, 'De egregie sapien-
et jocose dictis ac factis Matthiæ regis'
ienna 1746).

MATTING. While this term is usually
ployed to designate floor coverings made
m reeds and fibrous grasses, it is a generic
m which includes not only the commercial
ttings for house floors, which are made in
stern countries, but a much wider range of
icles useful in the domestic economy and in
ier employments, such as screens and tatties,
eping mats (used in India and the East), the
tting employed by nurserymen for protect-
g hotbeds and cold frames, and even some
ms of thatch. For the most part mattings
hand-woven, in the finer varieties the warp
ng cotton or other yarns and the filling the
ms of various sedges, reeds and grasses, an
ample being the familiar Japanese mattings
the house-furnishing stores. In the Russian
st mattings for nurserymen's use, bast of
linden tree is employed for both warp and
ing, very coarsely woven or plaited. The
ots of the Khus-Khus (*Andropogon squarro-*
s), a perennial grass of India, are woven into
agrant screens for open windows and also
de into awnings. The Taika rush mats of
rmosa are famous as sleeping mats, and the
st grades are said to be as fine and soft as
th, resembling the best Panama hat weaving.
nsul Davidson states that a mat of the high-
grade, measuring 5 x 6 feet, requires the
or of a girl weaver 120 days, and such mats
ve sold for 60 to 70 yen (or about $40). The
sh is an unidentified species, but sleeping
ts are made from several species of *Cyperus*
d *Scirpus* found in Asia, Africa and other
untries.

The commercial mattings used for house
corations are for the most part of Chinese
d Japanese manufacture. In Japan two spe-
s are employed, *Juncus effusus*, the Bingo-i
t rush, which is always manufactured into
e costly mats used by the higher classes (and
own as Tatamiomote) and *Cyperus unitans*,
ich is employed for the cheaper grades. The
gest importer of these mats is the United
ates, England, Austria and Germany, follow-
g in the order named. The qualities of the
ngo-i are named as follows: Kinkwanyen,
nufactured at Okayama; first quality Aya-
mushiro, second quality Aya-mushiro, Damask
Aya-mushiro, common Aya-mushiro, manufac-
tured at Bittiro. First quality Somewake-
mushiro, common Somewake-mushiro, Damask
Hana-mushiro, common Hana-mushiro, manu-
factured at Bingo; ordinary Hana-mushiro
(best quality), manufactured at Chikugo. *Cy-
perus unitans* produces the Shichito-i mats
which are chiefly manufactured in the Oita pre-
fecture. The plant is cultivated both upon up-
land and irrigated lands. The varieties of
mats from this species are known by names as
follows: Kikaiori Hana-mushiro, Damask
Hana-mushiro, common Hana-mushiro (two
forms). Seidaka Hana-mushiro, manufactured
at Bungo. Mattings made from the two species
above have been exported in a single year to
the value of 650,000 yen, or over $400,000.

The Chinese and Korean mat rush is *Cype-
rus tegetiformis,* this species also being used
for the manufacture of cuffs and sandals. The
India commercial mattings are made chiefly
from *Cyperus corymbosus* and *tegetum;* the
latter being known as the Calcutta mat rush,
while the former is used for the Tinnerelly
mats which are the finest made in India. They
are also made at Palghat, but these are not so
fine. In the manufacture of the India mat-
tings the culms are split into two or three
parts and then woven into mats upon a warp
of threads previously stretched across the floor
of a room. The operator passes the culms
with the hand alternately over and under the
successive threads of the warp and presses
them home.

It would be difficult to enumerate all of the
mattings made in different countries, though
mention should be made of the fine and highly
prized Niihau mats of Hawaii, produced from
Cyperus levigatus. Matting is made in Spain
and Morocco from *Juncus maritimus,* and in
Italy from *Juncus acutus.* Two species of sword
rush, *Lepidosperma gladiatum* and *L. flexuo-
sum,* are used by the natives of Australia not
only for mats, but for baskets and other articles,
and *Lepironica mucronata,* found in Asia,
Africa and Polynesia, supplies the fibre for
the mats with which Chinese boatmen cover
their cargoes.

In the United States, a handsome and utili-
tarian form of floor matting is largely manu-
factured from Slough grass, *Carex filiformis.*
In normal years the imports of mattings to the
United States reach a total of $3,250,000.

The University of California conducted
many experiments with several species of mat-
ting rushes, chiefly *Juncus effusus,* and *J. Ro-
bustus,* from which a fine sample of matting
had been manufactured at a factory in Maine.
There are now about a dozen factories in the
United States manufacturing mats and matting
from grass and coir.

For matting fibres consult 'Dictionary Eco-
nomic Products of India,' 'Descriptive Cata-
logue of Useful Fiber Plants of the World,'
and 'The Island of Formosa,' by Jas. W.
Davidson. Consult also 'History and Manu-
facture of Floor Coverings' (New York 1898).
The leaves of many species of palm, in different
parts of the world, are used for native mats
and mattings, though few of these ever reach
commercial importance. See PALMS.

CHARLES RICHARDS DODGE.

MATTING FIBERS. See FIBER.

MATTIOLI, mät-tê-ô'lê, CONTE **Ercole Antonio,** Italian statesman and diplomat: b. 1640; d. Paris, Nov. 19, 1703. Nothing is known of his early life but as a young man he settled at Mantua and became the confidential secretary to Charles III and Charles IV, dukes of Mantua. His name has been passed down to posterity only because it is generally believed that he was the famed secret prisoner of Louis XIV, first referred to by Voltaire as "The Man in the Iron Mask."

From the private papers of Louis XIV it became evident that it was this man who was seized by the king for revealing to others the secret negotiations of France with Mantua for the sale of the Mantuan fortress of Casale. Mattioli was first confined at Pignerol, then at the island of St. Marguerite, and in 1698 he entered the Bastille, where he died five years later.

Much speculation was caused at the time (and later) as to the identity of the unknown prisoner. Some regarded him as the natural son of Louis XIV and others as the twin brother of the French king. Dumas père established him as the latter in his book *Vicomte de Bragelonne* (1848) in a section often published separately as *The Man in the Iron Mask.*

MATTIPI (South American name) or **FROG SNAKE,** a serpent (*Xenodon severus*) of northeastern South America. While a poisonous variety, it is slow to bite. Its posterior teeth serve as fangs, but it has no venom sacs. The bite causes temporary swelling and soreness, but is seldom fatal.

MATTOON, mă-tōōn', city, Illinois, in Coles County, at an altitude of 725 feet, 40 miles southeast of Decatur, and served by the Illinois Central and the Cleveland, Cincinnati, Chicago and St. Louis railroads and state and federal highways. Situated in an agricultural region, Mattoon is an industrial city, making furniture, shoes, utility equipment, roofing, Diesel engines, and brooms. Broom corn and soybeans are the major crops in the surrounding district. The two railroads serving the city have machine shops and repair shops there. The city has a public library, and nearby are a fish hatchery and Paradise Lake, formed by a dam on the Little Wabash River.

Mattoon was settled and incorporated in 1855, in connection with construction of the Illinois Central through this region, and was named for William Mattoon of that railroad, who played an important part in organization of the town. It was here, in 1861, that Ulysses S. Grant mustered the Twenty-first Illinois Volunteers into service, with himself as colonel, appointed by Gov. Richard Yates. The city has commission government, and the water supply is municipally owned. Pop. (1950) 17,547.

MATTSON, măt's'n, **Henry Elis,** American painter: b. Gothenburg, Sweden, Aug. 7, 1887. He came to the United States in 1906 and was naturalized as a citizen in 1913. He studied briefly (1912–1913) at the School of Worcester Art Museum, Worcester, Mass., although most of his training in art is self-taught. His marines and landscapes are represented in many of the nation's finest collections, among them the Metropolitan Museum of Art. the Whitney Museum of American Art, New York; the Carnegie Institute, Pittsburgh; the Corcoran Gallery of Art and the White House, Washington, D.C. He painted under the sponsorship of the Works Progress Administration and has murals at the post office in Portland, Me. His prizes include those of the Art Institute of Chicago (1931), Corcoran Gallery of Art (1935 and 1943), and Carnegie Institute (1935).

MATURIN, mătū'rĭn, **Charles Robert** Irish dramatist and novelist: b. Dublin, 1782 d. there, Oct. 30, 1824. He received his education at Trinity College, Dublin, entered the ministry of the Church of Ireland, and served successively as curate at Loughrea, County Galway and at St. Peter's, Dublin. He wrote the novels *The Fatal Revenge, or the Family of Montorio* (1807); *The Wild Irish Boy* (1808); and *The Milesian Chief* (1812), under the pseudonym of DENNIS JASPER MURPHY. The novels, written as Gothic romances, were ridiculed by the critics but attracted the favorable attention of Sir Walter Scott, who introduced Maturin to Lord Byron. These powerful friends secured the production of Maturin's tragedy *Bertram, or the Castle of St. Aldobrand* at Drury Lane in 1816 with Edmund Kean in the leading role. It ran for 22 nights, and a French version was produced soon afterward at the Théâtre Favart Paris. His other tragedies *Manuel* (1817) and *Fredolfo* (1819) failed totally. Among his other works were the novels *Women* (1818); *Melmoth the Wanderer* (1820); and *The Albigenses* (1824). *Melmoth* is his greatest work and was most successful in its day.

MATURIN, mä-tōō-rēn', town, Venezuela capital of the state of Monagas, formerly the capital of the state of Maturin. It is on the Guarapiche River, north of the Orinoco, 25 miles by rail above its port, Colorado, and 40 miles from the sea. A considerable trade with the West Indies, principally in cattle and hides, is carried on. In the neighborhood are extensive plantations of cacao, sugar cane, fruits, and cereals. Its industrial establishments turn out cigars, starch, hammocks, boots, shoes, and soaps. There are petroleum fields nearby. Maturin is the birthplace of two presidents of Venezuela, José Tadeo Monagas and José Gregorio Monagas. Pop. (1941) 10,705; (1950) 25,350.

MATZOON, măt-sōōn', a milk food used in Armenia; prepared by exposing milk in open vessels to a heat of 90°F., and when coagulation takes place the curd is broken up by a churning process and salt is added. See also KUMISS.

MATZOTH, mät'sōth, the Hebrew name for a kind of unleavened bread or biscuit eaten by the Jews during the feast of the Passover.

MAUBEUGE, mō-bûzh', fortress and manufacturing town, France, in the Department of Nord, occupying both banks of the Sambre, 49 miles southeast of Lille, within two miles of the Belgian frontier. The origin of Maubeuge was in a double monastery for monks and nuns founded in the 7th century. Destroyed successively by the Normans, by Louis XI, by Francis I, and by Henry II, it finally fell to France by the Treaty of Nimeguen in 1678, and was fortified by the marquis de Vauban. Pre-

ous to outbreak of World War I in 1914 it was efended by nine forts. The principal industry is ie manufacture of iron and steel products. The wn was occupied by the Germans in 1914 and gain in 1940. Pop. (1946) 20,859.

MAUCH CHUNK, môk chŭngk, Pa., borugh and Carbon County seat, situated on the ehigh River at an elevation of 916 feet, 29 miles orthwest of Allentown; it is served by the Cenal of New Jersey and the Lehigh railroads. The rst settlement here, on the edge of the Pennsylania anthracite coal region, was begun in 1815 y the Lehigh Coal and Navigation Company. oth the Lehigh Canal and the Lehigh Valley ailroad had their start here. A gravity railroad, onstructed in 1827 to haul coal from the mines, as discontinued in 1870, and thereafter was a opular scenic railway until the 1930's. Mauch hunk, the Indian name for Bear Mountain, was ie home of Asa Packer (q.v.), builder of the Leigh Valley Railroad and founder of Lehigh Uniersity. Borough incorporation was effected in 846. Pop. (1930) 3,206; (1940) 3,009.

MAUD, a poem by Alfred Tennyson (q.v.), ublished in 1855. Tennyson called it a "monorama," a drama told in a series of lyric soliloies. His explanation of its unique form is is: "The peculiarity of this poem is that difrent phases of passion in one person take the ace of different characters." To tell the story *Maud* is to follow these phases of passion. he beginning shows the hero cut off from life his heritage of hate and wrong, crying for ar to kill the greed and cruelty of peace. With e coming of Maud, the child of his enemies, beus his new life of love that embraces mankind. is joy is shattered at its climax; a hopeless ile, he seeks only escape from the phantoms of e past. From this death in life, he is saved by e outbreak of war "in defence of the right." ne ending, written to the sound of cannon boomg from British battleships before the Crimean ar, is a paean of battle. It was this militant ain in *Maud* that shocked Tennyson's admirers d still provokes criticism. Yet read, not as a fense of any one war, but as an indictment the materialistic peace that is war and that uses war, the poem shows something of that ger vision that is prophetic.

As a monodrama, *Maud* fails to achieve draatic unity. Many of the separate lyrics are nuine bits of inner action, of soul drama, set rth with keen psychological analysis, with skill-l variation of meter to express fluctuation of eling. But sequence of action, the law of ama, is sacrificed to singleness of mood, the sence of the lyric. In *Maud,* as in *The Princess,* nnyson's attempt to fuse the lyric and the amatic moods fails. To think of *Maud* is to nk first of those songs that have become part the vocabulary of passion and of longing. nsult Tennyson, H., *Alfred, Lord Tennyson: Memoir,* 2 vols., (London, 1897); Grierson, H., *mbridge History of English Literature,* vol. 8, ap. 2 (Cambridge 1916–31).

FRANCES W. CUTLER.

MAUD MULLER, a poem by John Greenf Whittier, first published in the *National Era,* ecember 1854. It is a ballad reciting a romantic ssage in the lives of a susceptible judge and a untry girl.

MAUDE, SIR **Frederick Stanley,** British army officer: b. Gibraltar, June 24, 1864; d. Baghdad, Iraq, Nov. 18, 1917. Entering the army at the age of 20, he saw his first active service in the Egyptian campaign of 1885; during 1900–1901, in the South African War, he fought in several battles as a staff officer of the Guards Brigade. After three years as military secretary to the governor general of Canada he served at the War Office in connection with organization of the newly-formed territorial force. With outbreak of World War I in 1914 he went to France on the staff of the 5th Division, and shortly was given command of the 14th Brigade. He returned wounded to England, and in 1915 he was sent to the Dardanelles to assume command of the 13th Division; in Gallipoli he shared in the withdrawal from both Suvla and Helles. From Egypt, whither he had gone with his division, he was transferred to Mesopotamia, and there, after failure of the attempt to relieve Kut al Imara in August 1916, he became British commander in chief. Reorganizing his forces, he began an advance in December which drove the Turks from Kut and carried him on to Baghdad, where he concluded his successful campaign in March 1917. After a pause for preparation came another forward move, marked by the last victory of his lifetime at Tekrit. Again in Baghdad, Maude was struck down suddenly by cholera, which proved fatal.

MAUDSLEY, môdz'lĭ, **Henry,** English alienist: b. near Settle, Yorkshire, Feb. 5, 1835; d. Bushey Heath, Jan. 23 or 24, 1918. He graduated in medicine at the University of London in 1857, and thereafter specialized in mental diseases. From 1869 to 1879 he was professor of medical jurisprudence at University College, London. In 1913 he provided £30,000 for the erection in London of the Maudsley Hospital for the Insane. He edited *The Journal of Mental Science* from 1862 till 1878, and his numerous works included *Body and Mind* (1870); *Responsibility in Mental Disease* (1872); *The Physiology of Mind* (1876); *The Pathology of Mind* (1879); *Life in Mind and Conduct* (1902); and *Organic to Human* (1916).

MAUGHAM, môm, **William Somerset,** British author: b. Paris, France, Jan. 25, 1874. He was the son of Richard Ormond Maugham, the solicitor to the British Embassy in France, and was the youngest of six children. Orphaned at the age of 10, he went to England to live with an uncle who was vicar of Whitstable. He attended King's School at Canterbury for three years, and studied for a short time at Hyères, in south France. He spent the year 1891 in Heidelberg, Germany, where he frequently attended lectures at the university. In 1892 he entered the medical school of St. Thomas's Hospital in London, and after completing his studies, he became a physician. He discontinued the practice of medicine after one year in order to devote full time to writing. In 1915 he married Syrie Barnardo, an interior decorator; they had one daughter and were divorced in 1927.

His first book, *Liza of Lambeth* (1897), was a story which resulted from his experiences as a doctor in Lambeth, one of the poorer districts of London. *A Man of Honour,* his first play, was produced in 1903, although *Lady Frederick* in 1907, brought his earliest success; by 1908, four

of his plays were running simultaneously: *Lady Frederick, Jack Straw, Mrs. Dot,* and *The Explorer.* After the publication of *Of Human Bondage* (q.v.) in 1915, which is usually considered his outstanding achievement, he wrote a steady stream of plays, short stories, and novels. His plays, most of them drawing room comedies, were performed in Europe and the United States. Among them, *The Circle* (1921), *Our Betters* (1923), and *The Constant Wife* (1927) were outstanding. His last play, *Sheppey,* written and produced in London in 1933, was not especially successful.

Several of his novels and shorter pieces are reprinted almost annually. *The Moon and Sixpence* (1919), the story of an artist, was based on the life of Paul Gauguin. *Miss Thompson,* included in a collection of short stories, *The Trembling of a Leaf* (1921), was made into a play by John Colton and Clemence Randolph under the title *Rain* in 1922. *Ashenden, or The British Agent* (1928) was drawn from the author's experiences as an intelligence agent in Switzerland during World War I. *Cakes and Ale, or The Skeleton in the Cupboard* (1930) is a satirical story of two men of letters, who are often said to be Thomas Hardy and Hugh Walpole. In 1938 Maugham published an account of his literary experiences, *The Summing Up,* which has become a useful guidebook for persons interested in writing. *The Razor's Edge* (1944), the story of a young American's spiritual quest, brought his most immediate success, and was made into a motion picture in 1946. Among his more recent books are *The Mixture as Before* (1940), *Up at the Villa* (1941), *Then and Now* (1946), *Creatures of Circumstance* (1947), and *Catalina* (1948).

MAUI, mä'ōō-ē, one of the Hawaiian Islands, situated 26 miles northwest of Hawaii; it comprises two mountainous passes joined by an isthmus. The east peninsula contains Haleakala crater, 10,025 feet high, last active about 1750. There are large sugarcane and pineapple plantations. Wailuku, near the northwest coast, is the largest town and the seat of Maui County; it has supplanted Lahaina, on the southwest coast, where white men first established themselves in the island. The county of Maui comprises Maui, Lanai, and Kahoolawe. Pop. (1940) county 55,534.

MAULE, mou'lä, Chile, a maritime province bounded north by the province of Talcá, and south by the province of Nuble. The area is 2,172 square miles. Most of the surface is occupied by the forested coast range, averaging nearly 3,000 feet in height. Agriculture, stockraising, and lumbering are the principal industries. The province takes its name from the river Maule (q.v.). Linares (q.v.) the provincial capital, is on the main line of the state railroad; branch lines connect it with Cauquenes (pop. 11,198), the former capital, and with Constitución (pop. 7,049), the chief port. Pop. (1940) 70,497.

MAULE, a river of Chile, rising in the Andes and after a westerly course of 150 miles (52 miles navigable for small vessels) entering the Pacific Ocean immediately north of Constitución; it gives its name to the province of Maule (q.v.). The Maule River is believed to have been the southern boundary of the empire of the Incas.

MAUMEE, Ohio, village in Lucas County; altitude 648 feet; on the Maumee River; 8 miles southwest of Toledo; on Nickel Plate and Wabash railroads. It makes desks, cabinets, and butter coloring. Pop. (1930) 4,588; (1940) 4,683; (1950) 5,548.

MAUMEE, mô-mē', a river formed by the junction of Saint Marys and Saint Joseph rivers at Fort Wayne, Ind. It flows northeast across the northwest corner of the state of Ohio, and enters Lake Erie through Maumee Bay. Its affluents are the Auglaize and the Tiffin. Its basin is 6,700 square miles in extent. The river is 150 miles long and navigable 12 miles from its mouth to the Maumee Rapids.

MAUNA KEA, mou'nä kā'ä, Hawaii, a semi-active volcano, highest peak in the Hawaiian Islands, 13,784 feet in altitude. Snow covers its upper slopes for the greater part of the year; and its sides are wooded. Coffee is cultivated on the lower slopes.

MAUNA LOA, lō'ä, Hawaii, active volcano in the central southern portion of the island, 13,680 feet in altitude; the crater is nearly five miles in circumference, and on the inner side vertical precipices tower 500-600 feet. On the eastern slope of Mauna Loa is the still larger crater of Kilauea (q.v.), about nine miles in circumference but apparently having no communication with the former since their periods of activity are independent of each other. Mauna Loa's greatest activity was in 1881; it erupted on April 26, 1942, and again on Jan. 6, 1949. A sharp earthquake, accompanying its last eruption, rocked nearby Hawaii National Park Volcano House, but no damage was reported.

MAUNDY THURSDAY, môn'dĭ, the Thursday in Holy Week, the annual memorial of the Last Supper at which Christ washed the feet of his disciples. The ceremony of washing the feet of the poor on that day was originally kept by noblemen and prelates, as well as by the pope and Roman Catholic sovereigns. In Britain the ceremony was performed by the sovereign until the reign of William III, when it was transferred to the lord high almoner; it was discontinued in 1754. The maundy usage is now confined in Britain to gifts of money at Westminster Abbey to as many old men and women as there are years in the sovereign's age, one penny for each year, together with money in lieu of the clothes formerly given; the maundy pennies, first coined under Charles II, are silver and unmilled, and are legal tender. The yeomen of the guard carry the doles, which are distributed by the lord high almoner. Maundy Thursday is sometimes called Sheer or Chare Thursday.

MAUNOURY, mō-nōō-rē', **Michel Joseph,** French military officer: b. Maintenon, Eure-et-Loire, Dec. 11, 1847; d. en route from Paris to Orleans, March 28, 1923. He became an artillery officer in 1869, and in the Franco-Prussian War of 1870–1871 he was wounded at Champigny. In 1905 he attained the rank of general of division and had charge of the artillery of the Paris forts. General Maunoury was commandant of the École Supérieure de Guerre in 1907; the following year of the 15th Army Corps with headquarters at Marseilles, and in 1909 of the 20th corps at Nancy.

He was made military governor of Paris in 1910 and a member of the Superior Council of War. In the War of 1914–18 Maunoury was placed in charge of the army of manœuver and was rushed north in an effort to turn the flank of Von Kluck's army then driving toward Paris. When the latter discovered Maunoury on his right the drive was stopped and in the battle of the Marne the invader was driven back. Subsequently after the beginning of trench warfare Maunoury held a command at Soissons. He was severely wounded in March 1915 and in the same year received at the hands of the President of the Republic the *médaille militaire,* the highest military honor in the gift of France. He was also an officer of the Legion of Honor. In November 1915 Maunoury succeeded Gallieni as military governor of Paris. Consult Blanchon, G., 'Le général Maunoury' (Paris 1916). See WAR, EUROPEAN.

MAUPASSANT, Henri René Albert Guy de, ŏn-rē rē-nā äl-bār gē dē mō-pä-sän, French novelist: b. Chateau Miromesnil, Seine-Inferieure, France, 5 Aug. 1850; d. Paris, 6 July 1893. He began his career as a clerk in the Navy Department in Paris and also served for a time in the French army during the Franco-Prussian War. The novelist Flaubert, a friend of his mother's, was his godfather, and the youth took him as his model in the art of composition. After years of practice, during which he wrote and destroyed a great number of manuscripts, he allowed a short story, 'Boule de Suif,' to appear in 1880, a work which displayed the greatest finish and at the same time allied him to the naturalistic school of fiction. In the same year he published a book of verse, 'Des Vers,' and a drama, 'Histoire du vieux Temps.' After this he continued to cultivate the short story and was very soon recognized as one of the greatest writers of short stories the 19th century had seen. In spite of the perfection of art displayed in their construction neither his brief tales nor his novels form pleasant reading. They compel admiration, but they are dominated by pessimism and in his later work the traces of an unbalanced mind may be plainly seen. In 1890 De Maupassant's mental malady occasioned the cessation of literary occupation, two years later he became wholly insane and he died the next year in an asylum. His collections of short stories include 'La Maison Tellier' (1881); 'Mlle. Fifi' (1883); 'Les Sœurs Rondoli' (1884); 'Yvette' (1884); 'Contes du Jour et de la Nuit' (1885); 'Contes et Nouvelles' (1885); 'La Horla' (1887); 'La petite Roque' (1888); 'La Main gauche' (1889); 'Le Père Milon'; 'L'inutile Beauté' (1890), etc. The finest of his six novels is 'Pierre et Jean' (1888); the others are 'Une Vie' (1883; 'Bel Ami' (1885); 'Mont Oriol' (1887); 'Fort comme la Mort' (1889); 'Notre Cœur' (1890). He also published several collections of travel sketches, such as 'Au Soleil' (1884); 'Sur l'Eau' (1888); 'La Vie errante' (1890). A collection of 13 of his short stories published in English with the title, 'The Odd Number,' presents him at his best, both in point of art and as regards the stories themselves. The absence of a moral sense is less apparent here than elsewhere and there is less of gloom and pessimalism perceptible. Consult 'Œuvres complètes de Guy de Maupassant' (29 vols., Paris 1908–10); 'Works of Guy de Maupassant' (9 vols., New York 1910); Brunetière, Ferdinand, 'Le roman naturaliste' (Paris 1883); Doumic, René, 'Ecrivains d'aujourd'hui' (ib. 1894); Bashkirtseff, Marie, 'Further Memoirs' (London 1901); Symons, Arthur, 'Studies in Prose and Verse' (New York 1904); Mahn, P., 'Guy de Maupassant, sein Leben und seine Werke' (Berlin 1908); Matthews, Brander, 'Inquiries and Opinions' (New York 1907).

MAUPERTUIS, Pierre Louis Moreau de pē-ār loo-ē mō-rō dē mō-pĕr-tü-ē, French mathematician and philosopher: b. Saint Malo, France, 28 Sept. 1698; d. Basel, Switzerland, 27 July 1759. He was educated at the College of La Marche, Paris; entered the army in 1718 and after five years' service resigned in order to become instructor in mathematics in the Academy of Sciences. He went to England in 1728, where he was made a member of the Royal Society and became a pupil of Newton. In 1736 he conducted a scientific expedition to Lapland for the purpose of measuring an arc of the meridian, the result of which was confirmation of Newton's theory of the flattening of the globe at the poles. In 1743 he was elected to the French Academy, in 1744 was summoned to Prussia by Frederick the Great and in 1746 was declared president of the Academy of Sciences at Berlin. A dispute with the philosopher, König, regarding the discovery of the infinitesimal calculus shortened his days. Among his works are 'Sur la figure de la terre' (1738); 'Discours sur la figure des astres' (1742); 'Lettre sur la comète de 1742' (1742); 'Astronomie nautique' (1745; 1756); 'Essai de cosmologie' (1750); Maupertiana ou divers ecrits' (1753). Consult De la Baumelle, 'Vie de Maupertuis' (Paris 1856); Damiron, J. P., 'Memoires sur Maupertius' (ib. 1858); id., 'Mémoires pour servir à l'histoire de la philosophie du XVIIIe siècle' (Vol. III, ib. 1864).

MAUREL, mō-rĕl, Victor, French singer: b. Marseilles, 1848; d. New York City, 22 Oct. 1923. He was educated at the Paris Conservatoire and made his début in Paris in 1869. His first appearance in Royal Italian Grand Opera was in 1873 and he achieved a signal success. He created Iago in Verdi's 'Otello,' Falstaff in the opera of that name, and appeared in many operatic rôles in Europe and United States, being generally recognized as the leading acting baritone actor on the Italian stage. He published 'L'Art du chant'; 'Le chant renové par la science'; 'Dix ans de carrière,' etc.

MAUREPAS, Jean Frédéric, zhŏn frā-dā-rĕk mō-rē-pä, **Phélypeaux,** COMTE DE, French statesman: b. Versailles, 9 July 1701; d. there, 21 Nov. 1781. At 14 he succeeded to the office of Minister of State held by his father. In 1725 he became administrator of the navy, in which post he used the best knowledge then available to bring the navy to a high standard of perfection. He became Minister of State under Louis XV in 1738, but in 1749 was banished the court for an attack on Mme. Pompadour. In 1774 he was made Prime Minister by Louis XVI and became his principal adviser. The chief events of his administration were the restoration of the Parliament of Paris (12 Nov. 1774), and the alliance with and assistance of the American colonies in their struggle against Great Britain. He gathered

to the service of the state such men as Chrétien Guillaume de Lamaignon de Malesherbes, Le Comte de Vergennes, and Anne Robert Jacques Turgot. He intrigued against the latter, and replaced him as minister of finance by Jacques Necker in 1776. Five years later Necker experienced the same fate.

MAURER, mou'rĕr, **Georg Ludwig von,** German statesman and law historian: b. Erpolzheim, Nov. 2, 1790; d. Munich, May 9, 1872. He entered Bavarian government service in 1814, and in 1826 became professor of law at the University of Munich. During 1832–1835 he was a member of the regency council while King Otto was a minor; and for a short period in 1847 he served as Bavarian minister of foreign affairs and justice. Besides a number of volumes on early German systems of government, he wrote *Das Griechische Volk Vor und Nach dem Freiheitskampf,* 3 vols. (1835–1836).

MAURER, Louis, American artist: b. Biebrich, Germany, 1832; d. New York City, July 19, 1932. Migrating to the United States about 1851, he joined the staff of Currier and Ives, the well known New York City firm of lithographers. He lithographed and colored by hand many of their prints, notably, in 1855, *The Celebrated Horse Lexington,* depicting a famous trotting horse.

MAURETANIA, mô-rĕ-tā'nĭ-à, or **MAURITANIA,** ancient name for northwestern Africa, west of Numidia, varying in size at different periods but roughly corresponding to modern Morocco and western Algeria. The Romans became acquainted with the country during the war with Jugurtha, 106 B.C., and in 42 A.D. it was formed into a province by Claudius. In the 5th century the Vandals overran the country. See also MAURITANIA.

MAURIAC, mô-ryàk', **François,** French writer: b. Bordeaux, Oct. 11, 1885. Moving to Paris in 1906, he wrote poetry and poetry criticism for the *Revue de Temps Présent* and *Revue de la Jeunesse,* and published two volumes of his own verse: *Les Mains Jointes* (1909) and *L'Adieu à l'Adolescence* (1911). Turning to fiction after World War I, he won renown with *Le Baiser au Lépreux* (1922), *Genitrix* (1924), *Le Désert de l'Amour* (1925), and other books. Novels available in English translation include *Thérèse* (1928); *The Desert of Love* (1929); *Destinies* (1929); *The Family* (comprising *The Kiss of the Leper* and *Genitrix,* 1930); *Suspicion* (1932); *The Viper's Tangle* (1933). Among translations of his essays and works of criticism are *Maundy Thursday* (1932); *God and Mammon* (1936); *Life of Jesus* (1937); *Communism and Christians* (1938). In 1933 he was elected to the French Academy.

MAURICE, mô'rĭs, duke and elector of Saxony: b. Freiberg, March 21, 1521; d. near Sievershausen, July 11, 1553. In 1541 he succeeded his father, Henry the Pious, as duke, and, although a Protestant, refused to join the Schmalkaldic League. He fought for Charles V, and with the latter's aid became elector in the Albertine line in 1547. Subsequently opposed to Charles, in 1552 he forced the emperor to accept the Treaty of Passau. He was mortally wounded in a battle with Albert Alcibiades.

MAURICE (commonly known as MAURICE OF NASSAU), stadholder of the Dutch Republic: b. Dillenburg, Nov. 13, 1567; d. The Hague, April 23, 1625. The son of William the Silent, he was elected stadholder by the northern provinces following his father's assassination in 1584. Leading the Dutch in their war against the Spaniards, he gained victory after victory until 1609, when he made a 12-year truce with Spain. In 1618, following the death of his brother, Philip William, he became prince of Orange. He fell into a quarrel with his former supporter and friend, Jan van Olden Barneveldt, whose execution he secured in 1619. In 1621 he renewed the struggle against Spain, but his campaigns met with small success.

MAURICE, SIR **Frederick Barton,** British army officer: b. Feb. 1, 1871. He saw active service in northwest India (1897–1898) and the South African War (1899–1900), and with outbreak of World War I in 1914 went to France with the 3d Division. In 1915 he was made director of military operations at the War Office; he was placed on retired pay in May 1918 after he had questioned in the press some statements about the strength of the army in the field made by Prime Minister David Lloyd George, an action which led to a critical debate in Parliament. From 1922 to 1933 he was principal of the Working Men's College, St. Pancras, London, which had been founded by his grandfather, (John) Frederick Denison Maurice (q.v.). He wrote *Forty Days in 1914* (1920); *Lord Wolseley* (1924); *Robert E. Lee, the Soldier* (1925); *Governments and War* (1926); *British Strategy* (1929); *Life of Lord Haldane,* 2 vols. (1937–1938).

MAURICE, (John) Frederick Denison, English theologian: b. Normanston, Suffolk, Aug. 29, 1805; d. Cambridge, April 1, 1872. The son of a Unitarian clergyman, he studied at Trinity Hall, Cambridge University, prior to 1827, when he went to London and engaged in literary work. In 1834, after attending Exeter College, Oxford, he was ordained in the Church of England. He was appointed professor of English literature and history at King's College, London, in 1840, and professor of theology there in 1846. The controversy aroused by his *Theological Essays* (1853) led to his resignation, and for the next few years he devoted himself to literary work and to the principalship of the Working Men's College, St. Pancras, London, which he helped to found in 1854. He had been one of the founders, in 1848, of Queen's College for Women. In 1860 he became incumbent of St. Peter's, Vere Street, London, and in 1866 he was appointed professor of moral philosophy at Cambridge; from 1870 he was incumbent of St. Edward's, Cambridge. He was a colleague of Charles Kingsley in the Christian Socialist movement, an enthusiast for national education, and a friend of all movements for the betterment of the poor. Strenuously denouncing party spirit in religion, he stood apart from all parties in the Anglican Church, but was bitterly attacked for his alleged heretical teaching on the Atonement and eternal life. His works included *The Doctrine of Sacrifice* (1854); *Social Morality* (1869); *Moral and Metaphysical Philosophy* (1871–1872).

MAURICIUS, mô-rĭsh'ĭ-ŭs (in full FLAVIUS

Tiberius Mauricius; also known by English name Maurice), emperor of the Eastern Roman Empire: b. Arabissus, Cappadocia, 539?; d. Chalcedon, Nov. 27, 602. He fought against the Persians during 578–581, and in 582 he succeeded Emperor Tiberius II, whose daughter, Constantina, he married. In 591 he successfully concluded the Persian War by restoring Chosroes II to the throne. He defeated the Avars several times, but was forced to abdicate in 602 when faced by a mutiny of the army on the Danube. He was killed by Phocas, who succeeded him.

MAURISTS, mô'rĭsts, members of the Congregation of Saint Maur, an amalgamation of the Benedictine houses in France early in the 17th century. In 1720 the Maurists possessed in France six provinces, containing 180 abbeys and priories, of which the principal was that of Saint-Germain-des-Pres, Paris. Jansenism seems to have affected some of the convents, and it was alleged that a Masonic lodge was established at Glanfeuil in 1755, over which the prior of the monastery in that place presided. The Congregation was suppressed in 1792. The last superior general with 40 members of his order perished by the guillotine. In their literary work they produced a great number of works of permanent value. Their complete bibliography comprises over 700 works by 220 authors. The Revolution put an end to the work, for which hundreds of volumes and literary documents had been collected. The Bibliothèque Nationale de Paris contains most of this material.

MAURITANIA, mô-rĭ-tā'nĭ-ȧ, territory, French West Africa, north of the Senegal River. It is bounded on the northwest and north by the Rio de Oro (southern zone of Spanish Sahara), on the northeast by Algeria, on the east by the French Sudan, on the south by Senegal, and on the west by the Atlantic Ocean. The greater part of the area of 364,092 square miles consists of sandy desert. Low ranges of hills cross the territory from northeast to southwest; Adrar is a mountainous plateau region near the frontier of Rio de Oro. In the coastal area streams flow through ravines during the rainy season. The territory is administered from Saint-Louis, in Senegal. Most of the inhabitants are nomadic Arabs and Berbers, generally known as Moors; they are Moslems. The people possess large numbers of sheep and cattle. Other resources include gum and salt. Arguin, an island off the north coast some 50 miles below Cape Blanc was discovered by the Portuguese in the 15th century. In 1817 the territory was recognized as within the French sphere of influence, but it was not occupied until after 1900. It became a protectorate in 1903 and colony in 1920; and with adoption of the French constitution of 1946 it was constituted a territory. Pop. (1948 est.) 517,900. See also French West Africa; Mauretania.

MAURITIUS, mô-rĭsh'ĭ-ŭs (formerly Île de France), island in the Indian Ocean 934 miles southeast of the Seychelles and 155 miles northeast of Réunion. The island has a length of 39 miles and maximum breadth of 29 miles, the area being 720 square miles. The British colony of Mauritius consists of the island of that name and several dependencies: Rodriguez (40 square miles), 344 miles east of Mauritius; and scattered coral groups (aggregating 45 square miles) which include Diego Garcia (11 square miles) and Solomon Island (2 square miles).

Topography.—The island of Mauritius is chiefly of volcanic formation and is almost entirely surrounded by coral reefs. There are several small chains of mountains, but none of great height. The principal peaks are the Piton de la Rivière Noire (2,730 feet), in the southwestern part of the island; Pieter Both (2,690 feet); and the Pouce (2,661 feet). There are numerous rivers and streams; they flow generally through deep ravines and their course is broken by many small waterfalls and rapids. None of them are navigable beyond a short distance from the sea. The land rises gradually from the coasts, and the center of the island is composed chiefly of a fertile and picturesque plateau varying in altitude from 1,000 to 1,800 feet. Intense tropical conditions exist in the lowlands; while on the central high tableland and in the elevated eastern and southeastern districts, a milder and more equable climate prevails. A hot season occurs from December to April, and a cool or mild season from June to September. The hottest time is usually experienced during the second half of January, and the coldest during the second half of July or the first days of August. In the lowlands, there is an average maximum daily temperature of 86°F. from December to March, and in the central tableland the temperature is about 11°F. lower. The mean day and the mean night temperature differ by about 6°F. in summer and winter. The most unhealthy feature of the Mauritius climate is the high humidity. In the lowlands it averages between 70 per cent and 80 per cent; on the central plateau this value is still greater by 10 per cent in summer and 13 per cent in winter. Mauritius has an abundant rainfall, in the east and southeast districts the annual rainfall being 75 to 100 inches; on the eastern slope of the central tableland, 125 to 175 inches; in the west and northwest, less than 40 inches of rain each year. Cyclones, numbering about 8 annually, are usually encountered between December and April. Droughts occur almost periodically, and have been known to last from 6 months to 14 months.

Economy.—The indigenous Creoles, descendants of 18th-century French planters, are now outnumbered by the descendants of Indian immigrants; the latter were introduced between 1842 and 1910 to provide laborers for the plantations. Slaves had been emancipated in 1835. French law has been preserved, and both French and English are official languages. Port Louis, on the northwest coast, is the capital and principal port. The town of Curepipe, the next largest, is a health resort in the center of the island. Many of the forest trees are valuable, particularly the black ebony. The principal item of cultivation is sugarcane. There are also considerable acreages of aloe, corn, tea, and manioc; other products include rice, vanilla, coconuts, and spices. Manufactures include rum, soap, tobacco, and matches. The seven government railway lines aggregate 106 miles; there are 730 miles of highways.

History.—When discovered by the Portuguese, probably between 1507 and 1512, Mauritius had no inhabitants, and it showed no signs of ever having been peopled. The Portuguese named the island Ilha da Cirnos (Swan Island),

from the big birds resembling swans found on shore. The first settlers were Dutch, seamen under Admiral Wybrandt van Warwyk landing in 1598 and naming it for Maurice of Nassau, the stadholder; however, colonization did not commence until 1638. The colony did not prosper, and was finally abandoned by the Dutch in 1710. In 1715 the island was formally taken possession of by the French, but it was not actually occupied until 1721, when colonists were sent out on behalf of the French East India Company; it was then named Île de France. Mahé de La Bourdonnais, governor from 1735 to 1746, encouraged sugarcane cultivation and introduced other valuable plants. The French government took over direct control in 1767. Pierre Poivre, the first intendant, introduced cloves and nutmegs, and created a nursery at Pamplemousses which is now the famous Royal Botanical Gardens. British troops commanded by Gen. Sir Robert Abercromby captured the island in 1810, and possession of it by Great Britain was confirmed in 1814 by the Treaty of Paris. Much damage has been done periodically by cyclones. In literature, Mauritius is famous as the scene of Jacques Henri Bernardin de Saint-Pierre's *Paul et Virginie* (1871); and in ornithology, as the one-time home of the dodo. Pop. (1951 est.) 510,000.

Consult Barnwell, P. J., and Toussaint, A., *A Short History of Mauritius* (London 1949).

MAUROCORDATOS. See MAVROCORDATOS.

MAUROIS, mô-rwà′, **André** (pseudonym of ÉMILE SALOMON WILHELM HERZOG), French writer: b. Elbeuf, Seine-Inférieure, July 26, 1885. During World War I he served as liaison officer with the British forces. His first book, *Les Silences du Colonel Bramble* (1918) was a study of British military life. He is best known for his fictionalized biographies, including those of Shelley (1924), Disraeli (1927), Byron (1930), Lyautey (1931), Tourgeniev (1931), Voltaire (1932), Dickens (1934), and Chateaubriand (1938). Among his works of fiction in English translation are *The Conversation of Dr. O'Grady* (1921), *The Weigher of Souls* (1931), and *A Time for Silence* (1942). In 1938 he was elected member of the French Academy and created knight of the Order of the British Empire. During World War II, while France was occupied by the Germans, he resided in the United States, where he wrote *Tragedy in France* (1940) and *Why France Fell* (1941). In 1942 he published the autobiographical *I Remember, I Remember.* Another personal record appeared in *Journal, Etats-Unis* (1946). Also published that year were *La Terre Promise* and a volume of short stories, *Inattendu Toujours Arrive.* His *History of the United States* and *Woman Without Love* appeared in 1948; and in 1950, *Proust: Portrait of a Genius.* A prolific writer with an engaging style, many of his books achieved greater popularity in Great Britain and America than in France.

MAURRAS, mô-rà′, **Charles,** French writer: b. Martigues, Bouches-du-Rhône, April 20, 1868. A graduate of the Catholic college of Aix, he went to Paris where he became a contributor to various periodicals including *l'Evènement,* the *Revue bleue,* and the *Revue encyclopédique.* With Moréas and other writers he founded the *École romain* (1891) and drew up its program. A royalist by conviction, he engaged in bitter campaigns against democratic ideas in such periodicals as *le Soleil, la Gazette de France* and *le Figaro,* becoming the leading spokesman of the neomonarchist group. When *l'Action française* was converted from a semimonthly to a daily in 1908, he was associated with Léon Daudet in its editorial direction. A traditionalist, he was convinced that France could only achieve political stability by a return to the monarchy. His support of the church was not motivated by religious principles but by belief in its social values. He was twice imprisoned in 1936 for violent attacks against the Blum government, and his election to the Académie Française two years later caused considerable controversy. After the fall of France in 1940 he became a staunch supporter of the Vichy government. On Jan. 27, 1945 after a four-day trial at Lyon, having been charged with treason and intelligence with the enemy, he was sentenced to imprisonment for life. He was released on Feb. 9, 1952, to undergo hospital treatment.

Among his outstanding political works are *l'Idée de la décentralisation* (1898); *Trois idées politiques* (1899); *Kiel et Tanger* (1910); and the 4-volume *Conditions de la victoire* (1916–1918). His collected poems are in *la Musique intérieure* (1925). His *Les Amants de Venise* (1902) is a psychological study of George Sand and de Musset.

MAURY, mô′rĭ, **Dabney Herndon,** American army officer and diplomat: b. Fredericksburg, Va., May 21, 1822; d. Peoria, Ill., Jan. 11, 1900. He graduated at West Point in 1846, served in the Mexican War, and during 1847–1852 taught at the United States Military Academy. Joining the Confederate forces at outbreak of the American Civil War, he reached the rank of major general; he commanded a division at Corinth and later headed the Department of the Gulf. From 1886 to 1889 he was United States minister to Colombia. In 1894 he published the autobiographical *Recollections of a Virginian.*

MAURY, mô-rē′, **Jean Siffrein,** French Roman Catholic prelate: b. Valreas, Comtat-Venaissin, June 26, 1746; d. 1817. As a member of the Constituent Assembly during 1789–1891 he courageously upheld the old regime, but in 1792 was forced to seek refuge in Rome. In 1794 he was created cardinal. With the occupation of Rome by French troops in 1798 he fled to St. Petersburg, but the next year returned as ambassador of the exiled Louis XVIII. In 1806 he went back to France, and in 1810 was made archbishop of Paris. At the Restoration in 1814 he fled once more to Rome. There he was arrested and imprisoned for six months. Most notable of his writings was the *Essai sur l'Éloquence de la Chaire* (1777).

MAURY, mô′rĭ, **Matthew Fontaine,** American naval officer and hydrographer: b. Spotsylvania County, Va., Jan. 14, 1806; d. Lexington, Va., Feb. 1, 1873. He was appointed midshipman in the Navy in 1825, and during 1826–1830 he circumnavigated the globe in the *Vincennes.* A stagecoach accident in 1839 lamed him for life, and in 1842 he was appointed superintendent of the Depot of Charts and Instruments (later the

United States Naval Observatory and Hydrographic Office). He conducted researches on ocean winds and currents, and made wind and current charts of the Atlantic, Pacific, and Indian oceans; his *Physical Geography of the Sea* (1855) was the first textbook of modern oceanography. With outbreak of the American Civil War in 1861 he resigned his post to join the Confederate forces. From 1862 to 1865 he was agent of the Confederacy in Britain; and during 1865–1866 he sought to arrange with Emperor Maximilian for the settlement of Confederate veterans in Mexico. He then settled in Britain, but returned to the United States in 1868 to become professor of meteorology at the Virginia Military Institute. Maury Hall, at the United States Naval Academy, is named for him; his birthday is a school holiday in Virginia.

MAUSER, mou'zĕr, **Peter Paul,** German inventor: b. 1838; d. May 29, 1914. He was employed in the royal armory at Oberndorf, and there, with his brother, Wilhelm Mauser (1834–1882), invented a needle gun in 1863. Moving to Liége, Belgium, in 1867, the brothers invented a breech-loading gun which was adopted by the Prussian government in 1871. They purchased the arsenal at Oberndorf to manufacture their weapons, which included a pistol, a revolver, and a repeating rifle. The Mauser magazine rifle was invented by Peter Paul Mauser in the year 1897.

MAUSOLEUM (Greek, *mausoleion*), a tomb or burial place, the name of which is derived from Mausolus, a ruler of Caria, to whom a sumptuous sepulcher was raised by his wife, Artemisia, at Halicarnassus. Mausolus died 353 B.C.; and his wife was so disconsolate that she perpetuated his memory by the erection of his magnificent monument which became so famous as to be esteemed the seventh wonder of the world, and to give a generic name to all superb sepulchers. Its entire height was 140 feet, and the entire circuit 411 feet. It was overthrown, probably by an earthquake, between the 12th and 15th centuries; and when the Knights of Rhodes took possession of Halicarnassus in 1404 they availed themselves of the materials of the mausoleum to erect the fortress of San Pietro. Parts of the frieze were transported to the British Museum in 1846. Other famous mausoleums are that erected at Babylon by Alexander the Great in honor of Hephaestion, equally magnificent with that of Mausolus, though less refined; and the mausoleum of Augustus, built by him in the sixth consulate in the Campus Martius, between the Via Flaminia and the Tiber, the ruins of which are still seen near the church of Saint Roque. One of the obelisks which stood before this superb building was found in the reign of Pope Sixtus V. This mausoleum contained the ashes of Augustus, Marcellus, Agrippa, Germanicus, and of some later emperors. The mausoleum of Hadrian, at Rome, has been known since the addition of a medieval superstructure as the Castel Sant' Angelo. The most beautiful of all mausoleums is the Taj Mahal, at Agra, India, erected by Shah Jahan between 1632 and 1645 to the memory of his favorite wife, Mumtaz Mahall. Notable mausoleums of modern times include that of Napoleon under the dome of the Invalides, Paris; of President Lincoln, in Washington; of Gen. U. S. Grant, Riverside Drive, New York City; and of Nikolai Lenin, in Moscow.

MAUSOLUS, mô-sō'lŭs, ruler of Caria (ancient division of southwest Asia Minor): d. about 353 B.C. With other satraps, he revolted against Artaxerxes II (Mnemon) and made himself virtually independent, capturing much of Lycia, Ionia, and several of the islands of Greece. He removed the capital of Caria from Mylasa (now Milas, Turkey) to Halicarnassus (the modern Bodrum). The latter is the site of his celebrated tomb, erected by his wife, Artemisia. See also MAUSOLEUM.

MAUSTON, môs'tŭn, city, Wisconsin, seat of Juneau County, located in the valley of the Wisconsin River 35 miles west-northwest of Portage; it is served by the Chicago, Milwaukee, St. Paul and Pacific Railroad. The city handles the products of a fertile dairy and farming area, and engages in lumbering. Mauston's original name was Maughstown. Pop. (1940) 2,621; (1950) 3,171.

MAUTHNER, mout'nĕr, **Fritz,** German novelist and philologist: b. Horzitz, Bohemia, Nov. 29, 1849; d. Jan. 29, 1923. He came of a Jewish family. Moving to Prague at an early age, he studied law and in 1876 became a contributor to the *Berliner Tageblatt.* He continued writing for this newspaper in various departments, particularly as dramatic critic, until 1905. While he wrote novels and satiric romances, his greatest work was in the field of philosophical criticism of language as a means of expression. His style was smooth and brilliant.

MAUVAISES TERRES. See BAD LANDS.

MAUVE, mōv, an aniline purple coloring matter, first obtained by W. H. Perkin in 1856.

MAVERICK, măv'ĕr-ĭk, **Peter,** American engraver: b. New York City, Oct. 22, 1780; d. there, June 7, 1831. He learned the art of engraving under his father, and was engaged principally on designs for bank notes. Among his more famous engravings was that of Charles King's portrait of Henry Clay; of Samuel Lovett Waldo's portrait of Andrew Jackson; and of William Dunlap's portrait of Benjamin Moore. He was one of the founders of the American Academy of Design in 1826. His most celebrated pupil was Asher Brown Durand.

MAVERICK, an unbranded animal found straying, especially one appropriated by a chance finder. This term, in common use in the cattle country of the United States, is derived from the name of Samuel Augustus Maverick (1803–1870), a pioneer in Texas from 1835, who owned a cattle ranch of 385,000 acres. Having accepted in 1845 a herd of 400 cattle in payment of a debt, he left them in charge of one of his men. They were neglected and allowed to run wild, and when the calves were born they were of course appropriated by other ranchers and branded with their marks, and so passed to their undisputable ownership. As the ownership of the cattle was determined by the brand, the name mavericks came to be given to all calves caught when straying from the herd. From

this use of the word grew a wider application to anything dishonestly come by.

MAVIS, the Scottish name for the British songthrush or throstle (q.v.), one of the favorite song-birds of western Europe.

MAVOR, James, Canadian economist: b. Stranraer, Scotland, 8 Dec. 1854; d. 31 Oct. 1925. He was graduated from the University of Glasgow. He was for a time editor of the *Scottish Art Review;* in 1888 became professor of political economy at Saint Mungo's College, Glasgow, and in 1892 professor of political economy at the University of Toronto, Canada. He wrote 'Wages Theories and Statistics' (1888); 'Economic Theory and History Tables and Diagrams' (1890); 'Currency Reform' (1891); 'Economic Study and Public and Private Charity' (1892); 'English Railway Rate Question' (1894); 'Railway Transportation in America' (1909); 'Economic Survey of Canada' (1914); 'Applied Economics' (1914); 'A Short Economic History of Canada' (1915).

MAVROCORDATOS, mäv″-rō-kŏr-dä′-tŏs, or **MAUROCORDATOS, Alexander,** modern Greek soldier and statesman: b. Constantinople, Turkey, 15 Feb. 1791; d. Ægina, 18 Aug. 1865. He was a skilful linguist and early schooled in diplomacy. On the outbreak of the Greek war for independence (1821), he devoted his entire fortune to the equipment of a ship and the arming of volunteers. He organized the insurrection in Ætolia and Acarnania, was made president of the National Assembly at Epidaurus, drew up the provisional constitution and signed the proclamation of independence (January 1822). He also became president of the executive council, but resigned in what he believed to be the interests of harmony. In 1833–34, 1841–43, 1844 and 1854–56, he was at the head of the Cabinet and in 1850–54 was Ambassador at Paris. He promoted public education and was a Liberal in politics, being of the British party and opposed to the Russian policy of Giovanni and Augustin Capo d'Istria. He is generally considered the most important leader in the Greek Revolution. Consult Browning, Oscar, 'History of the Modern World' (Vol. I, New York 1912).

MAWSON, Sir Douglas, Australian geographer: b. Bradford, Yorkshire, 1882. He was educated at Sydney University, where he was graduated bachelor of mining engineer in 1901. In the following year he was demonstrator in chemistry there. In 1903 he made a geological exploration of the New Hebrides and lectured at Adelaide University in 1905. In 1908 he became a member of the scientific staff of Sir Ernest Shackleton's Antarctic Expedition and determined the position of the south magnetic pole on Victoria Land. In 1911–14 he was leader of the Australasian Antarctic Expedition to explore Antarctic lands and establish stations for scientific purposes. His discoveries were among the most important made so far in the 20th century. In 1915 he was awarded the founder's medal of the Royal Geographical Society and was knighted in 1914. He has published 'The Home of the Blizzard' (2 vols., Philadelphia 1915) and scientific papers in the transactions of learned societies. For a detailed account of the explorations directed by Mawson see Antarctic Regions.

MAX, mäks, **Gabriel von,** German painter: b. Prague, 23 Aug. 1840. The son of a sculptor, with whom he studied for a time, he soon devoted himself to painting, then went to the Prague Academy under Engerth's teaching, and, after several years at Vienna, became a pupil of Piloty in Munich, where he was professor in the Academy from 1879 to 1883. His work is largely fantastic; he aimed to interpret music, especially that of Beethoven, Mendelssohn and Liszt; and was fond of psychic themes, although occasionally, as in his famous pictures of monkeys, going to an extreme of realism, explained by his earnest belief in Darwin and Haeckel. But he is best known for his historical and figure paintings, which usually show a female figure of some beauty and ethereal charm, with dreamy, longing, sentimental eyes. In such pictures as these the flesh tones are particularly remarkable, being sometimes styled marble-like and due to his early training as a sculptor and again described as a twilight of sentiment, typifying the spiritual. To this class belong 'Spirit Greetings' (1879); 'The Last Token,' now in the Metropolitan Museum, New York (1874); 'Nydia' (1874); 'Veil of Saint Veronica' (1874); 'The Lion's Bride,' in the Museum of Manchester (1875), and many book illustrations, notably those for Schiller's and for Lenau's poems, for Goethe's 'Faust' (the 'Marguerite before the Mater Dolorosa' being especially well known), for Wieland's 'Oberon' and for Uhland's works. Max was ennobled in 1900. Consult Klemt, 'Gabriel Max und seine Werke' (Vienna 1887); Mann, N., 'Gabriel Max, Kunst und seine Werke' (Leipzig 1888); and Meissner (in 'Die Kunst unserer Zeit,' Munich 1899).

MAXENTIUS, mak-sen'shi-us, **Marcus Aurelius Valerius,** Roman emperor: d. 27 Oct. 312. He was the son of Maximianus, and in 306 A.D. was proclaimed Augustus by the prætorians and acknowledged by the people and Senate of Rome, to whom Galerius had become hateful. Severus, sent by Galerius against him and his father, was compelled by Maximianus to retreat to Ravenna and was put to death in 307. Galerius was likewise compelled to retreat and Maxentius, availing himself of an insurrection of the Africans under a certain Alexander, in 311 declared war against Constantine the Great. While Constantine pressed forward into Italy, Maxentius himself remained inactive at Rome and did not go out to meet Constantine till he had passed unopposed across the Apennines. At the great battle fought shortly after, at Saxa Rubra near Rome, Maxentius was defeated and perished in the Tiber as he tried to escape over the Mulvian Bridge. See Constantine; Rome — *History.*

MAXEY, Samuel Bell, American soldier: b. Tompkinsville, Ky., 30 March 1825; d. Texas, 16 Aug. 1895. When Maxey was a child his parents removed to Paris, Tex., where the son was educated until prepared to enter West Point, from which he was graduated in 1846, assigned to the infantry and at once sent to Mexico. He took part in the campaign from Vera Cruz to the City of Mexico and was brevetted for bravery at Contreras. As soon as the war was ended Maxey resigned to begin the practice of law. For 12 years he practised

n Kentucky and Texas. He entered the Confederate service as colonel of the 9th Texas nfantry and was engaged in the campaigns ast of the Mississippi River under A. S. Johnton, Bragg and Joseph E. Johnston. In 1862 ie was made brigadier-general. In 1863 he vas sent to command the Indian Territory. He aised and equipped numbers of troops, kept he Indians friendly to the Confederacy and n 1864 he drove back the Federal general, Steele, who was endeavoring to effect a junction with Banks in the Red River Valley. For his he was made major-general. After the war he was offered a Supreme Court judgeship n Texas but declined. From 1875 to 1887 he vas in the United States Senate. Maxey was in able senator, a member of the prominent committees and an efficient advocate of Western nterests.

MAXIM, Sir Hiram Stevens, Anglo-American inventor: b. Sangerville, Me., 5 Feb. 840; d. London, England, 24 Nov. 1916. As a boy he received his early education in the country schools of Maine. What little spare ime he had after attending to his work on the farm and in his father's workshop was spent n the pursuit of scientific knowledge. When ie was 14 years old he was sent as an apprenice to a carriage builder at East Corinth, Me. Later, while employed in a laboratory in Boson, he perfected his first invention, a method of carbureting air and gas for lighting purposes. His invention was used in many New York hotels. Others of his inventions included electrical devices, improvements on incandescent amps, self-registering current machines and ther similar contrivances. When he was 28 ears old he was employed as a draughtsman n a shipbuilding firm in New York City. While there he invented a locomotive headight, which was used generally. In 1884 Maxim perfected the automatic rifle, or machine un, in which the recoil due to the explosion of one cartridge was utilized to eject the empty hell and at the same time reload the weapon. The inventor was then in England. The government, interested at once in the possibilities presented by the rifle, adopted it. It was the Maxim gun that was an important factor in winning the Egyptian campaign for the English. It is now used by the armies throughout ie world. Closely following came the "disppearing gun," cordite and other smokeless powders, a gun for hurling aerial torpedoes and ie "delayed action" fuse. For many years ir Hiram experimented with aeronautics. In 894 he succeeded in building a heavier-than-air achine. At that time when aeroplanes were nly thought possible, Sir Hiram Maxim criticised the British nation for lack of interest in eronautics and predicted that a bombardment the island from airships was possible. Sir iram held membership in the American Soiety of Civil Engineers, the Royal Society of rts, the British Association for the Advancement of Science and many other bodies. He ecame a naturalized citizen of Great Britain ecause of alleged unfair treatment of his intentions by the American government. Sir iram Stevens Maxim will be remembered as ne of the foremost inventors of his day. In 881 President Grevy of France made him a hevalier of the Legion of Honor. This decotion was followed in 1901 by recognition by the British government, Queen Victoria elevating him to the knighthood.

MAXIM, Hudson, American inventor and engineer: b. Orneville, Me., 3 Feb. 1853; d. 6 May 1927. After an academic education with especial reference to the natural sciences and engineering, he took up the study of medicine; entered the printing and subscription book publishing business at Pittsfield, Mass., in 1883, but gave up the publishing business in 1888 to take up business of ordnance and explosives. He was the first to make smokeless gunpowder in the United States and was the first to submit samples to the government for trial. In 1890 he built a dynamite factory and smokeless powder mill at Maxim, N. J., named for him. It was there that the multi-perforated smokeless powder was developed and perfected under his inventions and patents, which was adopted by the United States government. These patents were purchased by the E. I. du Pont de Nemours Powder Company, of Wilmington, Del., in 1897. He invented the process of making calcium carbide by incandescence of molten carbide conductor, now in general use. In 1901 he sold United States government the secret of the high explosive Maximite invented by him (see Explosives); invented United States service detonating fuse for high explosive projectiles. He invented the system of driving torpedoes by steam and products of combustion of a self-combustive compound called motorite, the steam being generated by the motorite. This system was purchased by the United States navy. In 1898 he became consulting engineer for E. I. du Pont de Nemours Powder Company. He invented stabillite (q.v.), a smokeless powder made without volatile solvent, which consequently requires no drying. He received the degree of D.Sc. from Heidelberg University, Ohio, in 1913. He was a member of consulting board of United States navy; of Albany Burgesses Corps (rank, captain); of Military Service Institution; of Society of Chemical Industry; of Chemists Club; of Aeronautical Society; Fellow A. A. A. S., of Society of Applied Psychology. He published 'The Science of Poetry and the Philosophy of Language' (1910); 'Defenseless America' (1915); 'Dynamite Stories' (1916).

MAXIMA AND MINIMA. The maxima and minima of a function $f(x)$ are the points of the curve $y=f(x)$ where y is larger or smaller, respectively, than for any value of x differing from the value at that point by less than some finite number. According to this definition, a curve may have several maxima or minima, and a maximum or minimum need not be a point where y assumes the greatest or least value, respectively, throughout the entire curve. It is easy to see that a maximum is a point where the curve ceases to go up and begins to go down. At such a point, the slope of the curve, or the differential coefficient $\frac{dy}{dx}$, changes sign. If $\frac{dy}{dx}$ is continuous at a maximum, it can only be 0, and at any rate, on an algebraic curve, it can only be 0 or ∞. Thus the maxima — likewise the minima — are all to be found among the points where $\frac{dy}{dx}=0$ or ∞.

If $\frac{d^2y}{dx^2} > 0$, we have a minimum, of $\frac{d^2y}{dx^2} < 0$, a maximum. However $\frac{dy}{dx}$ may be 0 or ∞ without their being a maximum or minimum at the point. In this case $\frac{d^2y}{dx^2}$ will be 0. To determine whether we have a maximum, a minimum or neither when $\frac{d^2y}{dx^2}=0$, higher derivatives must be considered.

The definition of the maxima and minima of a function of two variables is obvious. It is clear that a necessary condition for a maximum or minimum of $f(x, y)$, at a point where its partial derivatives are continuous, is that $\frac{\partial f}{\partial x} = \frac{\partial f}{\partial y} = 0$. A sufficient condition for a maximum is $\left(\frac{\partial^2 f}{\partial x \partial y}\right)^2 < \left(\frac{\partial^2 f}{\partial x^2}\right)\left(\frac{\partial^2 f}{\partial y^2}\right)$ and $\frac{\partial^2 f}{\partial x^2} < 0$. A sufficient condition for a minimum is $\left(\frac{\partial^2 f}{\partial x \partial y}\right)^2 < \left(\frac{\partial^2 f}{\partial x^2}\right)\left(\frac{\partial^2 f}{\partial y^2}\right)$ and $\frac{\partial^2 f}{\partial x^2} > 0$.

Some important theorems in plane geometry having to do with maxima and minima are that of all polygons having a given perimeter and a given number of sides the regular one has the greatest area; that a circle has a greater area than any other figure with the same perimeter; that a right triangle is larger than any other with two sides equal to its legs, and that of all triangles with a given perimeter and a given base, the isosceles is the greatest. See CALCULUS, THE INFINITESIMAL; CALCULUS OF VARIATIONS.

MAXIMALISTS, or BOLSHEVIKI, the name applied to the adherents of the extreme Socialist party which, headed by Lenin and Trotzky, overthrew the provisional government and the Soviet leaders in Russia on 7 Nov. 1917. The words «Bolshevik» (sing.), «Bolsheviki» (plural) and «Bolshevism» are not explanatory terms and have nothing to do with the policy or aims of the party. Their origin dates from the second conference of the Russian Social-Democratic party in 1903, at which the methods to be adopted in regard to revolutionary activity were under discussion. A sharp line of cleavage made itself evident; and when voting on the resolutions took place there was naturally a majority (bolshinstvó) and a minority (menshinstvó). From that moment the groups were called Bolsheviki and Menshiviki (maximalists and minimalists). The majority represented the extremists, the «whole-hoggers» of Socialism (bólshĕ — more), or those who go for the biggest things; while the minority represented the «moderates» or «thin-end-of-wedge» theorists (ménshi — less, smaller), or those whose aims are of smaller intent. There appears to be no evidence that the terms existed or were current before 1903, though the Russian Social-Democratic party was founded by Plekhanov and others in Switzerland in 1884. The abortive revolutionary movement of 1905–06, which opened with the Putilov ironworks strike and the Father Gapon episode, served to widen the breach between the two factions to the extent that in 1907 the party was definitely split into two independent groups — Bolsheviki and Menshiviki. The former, following in part the teachings of Karl Marx, were led by Lenin. The Marxian revolution was essentially a class revolution, to the realization of which nationalism was regarded as an obstacle. The European War and the aftermath of the Revolution of March 1917 revealed the wide divergence existing between the aims and methods of the two groups. The Bolsheviki contracted the class distinction to narrower dimensions and looked upon the educated classes, the *bourgeoisie,* and even the peasants as enemies. Their aim was radical internationalism; they sought not the re-creation of Russia, but the triumph of one class throughout the world — the proletariat; in other words, mob-rule. For the most part they were bitter and arid doctrinaires, reeling off strings of long, high-sounding words and phrases which few understood, and clinging to a vague and abstract creed with fanatical devotion. Every problem was met by a reference to the letter of their law and interpreted accordingly. But whatever political, social or economic creed the Bolsheviki professed on paper, their activity — and by that alone can they be judged — consisted merely of a wild orgy of crime, plunder and treason. No trace of practical ability was revealed by any of their leaders, but they had the driving force which even the shallowest fanaticism can give. They were opposed to the war, which they declared to be «imperialistic» and «bourgeoise.» They were opposed (on principle) as much to a German peace as to a peace dictated by the Allies: «No indemnity, no reparation and no annexation» became their ideal. The Menshiviki were of a saner type; while claiming for the working classes the importance due to their numbers, they did not ignore other classes. Holding in view definite practical reforms, they were willing to utilize the existing machinery of the state for their purpose. They accepted the war and its vigorous prosecution as a part of their program and realized that nationalism must precede internationalism. They recognized that the cause of the Allies was also their cause, and in this belief they were undoubtedly supported by the more intelligent Russian Social-Democrats. To the Bolsheviki the fate of their country mattered nothing, provided only that their own crude ideas of social reconstruction survived the ordeal. They were eager for peace on any terms in order that they might proceed with their own program, that class war which recognized no political frontiers nor national consciousness. After the fall of Kerensky the Bolsheviki began their career as rulers by the wilful and systematic destruction of the Russian army and navy. Their leaders posed before the world as the elect champions of a new idealism which was to redeem mankind. They proposed to teach other democracies the true and saving doctrine of the real revolutionary creed. Of exercising government, as that term is understood among civilized peoples, they proved themselves utterly incapable; government, in fact, holds no place in their system, of which the sole principle is civil war or, as they term it, «class war.» Though it owes its genesis to Socialism (from which it is really far removed), Bolshevism may be described as a com-

ound of anarchism, syndicalism, hatred and ind fanaticism. Needless to say, ingredients f this type cannot fail to attract all the purely riminal elements which, in normal times, are eld in check by the forces of law and order. Vith the removal or breakdown of that salutary neck and the absence of an efficient substitute, free rein is given to unbridled passions by hich a political movement is converted into mere carnival of terrorism. This was what appened in Russia in 1917. The Bolsheviki ad nothing whatever to do with bringing about ie revolution which swept away the autocracy March of that year. That revolution was either engineered nor organized; it sprang ot from the burning inspiration of a new ith, but succeeded almost automatically from neer weariness: tired in mind and body, Rusa had lost nerve and heart. The provisional overnment that was formed on 16 March conisted of honest, patriotic and intelligent men—rince Lvov, Guchkov, Milyukov, Terestchenko, ekrasov, Shingarev and Kerensky, who was ie only Socialist in the group. Of all these, erensky proved to be the only «man of desny» with sufficient magnetism to compel a llowing. Their first energies were devoted maintaining discipline in the army and carving the war to a successful conclusion. But ready in September 1915 Lenin had issued ie Zimmerwald manifesto, signed by himself id the Swiss Socialist, Robert Grimm, callg for «peace without annexations or indemties.» German agents had sedulously spread is doctrine among the Russian rank and file, ith the result that the idea of a peace so sily to be gained soon won a large number converts. It was easy for German propandists to convert the working classes to this ew. The people were told what they wanted hear — that it was folly to fight longer and at their Western Allies were the true foes of ussia, since they sought to force her to reain in the war. Not only did demoralization the army set in, but there also grew up spirit of hostility against the Allies, especially Great Britain. Thus, while the provional government and later Kerensky alone ruggled to maintain order and national unity, olsheviki and German agents were underming the structure with glowing promises and dition. On 16 July 1917 the Bolsheviki in etrograd, led by Lenin and Trotzky, atmpted to seize the reins of government and iled. Lenin disappeared when warrants were ued for the arrest of the Bolshevist leaders. the last moment Kerensky weakened; rerding the Bolsheviki as «political opponents,» countermanded the order for their arrest. Up to this time the Russian armies were ll fighting in the field; their offensive in alicia was nearing its disastrous climax and olshevism—the foe of the revolution and enemy of the people—was growing in moentum. Confusion spread; Kerensky deunced the counter-revolutionists and those o unwittingly encouraged anarchy (Moscow, Aug. 1917), which caused a wider split ong his uneasy team. General Korniloff arred from the front and stated that the mili-y disasters were due not to the revolution t to the follies of the revolutionaries; that cipline must be maintained both at the front d in the rear. His gloomy picture of a degraded and defeated Russia had no terrors for the Bolsheviki. After three days of palaver the conference talked itself to a standstill with no result. Meanwhile, the German armies found no difficulties in overrunning northern Russia and seizing Riga. Kerensky again wavered. His fatal error in the Korniloff affair drove the few remaining moderates out of his Cabinet and gave the Bolsheviki their opportunity. The retreating Russian armies gave themselves up to pillaging their own people and the sailors of the Baltic fleet murdered their own officers. Lenin crept out of hiding and raised his voice afresh in Kronstadt—the worst nest of anarchy. Kerensky once more fulminated against the Bolsheviki and then informed the United States that Russia was worn out. The dark forces waiting in the shadows quickly observed the change and made their preparations. The apathy and despair of Russia made her an easy victim to a body of determined men. Trotzky, then president of the Petrograd Soviet, summoned the proletariat of all nations to do what had been done in Russia; he decided to make peace with a willing Germany and to raise his party to the supreme power. On 5 Nov. 1917 the Military Revolutionary Committee ordered the Petrograd garrison to place itself under their instructions. Kerensky suppressed the chief Bolshevist paper and called on the loyal troops to defend the government. On the 6th the military cadets occupied stations, bridges and telegraph offices and threw a cordon around Kerensky's residence, the Winter Palace. Lenin arrived the following day with his leading spirits and made the Smolny Institute (a girls' school) the Bolshevist headquarters. He issued a proclamation announcing the fall of the government. The majority of the troops went over to the Bolsheviki. Kerensky fled on the 7th, leaving a guard of cadets and some women at the Palace. The Bolshevist troops (Red Guards) captured the palace, committed many brutalities on the inmates and in a few hours the whole of Petrograd was in their hands. The «new government» was placed in the control of a «Council of People's Commissioners,» of which Lenin was appointed president, Trotzky foreign minister and Ensign Krylenko as commander-in-chief of what was left of the army.

The comparative ease with which the Bolsheviki overturned the provisional government was due mainly to the passive attitude of the troops. Had Kerensky had at his disposal a few brigades of reliable troops he might as easily have crushed Bolshevism on the same day. On 8 November Lenin telegraphed to all the belligerent governments a proposal for a three months' armistice. On the 10th a series of decrees began to emanate from the Smolny Institute, their principal features being the spoliation of one class and the transference of its property to another. Municipalities were empowered to sequestrate all houses, whether inhabited or not, and to install in them citizens possessing no abode or occupying crowded or insanitary dwellings. All factories were passed to the possession of the operatives (syndicalism), and a moratorium was proclaimed for the payment of rent for small houses and lodgings. The most important decree threatened civil war in the rural districts by declaring all private ownership in land to be annulled without com-

pensation to the owners. The land was to be nationalized and handed over to the cultivators, while for the present all lands belonging to the state, to the Church and to monasteries, etc., with all appurtenances — flocks, herds, machines, etc., were to be placed at the disposal of the 'local agrarian committees until the meeting of the Constituent Assembly. The local soviets were authorized to preserve order during the process of confiscation. All mines, forests and waterways were acquired by the state, and the smaller woods, rivers and lakes were to be the property of the village communes. The gloom of Bolshevism had settled over Russia. Missionaries of that cult were dispatched to all European countries and to the United States to spread the faith and incite proletariat uprisings, though with negligible success. During 1918–21 the dread of "Bolshevism" became a haunting spectre to not a few governments. Everywhere outside of Russia it was denounced by public men and its slightest symptoms rigorously suppressed. It is a remarkable fact that, while Jews formed a large percentage of the leading Bolsheviki, over 90 per cent of Russian Jews were hostile to them. Many of them had lived in America, Switzerland, Great Britain, France, Germany and the Scandinavian countries. They returned to Russia after the Revolution, where their ranks were swelled by large numbers of exiles from Siberia — not all political offenders, but also some of the most dangerous criminals. (The further adventures of the Bolsheviki régime are told under RUSSIA—HISTORY; see also RUSSIA—DURING THE WORLD WAR; WAR, EUROPEAN; KERENSKY; KORNILOFF; TROTZKY; LENIN). Consult Trotzky, L., 'The Bolsheviki and World Peace' (New York 1918); *The World's Work* (New York, October 1918); *Current History* (New York, November–December 1918).

MAXIMIANUS I, măk-sĭm-ĭ-ā'nŭs, **Marcus Aurelius Valerius,** Roman emperor: d. February 310 A. D. He so approved himself by his services in the army that Diocletian selected him for his colleague, creating him first Cæsar (285), then Augustus (286) and at the same time conferred on him the honorary appellation of Herculius. Maximianus had the care of the Western Empire, while Diocletian undertook that of the Eastern. In 287 he was consul with Diocletian, and in the same year conducted a campaign in Gaul. After conducting several wars, in 303–304 he was for the seventh time made consul, having for his colleague Diocletian for the fifth time, with whom he abdicated 1 May 305. In the following year he was again invested with the imperial title by his son Maxentius, to whom his services against Severus and Galerius were of the most important kind. His son shortly after expelled him from Rome, and repairing to Gaul, in 308 caused himself to be proclaimed Augustus at Marseilles, but Constantine easily deposed him. See CONSTANTINE; DIOCLETIAN.

MAXIMILIAN I, măk-sĭ-mĭl'ĭ-ăn (Ger. măks-ē-mē'lē-ăn), emperor of Germany: b. Neustadt, near Vienna, 22 March 1459; d. Wels, in Upper Austria, 12 Jan. 1519. He first became an independent prince by his marriage with Mary of Burgundy, the daughter of Charles the Bold, who died in 1477. This match involved him in a war with Louis XI, King of France, in which he was successful, though he was defeated at a later period by the Milanese. At Frankfort in 1486 he was chosen king of the Romans and two years later was imprisoned by the Flemings at Bruges. He secured the Tyrol in 1490 and in the same year made war against Charles VIII of France. In 1493 he became Holy Roman emperor on the death of his father. He was involved in war with Venice, France and Switzerland for the greater part of his reign. He was succeeded by his grandson, Charles V. Consult 'Cambridge Modern History' (Vol. I, 1903), and Heyck, 'Kaiser Maximilian I' (Bielefeld 1898).

MAXIMILIAN, emperor of Mexico, known in earlier life as Ferdinand Maximilian Joseph, Archduke of Austria: b. Vienna, 6 July 1832; d. Queretaro, Mexico, 19 June 1867. He was the younger brother of Francis Joseph I, emperor of Austria (q.v.). He entered the Austrian navy in 1846, and in 1854 obtained the rank of rear-admiral and was placed at the head of the Austrian marine. He was viceroy of the Lombardo-Venetian kingdom in 1857–59, and in 1857 married Princess Charlotte of Belgium, daughter of King Leopold I. On his return from a voyage made to Brazil for scientific purposes he fixed his residence at Miramar in the vicinity of Trieste, and there, 3 Oct. 1863, received a deputation from the Mexican Assembly of Notables, who offered him the crown of their country. He officially announced his acceptance 10 April 1864. He landed at Vera Cruz on 28 May and entered Mexico on 12 June. He set himself energetically to consolidate and develop his dominions, granted an amnesty to political offenders and exhibited great interest in religious worship and education. But he failed to conciliate the Republican party, and as he did not restore to the clergy their confiscated estates they pronounced him a traitor. Meanwhile there were incessant conflicts between the partisans of President Juarez and the allied French and imperial troops; and the decree of 2 Oct. 1865, by which the members of the Juarist bands and those who abetted them were to be regarded as bandits and shot, alienated the party of the Liberals. Juarez raised the standard of independence. Complications and misfortunes thickening around Maximilian rendered his position critical in the extreme. The empress in vain undertook a mission to Europe to enlist support for her husband, and grief and disappointment overthrew her reason. The French troops, largely by reason of the representations of the United States government, were withdrawn by Napoleon in March 1867; but Maximilian decided to remain in the hope of being able to maintain the empire. While bravely defending Queretaro against a Liberal force under Escobedo, he was betrayed by General Lopez on the night of 14 May 1867. Tried by court-martial, he was sentenced, with his principal officers, to be shot. The sentence was carried into effect on the morning of 19 June. Maximilian's body was after some delay surrendered to his relatives, and his funeral was celebrated with great pomp in the cathedral of Vienna on 18 Jan. 1868. Maximilian was a man of eminent abilities and high and varied culture. His collected writings are contained in a posthumous publication entitled

'Aus meinem Leben: Reiseskizzen, Aphorismen, Marinebilder' (1867), which gives ample testimony to the vigor of his intellect and the variety of his attainments. (See MEXICO, *History*). Consult Bancroft, H. H., 'History of Mexico' (6 vols., San Francisco 1883–88); 'Cambridge Modern History' (Vol. II, New York 1909); Kemper, J., 'Maximilian in Mexico' (Chicago 1911); Martin, P. F., 'Maximilian in Mexico' (London 1914).

MAXIMILIAN, Joseph, 1st king of Bavaria: b. Schwetzingen, Baden, 27 May 1756; d. Nymprenburg, near Munich, 13 Oct. 1825. He succeeded his uncle, Charles Theodore, as elector in 1799. He was a supporter of Napoleon, and gave his daughter in marriage to Eugene Beauharnais in 1806. In the same year his duchy was erected into a kingdom. In 1813, however, he was member of the league against the emperor, and thus retained his throne after the fall of Napoleon. His reign was distinguished by the introduction of many administrative reforms, especially the constitution of 1818.

MAXIMINUS, măk-sĭ-mī'nŭs, **Caius Julius Verus,** Roman emperor: d. Aquileia, 238 A.D. He was at first a shepherd in Thrace and when about 20 years of age became a soldier in the Roman armies, where he was distinguished by his gigantic stature. His capacity for fighting procured him rapid advancement, and under Alexander Severus he had the command of a legion on the Rhine. In 235 A.D. he took part in a conspiracy against Alexander, and after his murder of the latter by the soldiers was proclaimed emperor. The Gordiani having been proclaimed in Africa, Maximinus hastened to Italy and laid siege to Aquileia. He was there murdered by his soldiers.

MAXIMITE, a high explosive employed as a bursting charge for projectiles, invented by Hudson Maxim (q.v.) of New York City. The secret of the invention and the exclusive right to the use of the explosive was purchased by the United States government in 1901, after very exhaustive trials at Sandy Hook proving grounds. Maximite was the first high explosive to be successfully employed as a bursting charge for armor-piercing projectiles. This explosive, while it is claimed to be 50 per cent more powerful than ordinary dynamite, is so insensitive that it will not only safely withstand the shock of discharge from the gun, but will also stand the far greater shock of penetrating armor-plate as thick as the projectile containing it is capable of passing through, the projectile being then exploded immediately behind the plate with a delay action detonating fuse.

Ignited in the open, maximite simply burns like pitch. Projectiles are charged with it by the simple process of melting and pouring, the explosive solidifying on cooling, and adhering firmly to the walls of the shell. Maximite is known to be a picric acid compound. See EXPLOSIVES; PROJECTILES.

MAXIMS. The 'Maxims' of La Rochefoucauld furnish the most famous body of examples of that polished and studied condensation of expression to epigrammatic sparkle and brilliance in which the French so delight and so excel, and of which the 'Pensées' of Pascal, the 'Caractères' of La Bruyère and the 'Reflexions' of Vauvenargues are other specimens. They are precisely what their fuller official title proclaims them: Reflections, or Sentences and Moral Maxims ('Réflexions, ou Sentences et Maximes morales'). They are moral in the sense that they are concerned with the facts of human conduct and motive, but not at all in the sense of serving a didactic purpose or in proposing an incentive or a guide to virtuous living; and they are reflections rather than maxims in the ordinary meaning of the word, since what they give us is not practical precept and counsel, but an analysis of moral facts. In this analysis the sharp distinction and opposition between vice and virtue disappears. His moral philosophy is summed up in the maxim that stands as epigraph at the head of the collection: "Our virtues are most frequently but vices disguised." The idea is restated a little more specifically in the first reflection: "What we term virtue is often but a mass of various actions and divers interests which fortune, or our own industry, manage to arrange, and it is not always from valor or from chastity that men are brave, and women chaste." The root of all our actions, mask it as we will, is selfishness. This view of virtue and vice may owe something of its bitterness and pessimism to the personal temper of La Rochefoucauld, soured by disappointment after playing a restless and unsuccessful part in political and private intrigue. But it owed much also to his penetrating observation of the life of court and salon, and even those who wanted to think more generously of human nature admitted sadly the accuracy of his analysis, while all were captivated by the concision and elegance of his style. To this he gave unending care, polishing and refining his sentences, rejecting some and adding others in successive editions (1665, 1666, 1675, 1678). The standard edition is that prepared by M. Gilbert (Paris 1868). The Maxims have had many admirers among English writers, as Addison, Swift, Dr. Johnson and Lord Chesterfield. They have often tempted to translation. A late and complete English version is by J. W. Willis Bund and J. Hain Friswell (London 1871).

ARTHUR G. CANFIELD.

MAXIMS, Legal, epigrammatic statements of established principles in law, as "Ignorance of the law excuses no one" (*Ignorantia legis neminem excusat*). They are of historic and practical value, and are common in both law and equity. Usually they are given in Latin or in English, but occasionally they appear in French. The following are some of the most important which appear generally in English: "Equity treats that as done which ought to be done"; 'He who comes into equity must come with clean hands"; "Who seeks equity must do equity"; 'Acts indicate the intention"; "Where there is equal equity, the law must prevail." The following usually appear in Latin: *Qui facit per alium facit per se* ("He who acts through another acts himself"—important in the law of agency); *Affirmantis est probare* ("He who affirms must prove"); *Causa proxima non remota spectatur* ("The immediate and not the remote cause is to be considered"—important in the law of torts). While maxims are of importance in the law to-day, it is nevertheless true that some of them, through legal changes, are practically obsolete. Due

allowance also must be made for the fact that they do not contain exceptions and amplifications of the principles they state; otherwise they are very likely at times to be misleading.

MAXIMUM DUTIES. See DUTY.

MAXIMUS MAGNUS, Roman emperor: b. in Spain; d. 388. In 383, while commanding the Roman army in Britain, he proclaimed himself emperor. Gratian marched against him, but was defeated and assassinated, and Maximus, having made himself master of Gaul, Britain and Spain, fixed the seat of his empire at Treves. He then advanced into Italy and was besieged in Aquileia by the Emperor Theodosius, who caused him to be beheaded.

MAXWELL, SIR Herbert Eustace, 7th Baronet of Monreith, Scottish author: b. Edinburgh, 8 Jan. 1845. He was educated at Oxford, was Conservative member of Parliament for Wigtownshire, 1880–1906, and president of the Society of Antiquaries of Scotland, 1900–13. Among his many publications are 'Noontide Essays' (1892); 'Scottish Land Names' (1894); 'Rainy Days in a Library' (1896); 'Life of the Duke of Wellington' (1899); 'Memories of the Month's' five series (1900–09); 'The House of Douglas' (1901); 'Memoirs of George Romney' (1902); 'The Creevy Papers' (1903); 'A Century of Empire' (1909–11); 'The Making of Scotland' (1911); 'Flowers, A Garden Notebook' (1923); 'Inter Alia' (1925).

MAXWELL, James Clerk-, Scottish natural philosopher: b. Edinburgh, 13 Nov. 1831; d. Cambridge, England, 5 Nov. 1879. He was educated at Edinburgh and at Trinity College, Cambridge, and in 1856 was appointed professor of natural philosophy in the Marischal College, Aberdeen, and held that office till its amalgamation with King's College to form the University of Aberdeen in 1860, when he was appointed to a similar chair in King's College, London. In 1857 he obtained the Adams prize at Cambridge for an essay 'On the Stability of Motion of Saturn's Rings.' From 1855 to 1872 he published his investigations on 'Perception of Color, and Color Blindness,' which obtained for him the Rumford medal and his election as F.R.S. He resigned his chair in 1865 and in 1871 was elected unopposed to the newly-founded chair of experimental physics at Cambridge. He directed the formation of the Cavendish laboratory founded by the Duke of Devonshire and opened in 1874. In 1871 he published his 'Theory of Heat,' which has gone through several editions. In 1873 appeared his great work, 'Electricity and Magnetism.' Maxwell's fame will rest on his being the one who took the first grand step toward the discovery of the true nature of electrical phenomena. He rejected the theory of electrical "action at a distance," and sought to explain all electrical and magnetic phenomena as the results of local strains and motions in a medium whose contiguous parts only act on one another by pressure and tension. His scientific papers have been collected by W. D. Niven (1890). Consult Campbell and Garnett, 'James Clerk Maxwell' (London 1882); Glazebrook, R. T., 'James Clerk Maxwell and Modern Physics' (ib. 1896).

MAXWELL, William Henry, Irish-American educator: b. Stewartstown, Tyrone, Ireland, 5 March 1852; d. 3 May 1920. He was graduated at Galway Queen's College in 1872 and in 1874 received the degree of A.M. In 1874 he came to the United States. After eight years as teacher in Brooklyn he became assistant superintendent of schools in that city in 1882 and superintendent from 1887 to 1898. After 1898 Dr. Maxwell was superintendent of public schools of Greater New York. In this position he often came into conflict with members of the board of education. He advocated a college training for teachers and raised the requirements for teachers' examinations in New York. He was president of the National Education Association in 1905. Dr. Maxwell was always very deeply interested in the promotion of the study of English. He published 'Elementary English Grammar'; 'School Grammar' and other educational works.

MAY, Phil, English illustrator: b. Leeds, 22 April 1864; d. Saint John's Wood, London, 5 Aug. 1903. He was son of an engineer; had his schooling in Leeds; was apprenticed there to a lawyer, whom he soon left to join a company of players; for them he designed posters, married at the age of 19; and in 1884 and 1885 began drawing for *Society* and *Saint Stephen's Review.* He went out to Sydney, Australia, in 1885, where he gained some fame as artist of the *Bulletin,* and was forced by the exigencies of newspaper illustration to a very scanty use of line and a complete omission of anything else; went to Paris; returned to his work on *Saint Stephen's Review;* then began to draw for the *Daily Graphic;* in 1888 returned to England; thereafter traveling through America and shortly after Du Maurier's death was taken on the staff of *Punch.* He must rank with Leech, Tenniel and the other great British caricaturists. His art was remarkably simple and telling, his method, it is said, being to reduce an elaborate and detailed drawing to the fewest possible lines. He was particularly happy in his portrayals of London street-life, which are full of humor and sympathy; his Parliament sketches are less felicitous and a misapplication of his talent. His own hatchet face, "banged" hair and ever-present cigar figure in many of his sketches. From 1892 to his death he published 'Phil May's Annual.' His other collections of drawings are 'Parson and Painter' (1891); 'Phil May's Sketch Book' (1895) and 'Phil May's Gutter-Snipes' (1896); 'Phil May's Graphic Pictures' (1897).

MAY, Samuel Joseph, American reformer and abolitionist: b. Boston, Mass., 12 Sept. 1797; d. Syracuse, N. Y., 1 July 1871. He was graduated at Harvard in the class of 1817, and after studying theology under Dr. Ware at the Harvard Divinity School became a Unitarian clergyman and in 1822 accepted a call to a church at Brooklyn, Conn. He was interested in the anti-slavery cause and preached as well as wrote in favor of it, advocating immediate emancipation, for which he was mobbed and burned in effigy at Syracuse in 1830. He was a member of the first New England Anti-Slavery Society, formed in Boston in 1832, and eagerly championed Prudence Crandall, when she was persecuted and arrested for receiving colored girls into her school at Canterbury, Conn. Mr. May was also a member of the Philadelphia convention of 1833 which formed the American

Anti-Slavery Society, and was one of the signers of the "Declaration of Sentiments," the author of which was William Lloyd Garrison. For 18 years he was the general agent of the Massachusetts Anti-Slavery Society, and as such lectured and traveled extensively. He was five times mobbed while on a lecture tour in Vermont, in 1835, once while lecturing in the capitol at Montpelier. He had charge of the Unitarian church at South Scituate, Mass., from 1836 to 1842, becoming in the latter year, at the request of Horace Mann, the principal of the Girls' Normal School at Lexington, Mass. In 1845 he became pastor of the Unitarian Society at Syracuse, N. Y., which position he retained until 1868. Mr. May assisted in the rescue of Jerry, the slave, in 1851, and with several others was arrested for this offense against the Fugitive Slave Law. May and his associates issued a declaration in which they admitted the fact of their being implicated in the rescue, but claimed that the Fugitive Slave Law was unconstitutional and wicked. Realizing the changing sentiment in the North the authorities never brought the case to trial. May's life, like that of many another Abolitionist, was often in danger. He was among the most conservative anti-slavery leaders in his methods and was prominent also in many educational and charitable enterprises, and did a great deal toward improving the public-school system of Syracuse. By his associates May was termed the Saint John Apostle of the Gospel of Freedom, on account of his gentle voice and manner. He was both gentle and firm, courageous, unwearied and unselfish in the anti-slavery cause. He published 'Education of the Faculties' (1846); 'Revival of Education' (1855); 'Recollections of the Anti-Slavery Conflict' (1868). Consult Mulford, 'Memoir of Samuel Joseph May' (Boston 1873; new ed., 1882).

MAY, Thomas, English dramatist and historian: b. Mayfield, Sussex, 1594; d. London, 13 Nov. 1650. He was educated at Cambridge, became a member of Gray's Inn, but never practised, and figured brilliantly at court. He published 'Antigone,' 'Cleopatra,' 'Agrippina' and other dramas and translations of the 'Georgics' and Lucan's 'Pharsalia.' He was an intimate of Charles I and at the latter's behest wrote histories of Edward III and Henry II in verse. He espoused the cause of Parliament in the Civil War, was made secretary and historiographer to Parliament and wrote 'History of the Parliament of England, 1640–43' (1650; several times republished), and a 'Breviary' of the same history (1650). Until the Restoration his body reposed in Westminster Abbey, but as in the case of other Parliamentarians, it was then dishonored and thrown into a neighboring pit.

MAY, Thomas Erskine, Baron Farnborough, English historian: b. London, 8 Feb. 1815; d. Westminster, 17 May 1886. He was educated at Bedford Grammar School, became assistant librarian to the House of Commons in 1831 and was called to the bar in 1838. He was appointed examiner of petitions for private bills in 1846 and clerk to the House of Commons in 1871. He was knighted in 1866, and just prior to his retirement from office in 1886 was raised to the peerage. He is best known as an antiquarian and historian. His chief works are 'A Practical Treatise on the Law, Privileges, Proceedings, and Usages of Parliament' (1844; 10th ed., much enlarged, 1893), a model of its kind, which has been translated into most modern languages; 'Constitutional History of England since the Accession of George III, 1760–1860' (1861–63; republished with supplementary chapter, 1871); 'Democracy in Europe: a History' (1877). In 1854 he collected and reduced to writing the 'Rules, Orders, and Forms of Procedure of the House of Commons.'

MAY, the fifth month of the year, having 31 days. It was second in the old Alban calendar, third in that of Romulus and fifth in that of Numa Pompilius. The etymology of the word is doubtful. It was called Maius by Romulus, in respect to the senators and nobles of his city, who were called Majores, as the month following was called Junius, in honor of the youth of Rome who served him in war and were named Juniares. Some etymologists are of opinion that it was called Maia, from the goddess of that name, the mother of Mercury, to whom they offered sacrifices on the first day of the month. The sun enters Gemini during May and the plants of the earth generally begin to flower. See Calendar.

MAY APPLE. See Mandrake.

MAY BEETLE, or JUNE BUG, popular names for the clumsy brown beetles of the genus *Lachnosterna* (family *Scarabæidæ*) common throughout the United States. The adults fly by night during late spring and often are troublesome upon the young foliage of trees and shrubs. They are attracted by light and may be trapped in this way. The larvæ are large, brown-headed, white-bodied grubs which feed upon the roots of grass, etc., passing one or more years in the ground. For this reason strawberries and other crops which they attack should not be planted upon freshly-turned sod land. Late fall plowing is often practised to destroy them.

MAY-BIRD, a gunner's name for various shore birds which return from the South in the month of May, especially the knot (q.v.). In New England the black-bellied plover, and in the South a curlew, are called May-birds or May-cocks.

MAY CHERRY, a local name for the service-berry bush. See Amelanchier.

MAY DAY, popular name of the first day of the month of May, on which from a very early period general festivities took place. May has generally been regarded as a time for gladness. The outbreak into new life and beauty which marks nature instinctively excites. The first emotion is a desire to seize some part of that profusion of flower or blossom which spreads around, to set it up in decorative fashion and to let the pleasure which it excites find expression in dance and song; and among pagans the tendency has been to render to this vegetative trophy a sort of homage. Among the Romans, the feeling of the time found vent in their *Floralia*, or Floral Games, which began on 28 April and lasted to 3 May. Among the old Celtic peoples, a festival called *Beltein* (Baal's fire) also was held on this day, but it does not seem to have been connected with flowers, but rather with sun-worship. In Christian times in the Celtic countries the Church

Christianized this celebration by transferring it to June 24, the feast of St. John, which is still celebrated with bonfires.

In England, as we learn from Chaucer and other writers, it was customary during the Middle Ages for all, both high and low—even the court itself—to go out on the first May morning at an early hour "to fetch the flowers fresh." Hawthorn branches also were gathered and were brought home about sunrise, with accompaniments of horn and tabor. The people then proceeded to decorate the doors and windows of their houses with the spoils. By a natural transition of ideas, they gave the hawthorn bloom the name "the May"; they called the ceremony "the bringing home the May"; they spoke of the expedition to the woods as "going a-Maying." The fairest maid of the village was crowned with flowers as the "Queen of the May" and placed in a little bower or arbor, where she sat in state, receiving the homage and admiration of the youthful revellers, who danced and sang around her. This custom of having a May queen seems a relic of the old Roman celebration of the day when the goddess of blooming vegetation, Flora, was specially worshiped.

But perhaps the most conspicuous feature of these festive proceedings was the erection in every town and village of a fixed pole—the Maypole—as high as the mast of a vessel of 100 tons, on which, on May morning, they suspended wreaths of flowers, and round which the people danced in rings nearly the whole day. A severe blow was given to these merry and often wild revels, by the Puritans, who, in their campaign of taking the joy out of life, caused Maypoles to be uprooted and a stop put to all the festivities. They were, however, revived after the Restoration.

Since the 1890's May Day has been adopted in much of the Western World as the international labor day.

MAY FLY, SHAD FLY, or **DAYFLY,** members of the order Ephemerida. The species, of which about 300 have been described, nearly one third of which are North American, are fragile insects with large fore wings, small or lacking hind wings, short antennae, atrophied mouth parts and two or three thread-like abdominal filaments. Being greatly attracted to lights, the adults are often a source of annoyance in lakeside and riverside towns, and are sometimes troublesome in obscuring lights from lighthouses.

The eggs are laid in fresh water, either on the surface or the bottom. The larvae, which feed mainly on vegetable matter, are active creatures with strong legs, abdominal tracheal gills, and anal appendages. They live on the bottom, under stones, covered with mud, or in burrows. After molting about 10 times wing pads appear, and these increase with each molt until the last, which may be the twentieth. This occurs in the open air. The one previous to it occurs at the surface of the water, the insect escaping from its subimago skin rather suddenly. One striking difference the adults exhibit is the development of paired sexual organs, which do not appear in other orders of insects. The larvae may take three years to develop; the adults live only a few days, lay their eggs and die. Both adults and larvae are important food for fishes, and consequently they form a favorite bait with anglers, and are imitated in making artificial flies.

MAYA, mä'yà or mī'à, an American India people of Middle America. In the strict meanin of the word, the term Maya refers to the indig enous inhabitants of the Yucatán Peninsula an to their native language. The term takes on di ferent and wider connotations when used to refe to the ancient Maya civilization, to the Maya cu tural area, or to the Maya (or Maya-Quiché linguistic stock.

Modern Maya of Yucatán.—Ethnically, th Maya still form the largest part of the populatio of the peninsula. Physically, they are small i stature (average height: men, five feet one inch women, four feet eight inches), sturdily buil very round-headed, have warm copper-colore skin, and straight, coarse, black to dark brow hair. The epicanthic eye fold occurs frequentl

Culturally, the Indian way of life has bee modified profoundly; first by Spanish influenc the result of conquest and colonization, and late by the impact of Western industrial civilizatio These factors making for cultural change hav been much less effective in the eastern part the peninsula (Quintana Roo). The sparse In dian population of this area was in rebellio against the Spaniards throughout the coloni period, and stubbornly maintained its tradition In 1847, after Mexican independence, the Indian living in the part of Yucatán which had been co onized by the Spaniards for three centuries, ro against their white masters. This war is calle the War of the Castes. When the rebellion wa suppressed, by 1850, those among the vanquishe who did not want to submit again to white dom nation fled into the Quintana Roo jungles, whe they kept up armed resistance until 1901. Eve after this date, the Indian communities of interio Quintana Roo maintained their isolation an marked hostility against any interference by th federal government. Politically, they reverte to tribal patterns of organization. Only sinc 1935 have these Maya groups shown a tendenc to become part of the Mexican nation.

Maya Languages.—Maya proper is spoke by about 350,000 individuals, two fifths of who speak Maya only. The other three fifths spea Maya and Spanish. Roughly six sevenths of th Maya-speaking population inhabits the State Yucatán. The remainder occupy the norther part of Campeche; Quintana Roo; the Coroza Orange Walk, and El Cayo districts of Britis Honduras; and a small northeastern section the Department of Petén, Guatemala.

The Maya (or Maya-Quiché) linguistic stoc includes, besides Maya proper, a number of lan guages closely related among themselves and als closely related to Maya. Linguists differ on ho the Maya-Quiché languages should be classifie with relation to each other. Abraham Mey Halpern classified them, in 1942, as follows:

Guatemalan-Yucatecan Family. It com prises: (1) Maya (spoken in the areas liste above), and Lacandon (the language of a grou of perhaps 200 Indians in the Chiapas jungle (2) Quiché, Cakchiquel, Tzutuhil, Kekchí, Poko man, Pokomchí, Uspantec (all spoken in highlan Guatemala); (3) Mam (southeastern Chiap and southwestern Guatemala), Aguacatec, Jaca tec, Ixil (all three in highland Guatemala).

Chiapas-Honduras Family. It comprises: (1 Tzental, or Tzeltal, and Tzotzil (both in Ch apas); (5) Chontal (in Tabasco; former also southern Campeche), Chol, or Cholti, an Tojolabal, or Chañabal (both in Chiapas), Ch

(highland Guatemala), Chortí (eastern Guatemala and western Honduras).

Huaxtec (or Huastec) Family.—Composed of one group only: (6) Huaxtec (northern Veracruz, eastern San Luis Potosí). Most authors also include the Chicomuceltec language (Chiapas) in this group.

Other authors (Alfred L. Kroeber and John Alden Mason) on the one hand group together the subdivisions 1, 4, and 5 (Kroeber's Lowland Maya Speech Division), and, on the other, the subdivisions 2 and 3 (Highland Division) to form the two major divisions of the Maya linguistic stock. The separate position of Huaxtec is recognized by all authorities, but Kroeber has pointed out its relationships with groups 4 and 5, and places it as a separate branch of the lowland Maya languages.

In addition to the 350,000 people speaking Yucatecan Maya, more than 1,000,000 speak languages belonging to group 2 above; more than 300,000 speak languages of group 3; more than 100,000 speak languages of the Tzental-Tzotzil group; some 135,000 speak languages of group 5; and about 50,000 speak Huaxtec. About 2,000,000 thus speak languages belonging to the Maya-Quiché linguistic stock.

ANCIENT MAYA

Area.—The area of interest in dealing with the pre-Hispanic Maya civilization comprises the following regions: the whole territory of present-day Guatemala and British Honduras, western Honduras, El Salvador, and, in Mexico, the eastern parts of Chiapas and Tabasco, the states of Campeche and Yucatán, and the Territory of Quintana Roo. This geographical area coincides generally with the area of Maya speech at the time of discovery by Europeans.

Two exceptions are nevertheless of importance. Although the Huaxtec (Huastec) speak a language which belongs to the Maya linguistic stock, they remain outside the pre-Hispanic Maya area. Archaeologists have proved that the Huaxtec separated from their linguistic relatives at an early date (perhaps 1000 B.C., or even before), and that Huaxtec culture differs markedly from the other Maya cultures. In contrast, we must include in the Maya area the Pipil, who at the time of the conquest occupied the Pacific coast of Guatemala and El Salvador southeast to the Lempa River. The Pipil spoke Nahuat, a variety of the Nahuatl language of central Mexico. Nevertheless, archaeologists have proved that the history of the area inhabited by the Pipil is intimately related to the history of the Guatemalan highlands and western Honduras.

Both from a geographic and a historical point of view, the Maya area may be divided into three parts: (1) a northern Maya area, which comprises the Yucatán Peninsula roughly north of parallel 18° 30′ N.; (2) a central Maya area, including the lowlands and foothills south of this line and north of the Chiapas-Guatemalan highlands; (3) a southern Maya area, comprising the Chiapas-Guatemalan highlands, the Pacific coast of Guatemala, and El Salvador west of the Lempa River.

Culturally, the Maya area formed the southern part of the larger cultural area which ethnologists call Meso-America, comprising central and southern Mexico, British Honduras, Guatemala, western Honduras, and El Salvador. Despite regional differences, the civilizations which flourished in this area in pre-Hispanic times shared a basically common culture, with roots in a formative stage of sedentary cultivation, the origins of which date back to before 1000 B.C.

Origins.—Botanists consider the Chiapas-Guatemala highland region an important center of the domestication of cultivated plants. The so-called common, or kidney, bean (*Phaseolus vulgaris*) and secondary varieties of corn (maize) may have been developed in this area. It is believed that corn originated in South America, and that in highland Guatemala, through hybridization with a wild plant of the genus *Tripsacum*, it acquired traits which enabled it to be cultivated not only in temperate zones, but also in humid tropical lowlands. This would give the southern Maya area priority in the development of the proto-Maya culture. Archaeological finds made in the late 1940's also uncovered evidence of an early cultural flowering in this region, which seems to antedate similar developments in other parts of the Maya area.

The earliest period of sedentary cultures in the Maya zone for which we have archaeological evidence is called Formative, Archaic, or Pre-Classic. This period came to an end about 200 A.D. The available data do not permit us to date its beginnings. Nevertheless, by making comparisons with other parts of Meso-America, it is possible to say tentatively that the oldest cultural remains found go back to 1000 B.C., or before.

The oldest evidence of human occupation of the southern Maya area consists of pits filled with household debris found on the outskirts of Guatemala City. The culture which corresponds to these middens belonged to a sedentary people which cultivated corn and probably other plants as well. They ground the corn on grinding stones (*metates*), and baked it in bowl-shaped dishes, ancestors of the flat *comal* of later times. They lived in settled communities and had houses of pole and thatch, with mud-daubed walls. They used obsidian blades and scrapers, and greenstone celts, and made baskets, mats, and textiles. They produced excellent pottery, baked-clay fetishes in human or monkey form, and stamps and seals. This culture is comparable to the Archaic cultures of central Mexico.

The last centuries before Christ represent a period of cultural flowering in the southern Maya area, which lasted until the beginnings of our

era. The majority of the 200-odd mounds at Kaminaljuyú, a large archaeological site on the southwestern outskirts of Guatemala City, were constructed during this period. The largest of these mounds is a pyramidal platform over 65 feet high, containing two interior burial chambers. The body of the lord for whom the tomb was constructed lay on a wooden platform in the center of one of the chambers, surrounded by human bodies, apparently sacrificed to accompany him on his trip to the other world, and by rich funerary offerings, including ornaments of jade, bone, shell, and pyrite, and fine pottery in heaps. All this is evidence of the high social position of the individuals given such an elaborate burial. Great archaeological sites are also known on the Pacific Coast.

The oldest remains of occupation known in the central Maya area are pottery, stone and bone tools, and shell ornaments found in a midden covered by buildings of a later period in the ruins of Uaxactún, Department of Petén, Guatemala. The lack of grinding stones in this midden perhaps indicates that corn was not cultivated in the central Maya area at this time. If this be true, it is possible that the staple food plants cultivated by these proto-Maya were roots, as in many tropical lowland regions of America. The oldest building found at Uaxactún, or at any other site in the central Maya area, belongs to a later period than this midden. It is a base for a temple, in the shape of a stepped and truncated pyramid, with fronts decorated with grotesque stucco faces. It was probably built between the beginning of the Christian era and 250 A.D.

Surveys made in the northern Maya area after 1940 indicate that settlement by sedentary populations in this area is as old as in the other Maya areas. The beginnings of monumental architecture are similarly as old in Yucatán as in Petén Department. A high artificial mound at Yaxuná, Yucatán, appears to belong to the same period as the above-mentioned Uaxactún temple.

Classic Period.—From about 300 A.D. to about 900, a civilization flourished in the central area which was at one and the same time the most brilliant civilization of the Maya and one of the most outstanding of pre-Hispanic America. Sylvanus Griswold Morley called it the "Old Maya Empire." This flowering is characterized by the following traits: great architectural development, and stone buildings roofed with corbeled vaults; temples on top of high pyramids (the highest is Temple IV at Tikal, height 229 feet); artistic climax in sculpture, painting, and decorated pottery; hieroglyphic writing; advanced arithmetic, including the concept of completion or zero, and a positional notation of numbers; highly developed astronomy; complex calendrical calculations (Long Count); the stele cult; and deities not directly related to the powers of nature.

These traits form what J. Eric S. Thompson has called "the hierarchic culture." They are traits of an urban culture, superimposed on the elements of a peasant culture, that is, on the complex of farming and supplementary food-producing activities, home industries, and a simpler religion directly concerned with the elemental forces of nature (Thompson's "lay culture"). The complex calendrical calculations, the Long Count system of reckoning time, and the associated stele cult were some of the most original traits of the classic Maya civilization.

Calendar.—The Long Count was the indispensable basis for complicated astronomical counts It served as a fixed system of reference for th other two calendars, the civil year of 365 day and the magic cycle (*tzolkin*) of 260 days. I is a count of days (or multiples of days) wit an initial date going back to 3114 B.C., accord ing to the most accepted correlation betwee this count and our own calendar. This initia date is without a doubt much earlier than th invention of the system. We are dealing her with a retroactive count. Scholars set the rea beginning of the Long Count at between abou 350 B.C. and 140 A.D. The oldest known inscrip tion of the Long Count corresponds to 320 A.D The complexity of the astronomical calculation of the Maya is evident, if one considers tha some of these calculations covered millions o years.

Steles.—The steles are memorials erected t mark time intervals. Thompson maintains tha they were not erected to commemorate indi vidual deeds, but that they constitute impersona markers of calendrical or astronomical event related to religious ideas. There are archaeo logical indications that these monuments were th objects of a real cult, and traits of this cul survive among the present-day Maya.

Cultural Centers.—The main cultural center of the classic Maya civilization seem to hav been: Tikal (Department of Petén, Guatemala) Palenque (Chiapas, Mexico); and Copán (Hon duras). Other sites are: Bonampak, Yaxchilán and Piedras Negras, in the Usumacinta Rive drainage (Mexico-Guatemala); Uaxactún an Holmul (Petén Department, Guatemala); Calak mul (southern Campeche, Mexico); San Jos (British Honduras); and Quiriguá in the lowe Motagua Valley (Guatemala).

Some archaeologists deny that these center constituted real cities. They believe that thei function was primarily religious, and that they were enormous sanctuaries with a small residen population formed by priests and their servants For this reason they prefer to call them cere monial centers. If this were true, however, on would be led to ask where the main political an commercial centers of this civilization were lo cated. Moreover, these so-called sanctuaries were very large; the ceremonial nucleus of the Tika ruins covers an area of at least 220 acres. Along with other archaeologists, the author believes that insufficient attention has been paid to th possible role of these centers as political an commercial capitals, to their urban extension and to the size of their resident populations.

Southern Area.—During the Classic period close relations existed between the southern Maya area and central Mexico. Between 300 A.D. an 600, Kaminaljuyú served as a center of diffusio of central Mexican influences in the Guatemala highlands down to Copán. The finds made b Alfred Vincent Kidder and his collaborators i the late 1930's in the big tombs at Kaminaljuyú clarified the nature of these relations between th Maya zone and Teotihuacán, the great metropoli of the Valley of Mexico. Thompson found ar chaeological evidence along the Pacific Coas which seems to indicate that the Pipil may hav arrived in the area between 700 and 850 A.D.

Yucatán.—In the Yucatán Peninsula, the ruin of Oxkintok (Yucatán State) and Cobá (Quin tana Roo) belong to the classic period. A lint found at Oxkintok showed a Long Count dat corresponding to 475 A.D. Cobá, the center of

system of causeways radiating to outlying sites, flowered especially from about 600 A.D. to about 750. One of its causeways is 62 miles long. Many of the famous archaeological sites of Yucatán, Campeche, and Quintana Roo, such as Uxmal, Kabah, Sayil, Labná, Edzna, Santa Rosa, Xlabpak, Río Bec, Xpuhil, and the oldest buildings at Chichén Itzá are dated from 600 A.D. to 1000.

Collapse.—This civilization collapsed suddenly, apparently at the peak of its flowering, without going through a well-defined period of decadence. Between 800 A.D. and 900 or 950, one after another of the cities, or ceremonial centers, were abandoned. The cultural superstructure (Thompson's "hierarchical culture") disappeared, and only the peasant culture remained. It is probable that the population decreased markedly at this time, even in the rural areas.

The causes of this crisis are unknown. Many different hypotheses have been advanced to explain it. Some of these are wholly fantastic. Those which seem most valid attribute the phenomenon to impoverishment of the soil, or to a rebellion of the peasants against the exploitation of the ruling group. Moreover, there is archaeological evidence of warfare along the western and northern periphery of the central Maya area from 630 A.D. on. All these factors may have contributed, though it is important to note that whatever their nature, they were felt over a much wider territory than the central Maya area. Meso-America went through a general crisis during the 9th and 10th centuries.

Maya After 900 A.D.—*Yucatán.*—The centers of civilization which had flourished in Yucatán during the preceding period were similarly abandoned in the 10th century. This was nevertheless followed by a period of cultural resurgence under Toltec influence. Morley called this period in the history of Yucatán until the Spanish conquest the "New Empire." It begins with the invasion by the Itzá, who were probably Chontal from Tabasco and southern Campeche, strongly influenced by Toltec culture and perhaps led by Toltec chiefs. They established local dynasties in Yucatán, which associated in a kind of confederacy. Chichén Itzá, settled by the Itzá about 987, dominated the confederacy until about 1204. A rebellion of the lords of Mayapán and Izamal then put an end to the supremacy of Chichén Itzá. This was followed by a period in which the city of Mayapán was dominant, until a new rebellion brought this hegemony to an end about 1460. After the fall of Mayapán, Yucatán remained politically divided into some 18 independent warring lordships. Culturally, there is evidence of decadence from the fall of Chichén Itzá on.

In 1511, a dozen shipwrecked Spaniards reached the shores of Yucatán. Most of them were sacrificed by the Maya. In 1517, the expedition of Francisco Hernández de Córdoba first explored the Yucatecan coast. After Francisco de Montejo had made two unsuccessful attempts to conquer Yucatán in 1527–1528 and 1531–1535, his son Francisco de Montejo the Younger finally made Yucatán a part of the Spanish realm in 1540–1546.

Southern Area.—After the collapse of the Classic civilizations, Toltec invaders also reached the highlands of Guatemala in the southern Maya area. The invaders conquered the local population, and established dynasties which lasted until the Spanish conquest. The last centuries preceding the arrival of the Spaniards was characterized by continuous warfare. The Quiché and Cakchiquel were able to conquer a part of the rich cocoa-producing lands held by the Mam, the Tzutuhil, and the Pipil on the Pacific slopes of the highlands. Around 1500, the great Aztec conqueror Ahuitzotl waged a campaign in Chiapas, which resulted in the conquest of the Pacific coast and in the establishment of some garrisons in the highlands. However, the Aztecs did not push beyond the present-day boundary between Mexico and Guatemala. In 1524, the Spanish captain Pedro de Alvarado conquered the southern Maya area.

Central Area.—Little historical and archaeological information on this period is available for the central Maya area. From the accounts of the first Spanish expeditions it would seem that the region was sparsely populated and politically fragmented. Towns were elaborately fortified with palisades and moats. The Maya of Petén maintained their independence and their cultural traditions until 1697, when Martín de Ursúa completed the conquest of the last Maya redoubts of Lake Petén.

PEDRO ARMILLAS,
Instituto Nacional de Antropología e Historia, Mexico City.

MAYAGUEZ, mä'yä-gwās', Puerto Rico, capital of district of same name, located on the west coast, 72 miles southwest of San Juan. It has a large harbor. It exports sugar, needlework, and fruit. A federal agricultural experiment station is located just outside of the city, as is the College of Agriculture and Mechanic Arts of the University of Puerto Rico. Founded in 1763, it has become an important manufacturing and industrial center, producing cheaper grades of cotton clothing for export. The city is connected by railroad with San Juan and Ponce, and by highway with all principal towns of the island. It has two radio broadcasting stations, and an active business community, which draws trade from nearby towns and rural areas. Pop. (1950) 58,944.

MAYAPAN, mī-yä-pän', archaeological site, Mexico, about 24 miles south-southeast of Mérida, Yucatán. It was a Maya capital after that people's revival in Yucatán under the influence of Toltec culture at about the beginning of the 10th century A.D. The city of Chichén Itzá dominated the confederacy, called the League of Mayapán, which had been formed by the principal cities, until the end of the 12th century, when it was captured during a rebellion of the Maya lords of the cities of Mayapán and Izamal. Mayapán then became dominant for a considerable period, but about 1460 was overthrown by a revolt under the leadership of the lords of Uxmal, and was sacked.

The present condition of the ruins seems to bear

out the traditional history that this old capital of the Mayas was completely destroyed, for little of its past magnificence now remains standing. But numerous mounds, terraces and pyramids, badly ruined edifices and huge quantities of stone, sculptured blocks and foundations of buildings scattered over a considerable extent of territory are evidence of the existence of a great centre of population and a place of some magnificence. One great mound or pyramid over 69 feet high has a stairway 20 feet wide on each of its sides leading from the ground to the truncated summit, a stone-paved platform considerably wider than the stairway. Sculptured stone blocks lie scattered over an area of three miles, attesting the great extent of this ancient Maya capital which tradition says was once surrounded by a thick and high stone wall, but that this wall was razed to the ground at the time of the final destruction of the city about 100 years before the conquest of Yucatán by the Spaniards. Along the line of this wall runs an old ditch, now filled up with débris, and on both sides of this are vast quantities of stone supposed to have once formed part of this ancient rampart. See UXMAL; CHICHEN ITZÁ; YUCATAN.

JOHN HUBERT CORNYN.

MAYBRICK, Michael («STEPHEN ADAMS»), English composer: b. Liverpool, about 1845; d. 26 Aug. 1913. He studied music in Italy and Germany and was for many years a leading baritone vocalist in concerts and English opera. As a writer of songs over the signature «Stephen Adams,» he was widely popular in this country and England. Among the best known of his many songs are 'The Midshipmite'; 'Nancy Lee'; 'Alsatian Mountains'; 'The Holy City'; 'A Warrior Bold.'

MAYENCE, mä-yŏńs. See MAINZ.

MAYER, Alfred Goldsborough, American zoologist: b. Md., 16 April 1868; d. Fla., 24 June 1922. In 1889 he was graduated at the Stevens Institute of Technology and at Harvard in 1897. From 1892 to 1900 he was assistant to Dr. Alexander Agassiz and had charge of radiates in the Harvard Museum of Comparative Zoology from 1895 to 1900. In 1900–04 Dr. Mayer was curator of natural sciences and curator-in-chief of the Brooklyn Institute Museum; in 1904–05 he was director of the marine laboratory of the Carnegie Institution, Tortugas, Fla., and after 1905 was director of the department of marine biology at the Carnegie Institution, Washington. Dr. Mayer took part in several scientific expeditions in many parts of the world. In 1913 he became lecturer in biology at Princeton. His works include 'Medusæ of the World' (3 vols., 1910); and contributions to zoological publications, especially on the insects and medusæ and on chemical causes of animal movements; effects of ions upon rate of nerve conduction; studies of coral reefs of Samoa, etc.

MAYER, mā'ėr, **Alfred Marshall,** American physicist: b. Baltimore, 13 Nov. 1836; d. Maplewood, N. J., 13 July 1897. He studied at Saint Mary's College, Baltimore; spent two years in a machine-shop and draughting-room; specialized in chemistry and physics; became professor of these branches in the University of Maryland (1856) and in Westminster College, Fulton, Mo. (1859); after two years of study in Paris was appointed to a chair in Pennsylvania College, Gettysburg (1865); went thence to Lehigh University in 1867; and from 1871 to his death was professor of physics in Stevens Institute, Hoboken, N. J. There he made important researches in acoustics; invented the topophone, an apparatus to detect the phases of sound vibration; discovered five methods of analysis of compound sounds into their elementary tones; and stated the law of tuning-fork vibration. He became a member of the National Academy of Sciences in 1872. He wrote many papers for the *American Journal of Science,* notably a series entitled 'Researches in Acoustics' and was at one time a member of the editorial staff; several contributions to the *Scientific American Supplement;* 'Lecture Notes on Physics' (1868); 'The Earth a Great Magnet' (1872); 'Light' (1877); and 'Sound' (1878). Consult *Science* (issue of 20 Aug. 1897).

MAYER, Brantz, American author: b. Baltimore, 27 Sept. 1809; d. there, 21 March 1879. He was educated at Saint Mary's College, Baltimore, studied law by himself during an Oriental voyage in 1827–28 and then at the University of Maryland; was admitted to the bar in 1829; and after a year in Mexico as secretary of legation wrote 'Mexico as it Was, and as it Is' (1844). In the same year he founded the Maryland Historical Society. In the Civil War he sympathized with the Union was president of the Union State General Committee, and from 1863 to 1871 paymaster in the United States army. His best book was 'Captain Canot,' a story of the slave trade founded on fact. He wrote also 'Mexico, Aztec, Spanish, and Republican' (1851); 'Observations of Mexican History and Archæology' (1856); 'Mexican Antiquities' (1858); 'Memoir of Jared Sparks' (1867); and 'Baltimore as it Was, and as it Is' (1871).

MAYER, Constant, American artist: b. Besançon, France, 4 Oct. 1832; d. 1901. A student at the School of Fine Arts in Paris he left his studies in 1857 and settled in New York, where his sketches and portraits won immediate success. His portraits of Grant and Sherman and his life-sized genre paintings such as 'Maud Müller'; 'The Song of the Shirt'; 'Evangeline,' gained favor. From 1866 he was an associate of the National Academy of Design and exhibited frequently at the Salon.

MAYER, mī'ĕr, **Julius Robert von,** German physicist: b. Heilbronn, Germany, Nov. 25, 1814; d. there, March 20, 1878. He was educated at the gymnasium in Heilbronn, studied medicine at Tübingen and finished his university studies at Munich and Paris. In 1840 he went to Java as a ship's surgeon, and while there turned his attention to studies of the blood, extending his work to exhaustive investigations of animal heat, to which he applied the mechanical theory. Returning in 1841 to Heilbronn, where for some years he practiced his profession, he became deeply engrossed with his scientific labors, and in 1842 published in Liebig's *Annalen der Chemie und Pharmacie* a preliminary statement of his revolutionary theory of heat, together with his views on the conservation and correlation of energy. Three years later he restated his results in *Die organische Bewegung in ihrem Zusammenhang mit dem Stoffwechsel,* at the same time giving a forecast of his theory of the meteoric origin of the sun's heat. Contemporaneously with Mayer the mechanical theory of heat was worked out independently by James Prescott Joule (q.v.) in England, and a controversy arose regarding the priority of discovery.

MAYER, Louis Burt, American motion picture producer: b. Minsk, Russia, July 4, 1885. Of Jewish parentage, he was brought to Canada as a child and educated in the public schools of St. John, N. B. Until 1906 he engaged in salvaging ships and industrial plants. In 1907 he began his motion picture career as operator of a cinema theater at Haverhill, Mass., soon obtaining control of all the theaters in that town. In 1912 he became a naturalized American citizen, and two years later acquired the New England rights for D. W. Griffith's epochal *Birth of a Nation.* He expanded his activities by conducting a film booking agency covering New England, then helped to organize and was vice president of Metro Pictures Corporation which, in 1924, merged with the Goldwyn Company to become the Metro-Goldwyn-Mayer Corporation, with Mayer as first vice president in charge of production. Hollywood's Motion Picture Academy on March 29, 1951 presented him with a special "Oscar" award "for more than 35 years' outstanding contribution to the industry."

MAYFAIR, mā'fâr, a fashionable neighborhood, London, England, in the West End adjoining Belgravia, east of Hyde Park, and bounded by Park Lane and Bond Street. See also LONDON.

MAYFIELD, city, Kentucky, and Graves County seat; altitude 421 feet; 23 miles south of Paducah; on the Illinois Central Railroad. It is in an agricultural area producing tobacco, cotton and milk, and has manufactures of men's and boys' clothing, and condensed milk. Mayfield is an important national market for dark, fire-cured tobacco In February, each year, is held a mule market.

The town was founded about 1823 and incorporated in 1850.

MAYFIELD, borough, Pennsylvania, in Lackawanna County; altitude 952 feet; 11 miles northeast of Scranton; on the Delaware and Hudson Railroad. It is a coal mining center; the mines here, first developed prior to 1840. were sold to the Delaware and Hudson Canal Company in 1874. Pop. (1940) 3,172; (1950) 2,373.

MAYFLOWER, The, the name of the vessel in which the Pilgrim Fathers, or first colonists in New England, sailed to that country in 1620. The *Mayflower* was a vessel of 180 tons. She set sail from Southampton, England,

The Mayflower

on Aug. 4/15, 1620 (Old Style and New Style dates) in company with the smaller *Speedwell.* The latter's leaky condition forced them eight days later to put back into Dartmouth harbor. About August 22/ September 2, they again set sail, but the *Speedwell* proving quite unseaworthy they made port at Plymouth where she was abandoned. Here some passengers, disheartened, gave up the venture. On a third attempt the *Mayflower* alone sailed out of Plymouth on September 5/16, with a complement of 102 passengers and crew.

The Pilgrims aboard the *Mayflower* sighted Cape Cod on November 8/19 and their ship dropped anchor in what is now Provincetown Harbor at the Cape's point, November 10/21. They took on wood and water, mended their shallop and used it to explore the coast. On December 10/21 the future Plymouth harbor was explored and judged suitable for a settlement. Five days later the *Mayflower* dropped anchor there. She set sail on her return voyage March 25/ April 5, 1621, and arrived safely in London. Her history after 1624, when she was again in London, is unknown.

The male passengers aboard the *Mayflower* were as follows:

THE MAYFLOWER PASSENGERS

Alden, John
Allerton, Isaac
Allerton, John
Billington, John
Bradford, Wm.
Brewster, Wm.
Britterage, Richard
Brown, Peter
Carver, John
Chilton, James
Clarke, Richard
Cook, Francis
Crackston, John
Dotey, Edward
Eaton, Francis
English, Thos.
Fletcher, Moses
Fuller, Edward
Fuller, Samuel
Gardiner, Richard
Goodman, John
Hopkins, Stephen
Howland, John
Leister, Edward
Margeson, Edward
Martin, Christopher
Mullins, William
Priest, Degony
Rigdale, John
Rogers, Thomas
Soule, George
Standish, Miles
Tilly, Edward
Tilly, John
Tinker, Thomas
Turner, John
Warren, Richard
White, William
Williams, Thomas
Winslow, Edward
Winslow, Gilbert

With these 41 male passengers and heads of families came 15 male servants, whose names were as follows:

SERVANTS ON THE MAYFLOWER

Carter,	Langemore,	Sampson,
Coper,	Latham,	Story,
Ely,	Minter,	Thompson,
Holbeek,	Moore,	Trevore,
Hooke,	Prower,	Wilder.

These first Massachusetts settlers, before debarking at Cape Cod, signed a compact on Nov. 11, 1620, providing for a "civil body politic" to make all their laws. It remained Plymouth Colony's basic governmental charter until 1691, when that colony was absorbed by Massachusetts. The Mayflower Compact reads as follows:

In the name of God Amen! We whose names are underwritten, the loyal subjects of our dread sovereign Lord, King James, by the grace of God, of Great Britain, France and Ireland, King, Defender of the Faith, etc., have undertaken for the glory of God and the advancement of the Christian faith, and honor of our King and Country, a voyage to plant the first colony in the northern parts of Virginia; do by these presents, solemnly and mutually, in the presence of God and of one another covenant and combine ourselves together into a civil body politic for our better ordering and preservation, and furthermore of the ends aforesaid; and by virtue hereof to enact, constitute and frame just and equal laws, ordinances, acts, constitutions, and offices from time to time, as shall be thought most mete and convenient for the general good of the colony; unto which we promise all due submission and obedience. In witness whereof we have hereunto subscribed our names, at Cape Cod, the 11th of November, in the year of the reign of our sovereign Lord, King James of England, France and Ireland, the Eighteenth, and of Scotland the Fifty-fourth, Anno Domini, 1620.

Whittier, Lowell, Holmes and other poets have immortalized the *Mayflower* in well-known poems.

Consult Carpenter, E. J., *The Mayflower Pilgrims* (New York 1918).

MAYFLOWER. See Arbutus, Trailing.

MAYHEM, *in law,* the maiming of one person by another, the destroying or disabling of an arm, leg, hand or foot, putting out an eye, etc. Mayhem renders the perpetrator liable to a civil action for damages, and also to a criminal prosecution.

MAYHEW, mā'hū, **Experience,** American missionary: b. Martha's Vineyard, Mass., Jan. 27, 1673; d. there, Nov. 29, 1758. He took charge of a half-dozen congregations of Indians, and in 1709 executed for the Society for the Propagation of the Gospel in New England a translation of the Psalms and of the Gospel according to St. John into the Indian tongue. His principal writing is *Indian Converts* (1727), containing accounts of 30 Indian ministers and 80 other Indian Christians.

MAYHEW, Henry, English journalist and author: b. London, Nov. 25, 1812; d. July 25, 1887. In 1831 he started, with Gilbert à Beckett, a periodical called *Figaro in London;* in 1841 produced, with à Beckett, the farce of the *Wondering Minstrel;* and not long after formed a literary partnership with his brother Augustus, the Brothers Mayhew, as they came to be familiarly known, turning out a number of most successful works of amusing fiction.

Among these may be mentioned *The Greatest Plague of Life, or the Adventures of a Lady in Search of a Good Servant* (1847); *The Image of His Father, or One Boy is More Trouble than a Dozen Girls* (1850); *Living for Appearances* (1855). In 1851 appeared the first volume of his most important work, *London Labor and the London Poor.* He was one of the founders of *Punch* (1841) and its first editor. His brothers Horace, Thomas and Edward also assisted Henry and Augustus in their enterprises, besides publishing independently.

MAYHEW, Jonathan, American clergyman: b. Martha's Vineyard, Mass., Oct. 8, 1720; d. Boston, July 9, 1766. He was graduated from Harvard in 1744, and from 1747 until his death was minister of the West Church in Boston. In a day of theological controversy he was prominent for his tracts. His views were so liberal as to exclude him from the Boston Association of Congregational Ministers. He opposed the measures of the British Society for the Propagation of the Gospel in Foreign Parts, and got into dispute about it with Thomas Secker (1693–1768), archbishop of Canterbury. In both pulpit and press he was an earnest patriot, being of much assistance to Otis and other early leaders. By the Tories he was considered to have brought about the Stamp Act riots because of a sermon in which he pleaded for the repeal of the act. From him came the suggestion of uniting the colonies in opposition to England. Among his writings are *Seven Sermons* (1749); *Discourse Concerning Unlimited Submission and Non-resistance to the Higher Powers* (1750), and *Sermons* (1756).

MAYHEW, Thomas, American colonial governor: b. England, 1592; d. Martha's Vineyard, Mass., March 25, 1682. Prior to his emigration to New England in 1631 he had been a merchant in Southampton. He settled first at Watertown, Mass., and in 1641 secured from the agent of Lord Stirling a grant of the larger part of the island of Martha's Vineyard and the title of governor. With his son Thomas he labored to convert the Indians of the island so successfully that during King Philip's War the island Indians protected the white settlers. He founded Edgartown in 1647, and after the death of his son and grandson continued their ministry and organized an Indian church.

MAYNARD, mā'nērd, **Charles Johnson,** American ornithologist: b. West Newton, Mass., May 6, 1845; d. there, Oct. 15, 1929. He went to public school, worked on a farm and studied natural history as a boy. He was well known as an ornithologist, and the discovery of the vocal organs of the American bittern is attributed to him. In 1875 he was elected vice president of the Nuttall Ornithological Club, in connection with which he founded and edited *The Nuttall Bulletin.*

He was the author of a number of books growing out of his work, among them being *Naturalists' Guide; Birds of Eastern North America; Butterflies of New England; Field Directory of Birds of Eastern North America; Atlas to the Discovery of Birds of Eastern North America; Records of Walks and Talks with Nature,* 12 vols.

MAYNARD, Edward, American inventor: b. Madison, N. J., April 26, 1813; d. Washington, D.C., May 4, 1891. He entered West Point in 1831; resigned because of ill-health in 1832; studied dentistry and practiced in Washington

from 1836 to 1890. He invented new dental tools, discovered in 1846 the diversity of the maxillary antra, introduced the method of filling cavities with gold foil, taught dentistry in the Baltimore College of Dental Surgery and in the National University at Washington, and practiced successfully in Europe.

He is best known for his invention of small arms and new priming methods which superseded percussion caps. He patented a breech-loading rifle in 1851; a method of converting muzzle-loaders to breech-loaders in 1860; a plan to join two barrels so that contraction and expansion in either would be independent of the other, in 1868, and in 1886 a registering device showing the number of cartridges in a magazine rifle. His rifle was adopted by the United States, and brought him decorations from the governments of Belgium, Prussia, and Sweden.

MAYNARD, George Willoughby, American artist: b. Washington, D.C., March 5, 1843; d. April 5, 1923. He studied at the New York Academy of Design and at the Belgian Royal Academy, Antwerp. He had a studio in Paris in 1878, but later located in New York. He was a National Academician and librarian of the National Academy of Design, member of the Society of American Artists, the American Water Color Society and ex-president and honorary member of the Salmagundi Club. Maynard's decorative work may be seen in the Congressional Library, Washington, D.C., the ceiling of the Metropolitan Opera House, New York, the Essex County Courthouse, Newark, N. J., and the Appellate Court, New York. His principal canvases are *Vespers at Antwerp* (1776); *Venetian Court; Ancient Mariner* (1883); *Strange Gods* (1904); *Old and Rare;* and *Rocks at Ogunquit* (1912). He is represented in the Metropolitan Museum, New York, the Providence Museum, the Corcoran Gallery, Washington, and the Pennsylvania Academy.

MAYNARD, Horace, American politician: b. Westboro, Mass., Aug. 30, 1815; d. Knoxville, Tenn., May 3, 1882. He was graduated from Amherst College in 1838; and became instructor, and later professor, in East Tennessee College, Knoxville, Tenn. He studied law, was admitted to the bar in 1844 and built up a successful practice. In 1857 he was nominated for member of Congress by the Know-Nothing Party, and elected. On the outbreak of the American Civil War he declared his loyalty to the Union and took an active part in the unsuccessful attempt to keep Tennessee from seceding; on this account he suffered persecution and heavy loss of property during the war. When the Union forces occupied his state in 1864 he was made attorney general. In 1866–1875 he was again member of Congress, being representative at large for his state in the last two years. In 1875–1880 he was appointed minister to Turkey, and in 1880 postmaster general in President Hayes' Cabinet, holding the office until March 4, 1881.

MAYNARD, Theodore, historian and poet: b. Madras, India, Nov. 3, 1890, where his parents were Protestant missionaries. Educated in England and America he received the Ph.D. degree from the Catholic University of America.

Most of Dr. Maynard's life has been spent in America, where he became a citizen in 1941. After working as a minister, journalist, and teacher, he gave all his time to writing, chiefly in the field of biography.

Among his books are: *Laughs and Whiffs of Song* (1915); *Drums of Defeat* (1916); *Carven from the Laurel Tree* (1918); *A Tankard of Ale* (1919); *The Divine Adventure; The Last Knight* (both 1921); *Exile and Other Poems* (1933); *Man and Beast* and *The Odyssey of Francis Xavier* (both 1936); *Apostle of Charity,* a life of St. Vincent de Paul (1939); *Queen Elizabeth* (1940); *The Reed and the Rock* (a life of Bishop Simon Brute), and *Orestes Brownson, Yankee, Radical, Catholic* (both 1942); *Too Small a World,* a life of Mother Cabrini (1945), and anthologies of prose and verse. His best-known work is *The Story of American Catholicism* (1941). In 1938 he published his autobiography under the title of *The World I Know.* In 1912 he became a convert to the Roman Catholic Church.

MAYNARD, town, Massachusetts, in Middlesex County, altitude 176 feet, 21 miles west-northwest of Boston. It is served by the Boston and Maine Railroad. Its principal manufactures are woolens, chemicals, and beverages. Settled in 1638; incorporated in 1871. Pop. (1950) 6,978.

MAYNOOTH, town, Ireland, in County Kildare, 15 miles west-by-north of Dublin. Located here is famous St. Patrick's College. This college is the chief center for the training of Roman Catholic diocesan clergy in Ireland. It was established in 1795 on the site of a college founded by the earl of Kildare in the 16th century, which was suppressed by Henry VIII.

Maynooth is of historic interest as the seat of the powerful Geraldines, and has ruins of their castle, built 1176 and enlarged in 1426. Several battles with the English occurred here, notably in the rebellion of Silken Thomas in the reign of Henry VIII, and the War of the Confederates (1641–1650). Pop. (1946) 572.

MAYO, mā'ō, **Amory Dwight,** American Unitarian clergyman and educator: b. Warwick, Franklin County, Mass., Jan. 31, 1823; d. April 8, 1907. He was graduated from Amherst, and taught in the public schools in Massachusetts 1839–1844. In 1846 he became minister of the Universalist Church at Gloucester, Mass., and later held Universalist pastorates at Cleveland, Ohio (1854–1856), and at Albany, N. Y. (1856–1863). He then entered the Unitarian ministry, and was pastor at Cincinnati, Ohio (1863–1872), and at Springfield, Mass. (1872–1880). He was long prominent as an educator, was an efficient and active member of the boards of education, in Cincinnati and Springfield, and was connected with the Meadville (Pa.) Theological School as lecturer and professor from 1868–1898. After 1880 he devoted his attention chiefly to the advancement of education in the South, lecturing frequently in many different states. He was the chief editorial writer for the *New England and National Journal of Education,* and published *The Moral Argument for Universalism; Graces and Powers of the Christian Life* (1852); *Biography and Collected Writings of Mrs. S. C. E. Mayo; Symbols of the Capital or Civilization in New York* (1859); *Talks with Teachers* (1885); *Southern Women in the Recent Educational Move-*

ment in the South' (1892), and 'History of the American Common School.'

MAYO, Charles Horace, American surgeon: b. Rochester, Minn., 19 July 1865; d. Chicago, Ill., 26 May 1939. He was educated at the Rochester High School, Northwestern University, and in 1888 was graduated in medicine at the Chicago Medical College. In the same year he entered on the practice of medicine at Rochester, where he afterward resided. He received many honorary degrees, among them: A.M., Northwestern University, 1902; LL.D., University of Maryland, 1909; F.A.C.S., American College of Surgeons, 1913; LL.D., Kenyon College, 1916; D.Sc., University of Leeds, 1927. Dr. Mayo was surgeon to the Mayo Clinic of Saint Mary's Hospital, Rochester, Minn.; to the Mayo Foundation, University of Minnesota, where he was professor of surgery after 1915. In 1913 he was commissioned first lieutenant in the Medical Reserve Corps, United States Army; was appointed major in 1917, and colonel in the same corps in 1918. In the same year he was made associate chief consultant of the United States Army Medical Department for Surgical Services. He was also consulting surgeon of the Chicago and Northwestern Railway and of the Chicago Great Western Railway. Dr. Mayo was a member of the American Medical Association, of which he was president in 1916–17 and chairman of the section on surgery in 1910; of the American Surgical Association; of the Association of Military Surgeons of the United States; of the Clinical Congress of the American College of Surgeons (president in 1914–15); of the Minnesota State Medical Society, of which he was president in 1905; of the Society of Clinical Surgery; of the Southern Surgical and Gynecological Society, of the Western Surgical and Gynecological Society, of which he was president in 1904–05; of the Council of National Defense Medical Board; of the National Medical Museum; of the Minnesota Pathological Society; of the American Association of Railway Surgeons; of the American Association for the Advancement of Science; etc., etc. In 1908–09 he was president of the section on surgery of the International Congress on Tuberculosis. In 1915, with his brother, W. J. Mayo (q.v.), he donated $1,500,000 to establish the Mayo Foundation for Medical Education and Research at Rochester, in affiliation with the University of Minnesota.

MAYO, Frank, American actor: b. Boston, 19 April 1839; d. 8 June 1896. His first appearance on the stage was at the American Theatre in San Francisco, and he was for several years the leading actor on the Pacific coast. In August 1865 he appeared in Boston as Badger in 'The Streets of New York' with great success, and though he played Shakespearian and other rôles acceptably, notably Othello, Hamlet and Ferdinand, became best known in his character of Davy Crockett, first played by him in Rochester, N. Y., in 1872, and thereafter almost exclusively by him till 1884. In later years he played in his own drama of 'Nordeck' and in a stage version of 'Pudd'nhead Wilson.'

MAYO, Henry Thomas, American naval officer: b. Burlington, Vt., 8 Dec. 1856; d. 23 Feb. 1937. In 1876 he was graduated at the United States Naval Academy; advanced through various grades to rear-admiral 15 June 1913. In 1915 he was made vice-admiral and in 1917 was promoted admiral. He served on various vessels of the United States Navy, also on both naval and coast survey; was commandant of the Mare Island navy yard in 1911–13; served as aide for *personnel* at the Navy Department, Washington, in 1913, and on 18 December of that year was made commander of the fourth division of the Atlantic fleet. In 1915 he commanded the battleship squadrons of the Atlantic fleet and two years later became commander-in-chief of that fleet and hoisted his flag on the *Pennsylvania.* Admiral Mayo demanded an apology from the Mexican commander at Tampico and the firing of a national salute of 21 guns to the United States flag, to make amends for arrest of paymaster and crew of the dispatch boat *Dolphin* at a wharf while loading gasoline into whaleboat on 9 April 1914. The admiral's action was commended and approved by the government at Washington, and the occupation of Vera Cruz later in the same month was one result of the flag incident. Reverted to rank of rear-admiral 1919. Retired 1920.

MAYO, William James, American surgeon: b. Le Sueur, Minn., 29 June 1861; d. 28 July 1939. He was a brother of Charles Horace Mayo (q.v.), was educated at Rochester High School and Niles Academy and received his professional training at the University of Michigan, where he was graduated in 1883. Thereafter he practiced in Rochester, Minn., as surgeon to Saint Mary's Hospital. He became first lieutenant of the Medical Reserve Corps of the United States army in 1913. With his brother he established the Mayo Foundation for Medical Education and Research at Rochester in 1915. He was regent to the University of Minnesota, was president of the State Medical Society in 1895–96, of the American Medical Association in 1905–06, of the American Surgical Association in 1913–14, and of the Society of Clinical Surgery, 1911–12. He was also a member of the American College of Surgeons, of the Clinical Congress of Surgeons of North America, of the Academie de Medicine de Paris (corresponding secretary), of the Société de Chirurgie de Paris, of the Royal College of England and Scotland. He received honors from all the principal universities, among them: M.D., University of Michigan, 1883; A.M., University of Michigan, 1889; LL.D., University of Toronto (1906), University of Maryland (1907), University of Pennsylvania (1912); D.Sc., University of Michigan (1908) and Harvard University (1924). He was a Fellow of the Royal College of Surgeons of England from 1913, of Scotland from 1905 and of the American College of Surgeons from 1913. He was widely known for his numerous successful operations in cases of gallstones, cancer and diseases of the intestinal tract.

MAYO, William Starbuck, American novelist: b. Ogdensburg, N. Y., 20 April 1812; d. New York 22 Nov. 1895. His parents had removed to Ogdensburg in the year of his birth. He studied in his native place and in Potsdam Academy and in 1833 was graduated at the College of Physicians and Surgeons, New York. After practising his profession for several years in Ogdensburg he was forced to abandon it owing to ill health. He visited Spain, made a tour in the Barbary States and

then took up his residence in New York City, where he gave his entire attention to literature. He is the author of 'Flood and Field, or Tales of Battles on Sea and Land' (1844); 'Kaloolah, or Journeys to the Djebel Kumri,' purporting to be the autobiography of Jonathan Romer and describing his marvelous adventures in Africa (1849); 'The Berber, or the Mountaineer of the Atlas,' similar to the preceding (1850); 'Romance Dust from the Historic Places,' a collection of short tales, founded on historical incidents (1851); 'Never Again,' a novel (1872).

MAYO, mī'ō, a tribe of Mexican Indians of the Piman family, located on the banks of the Mayo River in southern Sonora. Their allies and northern neighbors are the Yaquis and their habits and language, the latter known as Cahita, are almost identical. They are a peaceful, agricultural people and are thoroughly Mexicanized. They number perhaps 6,000.

MAYO-SMITH, mā'ō-smith', **Richmond,** American political economist: b. Troy, Ohio, 9 Feb. 1854; d. New York City, 11 Nov. 1901. He was graduated from Amherst College in 1875 and studied in Germany for two years at the universities of Berlin and Heidelberg. From 1877 he was connected with Columbia University, first as assistant in history and political science, then as adjunct professor (1878–83) and professor of political economy and social science (1883–1901). He was also one of the faculty of the graduate School of Political Science, established in 1880, and his chief work as teacher was done in this school. His specialty was statistics, on which he was a recognized authority. He was an honorary Fellow of the Royal Statistical Society of Great Britain, a member of the International Statistical Institution and of the American Statistical Association, being vice-president of the latter; he was also a member of the National Academy of Science and of the American Economic Association, of which he was one of the founders. He was editor of the *Political Science Quarterly* from 1886, and published 'Emigration and Immigration' (1890); 'Statistics and Sociology' (1895); and 'Statistics and Economics' (1899).

MAYON, mä-yōn', a volcano of the Philippines situated in the northern part of the province of Albay, Luzon, height, 8,274 feet. It rises from a broad plain about six miles from Albay Gulf and forms a perfect cone; its summit is surrounded by vapor, which at night has a fiery glow. Its sides, almost at the top, are covered with grass or moss, and the ascent, though it has been made, is difficult. Near the summit there are fissures which emit sulphurous gases and steam, and there were several eruptions during the 19th century, the town of Cagsaua at the foot of the mountain being entirely destroyed in 1814. Great quantities of lava and ashes were belched forth in the last eruption (1897).

MAYONNAISE, mā-ŏn-āz', a thick cold dressing for salads, cold meat, poultry, fish, vegetables, etc., made of the yolks of eggs, salad oil and vinegar, with a little salt and pepper; it is sometimes colored red with powdered lobster shell or green with spinach or parsley.

MAYOR. See Cities, American, Government of; City Manager Plan of Government; Executive.

MAYOR OF ZALAMEA, The ('El Alcalde de Zalamea'). Two Spanish plays bear this title, the first by Lope de Vega (1562–1635), the second, an adaptation, by Calderón de la Barca (1600–81). The superiority of the adaptation over the original is admitted by all critics. A comparison of the two works is somewhat unfair to Lope de Vega, because his play is one of his least worthy productions. He reveals, indeed, his characteristic spontaneity, but fails to seize resolutely upon the dramatic possibilities of his story, preferring for some reason to narrate events in their chronological sequence. Calderón studies the dramatic situations more carefully and by discarding irrelevancies, reducing the number of personages and sharpening the features of those retained, produces a masterpiece. To his predecessor he owes his plot, the dramatic conflict, the principal personages and a few lines which he transfers to his play unaltered. The most striking difference between the two pieces is the character of Isabella, daughter of the mayor (or magistrate). In Lope's play there are two daughters, both flirtatious to the last degree. So little control has the father over them, that when he is appointed magistrate, he asks pathetically, "How can a father who fails to rule at home, govern a town?" The fate of the daughters at the hands of dissolute soldiers does not surprise the spectator, and the penalty of death imposed upon the seducers hardly seems justified. Calderón corrects this defect, and in Isabella, who replaces Leonora and Agnes, he presents a modest young woman, the unhappy victim of a crime which she strives in vain to prevent. Her soliloquy after she has been wronged is pathetic and poignant, and is one of the best passages in the play (Act II, scene i). Among other excellent scenes may be noted the magistrate's farewell to his son, in which shrewd advice and good feeling are happily blended (Act II, scene xxi), and the prolonged struggle between the magistrate and the gouty, blustering, irascible, old soldier, Lope de Figueroa (Act III, scene xv). King Philip II, who appears suddenly at the close of the play, sets his seal of approval upon the action of the father-magistrate in avenging the wrong done to his daughter and thus vindicates the triumph of justice and local autonomy (a precious privilege to Spaniards) over the lawlessness of undisciplined soldiery. The events narrated by the two dramatists are so circumstantial that it is assumed that they are based on a real incident in the march of Philip II into Portugal (1580), when the Tercio de Flandes, a famous regiment commanded by Lope de Figueroa, passed through Zalamea, a small town in Estremadura. Krenkel published both plays with valuable notes in 'Klassische Bühnendichtungen der Spanier' (Vol. III, Leipzig 1887). Consult also Menéndez y Pelayo's edition in 'Obras de Lope de Vega' (Vol. XII, 1902), and 'Select Plays of Calderón' (ed. Maccoll, London and New York 1888).

Milton A. Buchanan.

MAYORUNA, South American Indian tribe of Panoan stock. Their country lies south of the Marañon and between the Ucoyali and

Javarí rivers, in northeastern Peru. Seminomadic, they live mainly by hunting. They are hostile to their neighbors and have resisted acculturation. In 1940 they numbered about 3,000.

MAYOTTE, mä-yôt′, easternmost of the Comoro Islands (q.v.).

MAYOW or **MAYOUWE** or **MAYO,** mā′ō, **John,** English physiologist and chemist: b. London, May 24, 1640; d. there, October 1679. He entered Wadham College, Oxford University, in 1658 and was elected a fellow of All Souls in 1660. He received the degrees of bachelor (1665) and doctor (1670) of civil law, and studied medicine, which he practiced in Bath. In 1678 he was elected a fellow of the Royal Society. Mayow was the author of *Tractatus duo, de Respiratione et de Rachitide* (1668), the first part of which correctly described the mechanism of respiration and showed that the function of breathing is to give oxygen to the blood, and that the heart is a muscle for pumping blood through the body. In 1674 he published an expanded work, *Tractatus quinque Medico-Physici,* in which he described the chemistry of combustion and showed that combustion and respiration are analogous.

MAYSVILLE, city, Kentucky, seat of Mason County, situated at an altitude of 450 feet, on the Ohio River and the Chesapeake & Ohio and the Louisville & Nashville railroads, 64 miles southeast of Cincinnati. The city serves as a river port and is an important burley tobacco market. Its industrial products include automobile and bicycle accessories, shoes, pulleys and transmission equipment, condensed milk, cans, textiles, and distillery products.

Settled about 1782 and first called Limestone, Maysville was established in 1787 by the Virginia legislature and named for John May, on whose land it was originally laid out. It was incorporated in 1833. Government is of the commission type. Pop. (1950) 8,632.

MAYURBANJ, mä-yo͝orb′hŭnj, former princely state, India, with an area of 4,034 square miles. In 1949 it became a district of Orissa (q.v.).

MAYVILLE, city, Wisconsin, situated in Dodge County, on the Rock River and the Chicago, Milwaukee, St. Paul and Pacific Railroad, 52 miles northwest of Milwaukee. The city's industrial establishments produce sheet metal products, shoes, luggage, tools and dies, dairy products, and canned foods. Mayville has a community park and a public library. Settled in 1845, it was incorporated in 1885. It is governed by a mayor and council. Pop. (1950) 3,010.

MAYWOOD, city, California, situated in Los Angeles County, 6 miles southeast of downtown Los Angeles, of which it is a residential suburb. It is served by Pacific Electric Railway motor coaches. The city has plants producing automobile accessories, furniture, processed food, and steel. Founded in 1920, it was incorporated in 1924. Government is administered by a mayor and council. Pop. (1950) 13,292.

MAYWOOD, village, Illinois, situated in Cook County, on the Des Plaines River and the Chicago Great Western, the Chicago and North Western, the Chicago Aurora and Elgin, and the Indiana Harbor Belt railroads, 12 miles west of Chicago. The seat of Chicago Lutheran Theological Seminary, its industries include canning and tubing. Incorporated 1881; mayor-council government. Pop. (1950) 27,473.

MAYWOOD, borough, New Jersey, situated in Bergen County, just north-northwest of Hackensack and 12 miles west of New York City, on the New York, Susquehanna & Western Railroad. A residential community, Maywood also has plants producing chemicals and pharmaceuticals. It was incorporated in 1894. Government is by a mayor and council. Pop. (1950) 8,667.

MAZAGAN, măz-ä-găn′ (Arab. El Jedida), city, French Morocco, situated on the west coast, 55 miles south of Casablanca. A fishing port and resort, it enjoys a sizable trade in agricultural products. It was a Portuguese possession from 1502 to 1769. Pop. (1947) 40,318.

MAZAR-I-SHARIF, mä-zär′ê-shä-rēf′, city, Afghanistan, capital of the province of Mazar-i-Sharif, situated 190 miles northwest of Kabul. The leading city of Afghan Turkestan, it produces silk and cotton textiles, flour, and bricks. The older section of the city surrounds a 15th century mosque containing the alleged tomb of Caliph Ali, son-in-law of Mohammed. Pop. (1948 est.) 41,960.

MAZARIN, mä-zä-răN′ (Ital. Giulio Mazarini), French cardinal and statesman: b. Pescina, Italy, July 14, 1602; d. Vincennes, March 9, 1661. He studied with the Jesuits in Rome and from 1619 to 1622 at the University of Alcalá in Spain. In 1625 he entered the papal military service as an infantry captain. His talents, however, lay in diplomacy, to which he soon turned and in which he distinguished himself on missions for Pope Urban VIII. He was rewarded for his services by being appointed vice legate to Avignon (1634) and nuncio to France (1634–1636). In Paris he gained the favor of Cardinal Richelieu, who induced him to enter the service of France. He became a naturalized French citizen in 1639, and in the following year was sent on a mission to Savoy. In 1641 he was made a cardinal (although he was not a priest), and in 1642 was designated by Richelieu as his successor. On the death of Louis XIII in 1643, Anne of Austria became regent for her young son, Louis XIV. It was thought that Mazarin would be dismissed, but he won the queen regent's favor and was retained in the office of prime minister, which he continued to hold, with the exception of two brief periods of exile, until his death. Mazarin turned at first to the prosecution of the Thirty Years' War, which the success of French arms helped to bring to a conclusion in 1648. Meanwhile, his neglect of domestic affairs, his nepotism, and his accumulation of wealth had aroused much discontent. The Parliament of Paris denounced the increasing taxation, and the nobility dreaded Mazarin's rising power. As a result, the civil war known as the Fronde (q.v.) broke out. In January 1649 Mazarin left Paris with the court and took up residence in St.-Germain. In April he concluded peace with the Parliament, but further opposition developed from the aristocracy, and in

particular from Condé, who had hitherto remained faithful to the royal authority. With the support of the parliamentarians, Mazarin was enabled to put down the *Fronde des princes*, imprisoned Condé at Vincennes and crushed the revolt of the latter's friends at Rethel and Guyenne, in 1650. Mazarin's ingratitude to his late allies, the parliamentarians, caused all his adversaries to unite against him and in February 1651 he was obliged to go into exile near Cologne. His activity, however, was nowise at an end. He continued to direct the policy of Anne of Austria from his exile and, in September, rejoined the court at Poitiers, and soon afterward was about to enter Paris with it when he saw that his presence was an obstacle to the young king's entry to the capital. He again went into exile, in October 1652, but returned to Paris on 13 Feb. 1653, and through means of intrigue formed a powerful royal party in the state, gained General Turenne to his cause and returned to his position at court.

Untroubled now with troubles from within, Mazarin set about winding up the war with Spain. The outcome of this conflict remained in doubt until 1655, when French victory became assured through the alliance with Cromwell and the help of English soldiers. The Spaniards, beaten at the Dunes, at Dunkirk, threatened in the Netherlands and menaced at home by the capture of Barcelona, were obliged to sue for peace. By the Treaty of the Pyrénées (1658) the Spaniards lost to France, Roussillon, Artois and parts of the duchy of Luxembourg and of Hainaut. Not satisfied with this splendid result, Mazarin formed, in 1658, the League of the Rhine against Austria and diverted the succession to the throne of Spain by bringing about the marriage of Louis XIV with the Infanta Maria Theresa. With the completion of these projects his career ended. Mazarin was very avaricious, and through every kind of financial dealing amassed the huge fortune of over 50,000,000 livres. To the Royal Library he bequeathed his magnificent collection of books. He founded the Collège de Quatre-Nations, later known by his name as the Collège Mazarin. He has been blamed for the favors shown his family and the project, once entertained by him, of marrying his niece, Maria Mancini, to Louis XIV. These, however, are but the smaller side of a great character. They cannot make one forget the great political genius who extended the territory of France from the Pyrénées to the Rhine and which extricated her from a dangerous internal crisis. Consult Chéruel, 'Lettres du cardinal Mazarin pendant son ministère' (in 'Collection de documents inédits sur l'histoire de France,' Paris 1872–94); id., 'Histoire de France pendant la minorité de Louis XIV' (1879–80); id., 'Histoire de France sous le ministère de Mazarin' (1883); Chantelauze, 'Portraits historiques' (1886); Cousin, V., 'La jeunesse de Mazarin' (1865); Hassell, A., 'Mazarin' (1903); Perkins, J. B., 'France under Mazarin' (New York 1915).

MAZARRÓN, Spain, town, in the province of Murcia, 18 miles west of Cartagena and about three miles from the Mediterranean coast, with which it is connected by rail. It has flouring mills, soap works and metallurgic factories, and there are copper, iron and lead mines in the nearby mountains. A customhouse, barracks, lighthouse and lead works are situated on the coast. The town has a large trade in coal, lead and other ores. Pop. 18,000.

MAZATLAN, mä-sät-län', Mexico, a town and seaport of Sinaloa, about 183 miles southeast of the city of Sinaloa, at the entrance to the Gulf of California, on the Mexican Southern Pacific Railroad. It is built on a hilly crest and has a pleasing appearance. It has a municipal gas system and a street railway. Mazatlan is the chief Pacific port of Mexico and the outlet for the products of the mining district of Saint Sebastian; it has a considerable import and export trade. Silver, copper, lead, pearls and hides are exported. In 1914 the town was besieged by the Constitutionalists and taken after many months. A wireless station has been erected here. In normal times the exports amount annually to about $4,250,000 and the imports to $2,500,000.

MAZDAK, mäz'däk, Persian religious leader: b. Persepolis, about 470 A.D.; d. Nahrvan, between 530 and 540. He was a chief priest at Nishapur, and in 500 proclaimed himself a prophet. He preached the equality of man, the abolition of property rights and free love, abstinence from animal foods and the simple life generally. He converted King Kobad to his views, which forthwith became law, but a rising of the nobles ousted Kobad for three years, and on his return he abjured Mazdak and his doctrine. Khosru Nashirvan put him to death. Consult Browne, E. G., 'Literary History of Persia' (London 1909).

MAZE, Hippolyte, ē-pō-lēt maz, French historian: b. Arras, 5 Nov. 1839; d. Paris, 25 Oct. 1891. He studied at the Ecole Normale Supérieure; taught there and at the Lycée Fontanes; was elected prefect of Landes in 1870, deputy in 1879 and 1881 and senator in 1886. He wrote 'The Republic of the United States: Its Foundation' (1869); 'The End of the Revolution' (1872); 'Hoche in Vendée' (1882); 'The Struggle against Want' (1883); 'General Marceau' (1889), and 'The Generals of the Republic' (1889).

MAZEPPA, mä-zĕp'ä, **Ivan Stepanovitch, or John,** hetman of the Cossacks: b. Podolia, about 1645; d. Bender, Bessarabia, 1710. He was page to John Casimir, king of Poland, who was a patron of the arts and of literature, and he had therefore an opportunity of acquiring various useful accomplishments. A Polish nobleman having surprised Mazeppa with his wife bound him naked upon his own horse and committed him to his fate. The horse carried him to his own residence. Shame made him flee to the Ukraine and join the Cossacks, whose warlike roving life suited his disposition. He made himself conspicuous by his dexterity, bodily strength and courage. His knowledge and sagacity procured him the post of secretary to the hetman Samilovitch, and in 1689 he overthrew Samilovitch and himself became hetman. He gained the confidence of Peter the Great, who loaded him with honors and he was finally made Prince of the Ukraine. In 1706 he opened negotiations with Charles XII (q.v.) of Sweden for the purpose of freeing himself from Russian dominion, but his treachery was finally revealed to Peter, and he was obliged openly to declare for Charles. After the defeat of Pultowa in 1709 Mazeppa

fled to Bender. Peter tried to have the sultan extradite him, but failed despite an offer of 300,000 ducats for the favor. Lord Byron has made Mazeppa the hero of a poem (1818) and Liszt of a symphony.

MAZURKA, a lively Polish national dance, popular also in the United States. The movements are of a grotesque character. The term is also applied to the music which accompanies the dance, sometimes in three-eighths time, but for the most part in three-fourths. The mazurka is danced by four or eight couples. Augustus III brought the mazurka to Germany, whence it was learned by the French and finally about the middle of the 19th century it acquired considerable popularity in England. The music of the dance has taken its modern form from Chopin.

MAZZINI, Giuseppe, Italian patriot: b. Genoa, 22 June 1805; d. Pisa, 10 March 1872. He studied law at the University of Genoa and practised his profession for a time, but the strong Liberal opinions he had imbibed as a child and his conviction that the oppressed condition of his country under Austrian rule called for men of action and public spirit, and that a noble course lay open before anyone who would give himself up, heart and soul, to the work of reforming her, led him to devote himself to a political career. In his ardent aspirations for the national unity of Italy, it seemed to him that her deliverance from foreign tyranny was to be achieved only by a return to the republican glories of ancient times. His patriotic enthusiasm in this direction was fostered by his early studies, which developed in him a passionate idea of the glories of a republic, and by the success which he had achieved in literature while still little more than a youth. In 1827 appeared his maiden essay, 'Dell' Amor Patrio di Dante,' which was published in a Liberal journal, the *Subalpino.* This led him to contribute under the mask of literary critiques other historical, philosophical and critical papers to the *Antologia* of Florence and the *Indicatore Genovese.* But the authorities, perceiving that the periodical literature of Italy was becoming far too strongly tainted with advanced Liberal opinions, suppressed these journals, and hoped, no doubt, thereby to have silenced their writers also. About 1830 Mazzini became an active member of the Carbonari, and this affiliation was the introductory step to his subsequent political life; he was active, able, bold and impetuous, and he soon rose into a position which gave him great influence in the councils of that secret society. While on a mission for the society he was betrayed by a Piedmontese spy, arrested and detained for six months as a prisoner in the fortress of Savona. On his release he went to Marseilles, France, to escape the police surveillance imposed on him in Italy. Here he organized the society of La Giovine Italia (Young Italy), and established under that same title a journal to advocate his views; the purpose of the society was to liberate Italy and establish a national government, Mazzini desiring a republic. It was about this time, too, that he addressed to Charles Albert of Sardinia the celebrated letter which drew down on him a sentence of perpetual banishment from his native country. He took active part in the organization of an insurrection of which Genoa was to be th centre, but the plot was discovered and faile For his share in it Mazzini was sentenced death in the Sardinian courts. He then wer to Switzerland, where he organized anothe conspiracy for the invasion of Savoy (1834 which also failed. In 1837 he quitted Switze land and took up his abode in London, whe he kept in correspondence with the revolutio ary leaders on the Continent, was recognize as the head of the Young Italy party, and i stigated several insurrections, which were u successful. After the insurrection in Milan i 1848 he again went to Italy, was chosen a mem ber of the Tuscan provisional government i February 1849, and in the following mont when Rome was proclaimed a republic, he wa chosen first of the triumvirs. He was the mai spring of the defense of Rome against th French, and on the surrender of that city i June Mazzini escaped to Lausanne, Switze land. At this time he addressed to M. d Tocqueville and other French statesmen som most bitter and reproachful letters on the high handed policy pursued by France. Finding h continental residence too hot for him he re turned to London, not, however, with any ide of abandoning his long-cherished hopes fo Italian unity. Later he had a hand in the u successful uprisings at Mantua (1852), in Mila (1853) and in Piedmont (1857), being in Ital for a short time in 1857. He assisted also i organizing the expeditions led by Garibaldi i 1860, 1862 and 1867. An ardent Republica he refused to take his seat in the Italian Parli ment under the monarchy, though repeated elected from Messina, as a protest against th uncanceled sentence of death against him. I 1866 this sentence was formally rescinded; i 1868 he suffered from a serious illness, th effects of which left him in impaired healt In 1870 he was arrested at Gaeta under charg of conspiracy with Garibaldi and imprisone for two months, being released after the occu pation of Rome by the Italians. He was ac corded a public funeral by the Italian gover ment.

Mazzini was a copious writer. A perfe master not only of Italian, but of French an of English literature; he was an able com mentator of Dante, the author of works o philosophy and a constant contributor to som of the most delightful periodical literature i Paris and in London. He would turn fro the warfare of politics to write in his *Apo tolato Popolari* for the benefit of Italian wor men sermons 'On the Duties of Man.' H analyzed in masterly fashion the faults an shortcomings of the economic and socialis schools. Though his actions were som times politically indiscreet, he was a ma of attractive character and strong person magnetism, distinguished throughout his care for disinterested patriotism and the highe moral standards of conduct. He was interested the labor movement, organized a workingmen association in London in 1840 and was for time connected with the International Workin men's Association (q.v.), but withdrew fro that society when it declared for Socialis During his later life especially his efforts we directed toward separating republicanism fro both Socialism and atheism. No man won many admirers as Mazzini and yet secured

few friends. There was hardly a human being whom long familiarity had not estranged from Mazzini. With manners consummately affable and courteous he combined an overweening conceit and a narrowness and bigotry of view which hardly tolerated independent minds. He was a lonely genius, all apart from the common ways of other mortals, spurning the suggestions of the plainest common sense, professing to do all for his fellow-beings, yet nothing with them or by their aid. He gave up the idea of ever being a prophet in his own country in his own age; his only trust was in a coming generation, where the germ of his idea could alone attain full development. The best edition of his works is 'Scritti Editi ed Inediti' (18 vols., Milan 1861–91); a partial collection is published under the title 'Life and Writings of Joseph Mazzini' (1891). His letters have been published in English (6 vols., London 1890–91). Consult 'Memoir of Joseph Mazzini' (1877), containing his two essays 'Thoughts on Democracy in Europe,' and 'On the Duties of Man'; Linton, W. J., 'Recollections of Mazzini' (1892); Marriott, 'Makers of Modern Italy' (1889); MacCunn, J., 'Six Radical Thinkers' (London 1907); Holland, R. S., 'Builders of United Italy' (New York 1908); 'Cambridge Modern History' (Vol. XI, ib. 1909); King, Bolton, 'Life of Mazzini' (new ed., ib. 1912); King, H. E. B., 'Letters and Recollections of Mazzini' (London 1912); Thayer, 'The Dawn of Italian Independence' (1893); Martinengo-Cesaresco, 'Italian Characters.'

MAZZOLA, mat-so'la, or **MAZZUOLI,** mat-soo-ō'lä, **Francesco,** Italian painter, known from his birthplace as IL PARMIGIANO: b. Parma, 11 Jan. 1503; d. Casalmaggiore, 24 Aug. 1540. His father and two uncles were painters, and to them and to Correggio, who was in Parma in 1521, he owed his earlier training. Correggio's manner he caught so well that his 'Cupid Fashioning a Bow' was long and generally attributed to Correggio. When 20 he went to Rome and there imitated Raphael and Michelangelo. In 1527, upon the capture of Rome by Charles V, his losses were great and he had to escape from the city. He returned to Parma, lost his health, was imprisoned by the city authorities for failure to complete a commission which had been paid for in advance, and upon his release fled to Casalmaggiore, failing to live up to his promise to repay. His paintings are to be found in most of the galleries of Europe; mention should be made of the 'Madonna with St. Margaret,' in the Bologna Gallery; 'Madonna del Collo Lungo,' Pitti Palace, Florence; 'Annunciation,' Ambrosian Library, Milan; various portraits in the Naples Museum; several sacred subjects, notably 'Madonne' in the Dresden Gallery and in the Louvre; and the great frescoes in the church of Saint John, Parma. More important, though less well known, are Mazzola's etchings, since he introduced etching into Italy. His drawing is correct, and his work bold, fiery and graceful.

MAZZONI, Guido, gwē'dō mat-so'ne, Italian scholar and poet: b. Florence, 12 June 1859. He was educated at Florence, Leghorn and Bologna, in 1881 became instructor in Italian literature in secondary schools and in 1887 professor of Italian literature at Padua. After 1894 he was professor of the Italian language and literature at the Institute of Florence. His poetic work has been to some extent influenced by his familiarity with English literature and largely by his countryman Carducci. Besides contributions to reviews, he wrote 'Epigrammi di Meleagro da Cadora' (1880); 'In Biblioteca' (1882); 'Esperimenti metrici' (1882); 'Un Ritratto di Gesù' (1887); 'Rassegne litterarie' (1887); 'Fra Libri et Carte' (1887), and other works, including a scholarly history of Italian literature in the last century.

MEAD, Edwin Doak, American author and lecturer: b. Chesterfield, N. H., 29 Sept. 1849. His early life was spent on his father's farm, and in 1866 he entered the publishing house of Ticknor and Fields, Boston. He studied in English and German universities 1875–79, and afterward engaged in lecturing and writing. In 1889 he was associate editor of the *New England Magazine* with Edward Everett Hale, the chief editor, 1890–1901. He was connected with numerous historical and social clubs. For 25 years he was director of The Old South Historical Works; edited 200 Old South leaflets widely used in schools and colleges, and annually arranged courses of lectures. For several years he was president of the Massachusetts Good Citizenship Association and Free Religious Association, and for 10 years president of the Twentieth Century Club. He labored very earnestly in the cause of international peace. He was a trustee of the Church Peace Union, endowed by Mr. Carnegie, and was delegate to international peace congresses at Glasgow, Rouen, Lucerne, Munich and London. He published 'The Philosophy of Carlyle' (1881); 'Martin Luther: A Study of the Reformation' (1884); 'A More Beautiful Public Life'; 'Organize the World'; 'The Principles of the Founders'; 'The Influence of Emerson.' D. 17 Aug. 1937.

MEAD, Larkin Goldsmith, American sculptor: b. Chesterfield, N. H., 3 Jan. 1835; d. 15 Oct. 1910. He was educated in the public schools and studied art in Italy, where in Venice he was a member of the United States consulate. His first work was an ideal figure, 'The Recording Angel,' executed in 1855. He served for a time in the Civil War as illustrator for *Harper's Weekly,* and after the war his work as a sculptor gave him national prominence. The statue of Lincoln on the monument at Springfield, Ill., is his work, as are the bronze statues of Ethan Allen at the Capitol at Washington and in Montpelier, Vt. The latter city has also his heroic figure 'Vermont' on the State Capitol. He also executed the soldiers' monument at Saint Johnsbury, Vt.; the Stanford family group for Stanford University; 'The Mississippi River,' Minneapolis; portraits of W. D Howells, John Hay and Henry James. His work includes many ideal pieces: 'The Returned Soldier'; 'The Return of Proserpine from the Realm of Pluto' (exhibited at the World's Columbian Exposition), etc.

MEAD, William Rutherford, American architect: b. Brattleboro, Vt., 20 Aug. 1846. He was graduated from Amherst College in 1867, studied architecture in New York under Rus-

sell Sturgis and in Europe, and upon his return to the United States became a member of the prominent New York firm of McKim, Mead and White, which has had charge of many of the most important public and private buildings in the country. In 1902 he was made a Fellow of the American Institute of Architects, and was a member of the American Academy of Arts and Letters and president of the American Academy, Rome. In 1910 he was chosen member of the National Academy of Design and was awarded a gold medal of honor by the National Institute of Arts and Letters. He died in Paris, France, 20 June 1928.

MEAD, or **METH,** a vinous liquor, used in northern Europe and made of honey and water by means of digestion and fermentation. It also receives an addition of fruit, spices and simples to give it a richer flavor. When new, mead has always a strong taste of honey, but this diminishes as it becomes older. Mead is mixed with the must of apples or with wine, beer and even vinegar, and then takes the name of wine-mead, beer-mead, etc. It is one of the oldest of beverages, being known all over Europe within historic times.

MEADE, George Gordon, American soldier: b. Cadiz, Spain, 31 Dec. 1815; d. Philadelphia, 6 Nov. 1872. In 1835 he was graduated from the United States Military Academy and assigned to the 3d Artillery, in 1835–36 served in the Seminole War in Florida, on 26 Oct. 1836 resigned from the army, and in 1836–37 was assistant engineer in the construction of the Alabama, Florida and Georgia Railway. He was later employed in various works of engineering, including surveys of the mouths of the Mississippi and of the northeast boundary between the United States and British North America. On 19 May 1842 re-entered the army as second lieutenant of topographical engineers. He joined Scott's staff at Corpus Christi, Tex., 14 Sept. 1845, and during the Mexican War participated in the battles of Palo Alto, Monterey, Resaca de la Palma and the siege of Vera Cruz. After the war he was occupied in lighthouse construction and in the geodetic survey of the Great Lakes (1857–61). He became captain in the corps of engineers in 1856. On 31 Aug. 1861 he was commissioner brigadier-general of volunteers and assigned to the command of the 2d brigade of the Pennsylvania reserve corps of the Army of the Potomac, stationed on the right of the lines before Washington. He served in the Virginia peninsula campaign and took part in the actions at Mechanicsville (26 June), Gaines' Mill (27 June) and Frayser's Farm (30 June). On 18 June he was promoted major of engineers. At Manassas (second Bull Run) he commanded the 1st brigade of Reynold's division, and later he took a distinguished part at South Mountain (14 September) and Antietam (17 September). In the latter battle, when Hooker was wounded, he was placed in command of the First Corps. For his services he was promoted major-general of volunteers 29 Nov. 1862; and at Fredericksburg (13 December) commanded the 3d division of the First Corps, with which he broke through Lee's right and penetrated to the position occupied by the Confederate reserves, but for want of support was compelled to fall back. At Chancellorsville (2–4 May 1863) he commanded the Fift Corps. On 28 June 1863 he was appointe commander of the Army of the Potomac, t succeed Hooker. His command was then sca tered, and on the march through Pennsylvani in pursuit of the Confederate invaders. Mead had everything yet to learn of both his ow force and the enemy. At Gettysburg on 1–3 July he won the great and decisive battle wit which his name is generally associated. (Se Gettysburg, Battle of). He received th thanks of Congress and was made brigadie general, United States army, 3 July 1863. Du ing the remainder of the war he commande the Army of the Potomac with conspicuou ability, and on 18 Aug. 1864 became majo general in the regular army. From 1 July 186 until his death he was commander of the mil tary division of the Atlantic, with the excep tion of the period January 1868–March 186 when he was in command successively of th Third Military District and the Department o the South. He was a Fellow of the America Academy of Arts and Sciences. A residenc was purchased for him by the citizens of Phila delphia, and after his death $100,000 were co lected and given to his heirs. There is a equestrian statue of him by Calden in Fai mount Park, Philadelphia, and one by Bush Brown on the field of Gettysburg. Consu Bache, R. M., 'Life of General G. G. Meade' (Philadelphia 1897); Pennypacker, I. R., 'Ge eral Meade' (New York 1901).

MEADE, Richard Kidder, American so dier: b. Nansemond County, Va., 14 July 174 d. Frederic, now Clarke, County, after 180 He was educated in England at Harrow and i private schools. He had returned from En land some years before the outbreak of th Revolution, and in 1775 entered the service o the struggling colonies, and distinguished hin self in his first battle, that of Great Ridg Recognition came speedily with an appointme to the staff of General Washington, with who he remained until the close of the war. Th supervision of the execution of Major And fell to his lot, a duty which while recognizi the necessity for it, he performed with deep r gret. At the conclusion of the war he r turned to Virginia to engage in the quiet li of the plantation.

MEADE, Richard Worsam, American n val officer: b. New York, 9 Oct. 1837; d. Was ington, D. C., 4 May 1897. He was a nephe of Gen. G. G. Meade (q.v.). He entered th navy as midshipman 2 Oct. 1850. His promo tions were lieutenant, 23 Jan. 1858; lieutenan commander, 16 July 1862; commander, 20 Se 1868; captain, 13 March 1880; commodore, May 1892, and rear-admiral, 7 Sept. 1894. O 20 May 1895 he was retired from the servic In 1862–63 as commander of a division he c operated with the land forces of Sherman i subduing the Confederates on the Mississip In 1863 he was in command of the marines d ing the Draft Riots in New York. For a tir he was in charge of a department at the nav academy; in 1868 was sent to Alaska and t 1871–73 commanded the *Narragansett* on th Pacific station. In 1894 he was placed in com mand of the North Atlantic squadron. He w naval representative of the United States b the World's Columbian Exposition, Chicag

1893. He published 'A Treatise on Naval Architecture and Ship-building' (1869).

MEADE, William, American Protestant Episcopal bishop: b. near Millwood, Va., 11 Nov. 1789; d. Richmond, Va., 14 March 1862. He was a son of R. K. Meade (q.v.), and was graduated from Princeton College in 1808, studied theology and took orders in the Episcopal ministry in 1811. His first charge was his home parish, which he served gratuitously, and in 1829 he was elected assistant to Bishop Moore. He was in charge of Christ Church in Norfolk, Va., in 1834–36, and in 1841 succeeded Bishop Moore as head of the diocese of Virginia. He was one of the founders in 1847 of the 'Evangelical Knowledge Society.' He tried to keep Virginia in the Union in 1861, but later entered into the spirit and aims of the Confederacy. He was the author of several works, among which are 'Family Prayers' (1834); 'Reasons for Loving the Episcopal Church' (1852); 'Old Churches, Ministers and Families of Virginia' (1857); 'The Bible and the Classics' (1861). Consult the memoir by his coadjutor, John Johns (Baltimore 1867).

MEADOW, Making and Care of. Meadows may be divided into general groups which will depend upon location, duration and purpose, and their treatment will vary with each of these factors. Meadows located upon low ground, which may be inundated, or which is constantly moist, usually consist of grasses and other plants which do not thrive so well upon upland fields. Because of their dampness they cannot be treated like dry soils and they are therefore more frequently permanent than temporary. Further, they are generally better adapted for haying than for grazing, because the grasses that naturally grow upon them are ranker, taller growing species and generally have grown to a considerable height before the land becomes dry enough to turn stock upon it. Except as to season the preparation of lowland meadows is not necessarily different from that of upland.

For best results the land should be deeply plowed as early in the season as soil conditions will permit, and harrowed at intervals of 10 days and after each rain that forms a crust until late summer. The practice will not only destroy weeds and weed seeds, but ensure the quick germination of grass seed sown even in dry weather, the soil being moist close to the surface. The soil may be anything, but preferably not sand or clay. If mucky, as in a reclaimed swamp, rolling is frequently advisable, otherwise generally not. Prior to plowing liberal applications of good manure or commercial fertilizers should be made and light annual dressings should also be given, preferably in autumn or early spring. Temporary pastures which are intended to last only three or four years should constitute part of a general rotation scheme (see ROTATION OF CROPS) and should be followed by some crop such as corn or potatoes, which can best utilize their products of decomposition. Permanent meadows should be inspected each spring and the spots which appear to be failing given special attention, such as fertilizing, liming, seeding, etc., to maintain a general good average. When the annual yield of hay falls below two tons the meadow may be considered unprofitable and should be plowed up and given a change of crop for three or four years.

In general, timothy or "herd's-grass" is the most popular grass in America, because it is hardy, long-lived, large, easily cured and its seed inexpensive and likely to be free from weed seed. Orchard grass, tall meadow fescue, red-top, rye-grass and cat-grass are also often used, but are secondary. Blue-grass, which generally appears as a volunteer grass in permanent meadows, is rarely profitable as a hay grass, but is unequaled in the north as a pasture grass. These grasses may all be sown with a sparsely planted cereal which acts as a "nurse crop." But this practice is generally considered inexpedient. The admixture of clover, however, is generally highly desirable, since the clovers supply nitrogenous food to the grasses. Alsike clover is considered best for mixing with timothy since it is somewhat later in ripening than the other large clovers, which mature before the timothy can be profitably cut. Consult Wing, Joseph E., 'Meadows and Pastures' (Chicago 1911).

MEADOW-BEAUTY. See DEER-GRASS.

MEADOW FESCUE, a fescue-grass (*Festuca*). See GRASSES IN THE UNITED STATES.

MEADOW-GRASS. See BLUE-GRASS.

MEADOW-HEN, the American coot. See COOT.

MEADOW-LARK, or MEDLARK, a beautiful American starling (*Sturnella magna*), numerous in eastern United States as far west as the high central plains, where it is replaced by a variety (*S. neglecta*) remarkably different in song and some habits. It is about 11 inches long and tail five inches. The body is thick and stout, the legs large, the bill long and straight and the flight powerful. The upper parts are brown, marked with brownish-white, and the exposed portions of the wings and tail with transverse dark-brown bars; the under parts yellow, with a black crescent upon the breast, which is very distinctive as well as a handsome ornament. These birds receive their popular name "lark" from their terrestrial habits and way of singing in the air, uttering a loud sweet double call while circling upon fluttering wings above the meadow or grain-field where the nest is carefully concealed among the roots of the grasses. The eggs are white, profusely speckled with light red. The western variety has a longer, more vivacious and tuneful song than the eastern bird, and is justly accounted the finest songster of the open regions of the interior. These birds are migratory in the northern parts of their range, but most of them remain during the winter in the middle parts of the United States and southward, and in the autumn are often shot for market, although in most States such shooting is now prohibited by law. In the Southern States it is commonly called "old-field lark." The meadow-lark subsists both on insects and on seeds. In winter they often form groups, but in the fine seasons seldom more than two are seen together. Consult Coues, 'Birds of the Northwest' (Washington 1874).

MEADOW-MOUSE. See FIELD-MICE.

MEADOW PINK, or **MEADOW CAMPION,** the common cuckooflower (q.v.), or ragged robin (*Lychnis floscuculi*). See LYCHNIS.

MEADOW RUE, a plant of the crowfoot family and of the genus *Thalictrum.* These rues are erect perennial herbs, with much divided leaves and small flowers, usually in loose panicles. The genus contains about 75 species, scattered about the north temperate zone, of which the United States and Canada possess about 15 species. The early meadow rue (*T. dioicum*) is a slender, leafy species, of rocky woods, a foot or two in height, whose flowers, purplish and greenish with yellowish anthers, appear in April or May. The purple meadow rue (*T. dasycarpum*), common in New England woods, is distinguishable by its size (two to four feet tall), large bright-green, waxy leaves and purplish stem; the flowers form a greenish fleecy bloom. A third large species is the thick-leaved (*T. coriaceum*) of the Southern states, whose flowers are of different hues, the staminate flowers being white and showy, while the pistillate flowers, borne on separate plants, are purplish. The tall meadow rue (*T. polygamum*) towers to a height of 10 feet in favorable situations. All are fertilized mainly by the wind.

MEADOW SNIPE. See JACKSNIPE.

MEADOWSWEET, a well-known handsome European plant (*Filipendula ulmaria*) of the rose family. It grows by the sides of streams and in damp places, has pinnate leaves and stems two feet high bearing corymbs of white fragrant flowers. It is also called queen of the meadow.

MEADVILLE, mĕd′vĭl, city, Pennsylvania, seat of Crawford County, is located on French Creek, 33 miles south of Erie, on the Erie and the Bessemer and Lake Erie railroads. It has a radio station and two airports, one municipal and one private, and is the industrial center for a diversified farming and oil producing area. Its manufactured products include castings and bearings, industrial heating equipment, rayon yarns, slide fasteners, stereoscopes, lanterns and lantern slides. The Erie Railroad has repair shops here. Allegheny College is here. The Meadville Historical Society maintains a museum, and the community supports its own symphony orchestra. The old courthouse is said to have been the scene of the first direct primary election.

Meadville was first settled about 1788 as a fortified outpost by Major David Mead, a Revolutionary soldier, for whom it was named and whose home built in 1797 is a point of interest. It was incorporated as a borough in 1823, as a city in 1866, and has a modified form of commission government. Pop. (1950) 18,972.

MEAFORD, town, Canada, in Ontario Province, on Nottawasaga Bay, 20 miles west of Collingwood, on the Canadian National Railway, in a fine farming section of Grey County. It has a good harbor from which fishing is carried on, and there are beaches which attract summer residents. The town does a considerable trade as outfitter to Great Lakes shipping. Local industries include furniture factories, hardwood flooring mills, and several smaller industries. The town has churches, public and high schools, a public library, two weekly newspapers, two banks, and a board of trade. It takes its name from the birthplace in England of Admiral the Earl of St. Vincent (John Jervis), victor over Spain in the crucial naval battle of Cape St. Vincent (1797); several of its streets are also named after British naval officers. Pop. (1951) 3,178.

MEAGHER, mä′ĕr; -hĕr; -kĕr, **Thomas Francis,** Irish-American soldier: b. Waterford, Ireland, Aug. 23, 1823; d. near Fort Benton, Mont., July 1, 1867. He was educated at the Jesuit College, Clongowes Wood, Kildare, and at Stonyhurst College, near Preston, England. In 1845 he joined the Young Ireland party, which aimed at independence through armed revolution and became one of its most inflammatory speakers. He was sent on a mission by the Irish Confederation to the French provisional government in 1848, and soon after his return to Ireland was arrested on a charge of sedition. He was bailed, but on passage of the Treason Felony Act was rearrested and sentenced to death for treason. The sentence was commuted to life banishment, and he was sent to Tasmania in July 1849. In 1852 he escaped to the United States, where he became a naturalized citizen, studied law, was admitted to the bar, and practiced in New York City in 1856–1861. For some time also after 1856 he was editor of the *Irish News* of New York.

At the outbreak of the Civil War in 1861 Meagher organized a company of Zouaves which as part of the 69th New York Volunteers under command of Col. Michael Corcoran took part in the first battle of Bull Run. After three months' service he recruited the Irish Brigade in New York City and was made its commander. He fought bravely at Richmond, the second battle of Bull Run, Fredericksburg and Antietam, but after Chancellorsville found his command so reduced in numbers that he resigned. Early in 1864 he was reappointed brigadier general of volunteers and was assigned to the command of the military district of Etowah. The following January he joined the forces of Gen. William Tecumseh Sherman at Savannah, and was mustered out there at the close of the war. He was appointed secretary of Montana Territory in 1865, and for about a year acted as temporary governor. At Fort Benton, Mont., on July 1, 1867 he boarded a steamer for an inspection trip down the Missouri and thereafter was never seen. It is supposed that he fell overboard unperceived during the night. He published *Speeches on the Legislative Independence of Ireland* (1853); *The Last Days of the 69th in Virginia* (1861).

Consult Cavanagh, Michael, *Memoirs of Gen. Thomas Francis Meagher* (1892); Bowers, C. G., *The Irish Orators* (1916).

MEAGRE. A fish. See MAIGRE.

MEAKIN, mē′kĭn, **James Edward Budgett,** English author and social reformer: b. London, Aug. 8, 1866; d. there, June 26, 1906. He was educated at Reigate grammar school. He was editor 1884–1893 of the *Times of Morocco,* a newspaper established by his father, and is best known for his books on the Moors. He was also interested in social reform and slum removal in England and organized the Shaftesbury Lectures. Among his works are *The Moorish Empire* (1899); *The Land of the Moors* (1901); *The Moors* (1902).

MEAL-MOTH, or MEAL-WORM. See FLOUR AND MEAL INSECTS.

MEAL-TUB PLOT, *in English history,* an alleged conspiracy, concocted in 1679 by an informer, Dangerfield, with the view of cutting off those who were opposed to the succession of James II after he had embraced Roman Catholicism. The false charges to which Dangerfield was prepared to swear were found in the meal-tub belonging to a Mrs. Cellier, one of his friends. Ultimately he confessed his crime, was whipped and condemned to stand in the pillory.

MEALY-BUG, a scaleless scale insect of the genus *Dactylopius* and family *Coccidæ.* These insects are covered with a mealy or waxy substance which they secrete for protective purposes. Like their relatives, the true scale insects, they also secrete honey-dew and are attended and transported by ants; unlike these relatives they do not lose the power of locomotion. The species are most numerous in tropical and sub-tropical countries; one species (*D. citri*) being the best-known outdoor species in the United States, feeding upon citrus trees in Florida. In greenhouses another species (*D. destructor*) is often troublesome. Owing to the protective covering difficulty has been met in ridding plants of these creatures, but fumigation and caustic solutions have been tried with most satisfactory results, a kerosene and soap emulsion being particularly effective in destroying them. (See INSECTICIDE). Consult Comstock, J. H. and A. B., 'Manual for the Study of Insects' (8th ed., New York 1909); Comstock, J. H., 'Report of the United States Department of Agriculture' (Washington 1880).

MEALY WING, a minute bug of the family *Aleyrodidæ,* whose species (about 150 in number) have the wings covered with a white meal-like secretion. They are allied to the coccids, but differ in development and structural peculiarities; and throng upon the leaves of plants which they injure by sucking away the sap and also by attracting a growth of smut-fungus by their secretion of honey-dew. In this manner they blacken and harm orange and lemon trees in parts of Florida and Louisiana, where they are prevalent. Consult Howard, 'Insect Book' (1901).

MEAN VALUE. If n quantities are commensurable, the sum of their units divided by n, the number of the quantities, is the *arithmetical mean* and is the *mean value* of the n quantities when their number is finite. For example, if the number of units in three quantities are respectively 4, 8 and 15, the mean value is $\frac{4+8+15}{3}=9$; and in general, if the number of units in n quantities is denoted by $X_1, X_2, X_3, \ldots X_n$, the mean value is

$$M=\frac{1}{n}(X_1+X_2+X_3+\ldots+X_n).$$

But if a quantity vary continuously in accordance with some law, thereby assuming every possible value between two extremes, the number of different quantities is infinite, and the mean value in such a case requires a new definition. For example, assume that at every point in the diameter of a semi-circle a perpendicular to the diameter is drawn to meet the semi-circle. The lengths of these lines form a continuous series of values represented by every number from zero to r, where r is the length of the radius. In such a case if n values of the perpendiculars are obtained and their sum is divided by n, the ratio should approximate to the mean value. It is easy to see, however, that this ratio will approximate to $\frac{2}{\pi}$ of the radius of the circle if the n perpendiculars are evenly spaced on the circle, to $\frac{\pi}{4}$ of the radius if they are evenly spaced on the diameter. It follows that the mean value of a continuously varying quantity is not definite until the law is known by which the «weight» of each portion of the scope of variation is determined.

The several forms of the theorem that pass under the name of the mean value theorem involve the principles of the infinitesimal calculus. The *first theorem of the mean value* is the following: Let $f(x)$ denote any finite and continuous function of x in the interval between $x=x_0$ and $x=X$; let dx denote the increment and retain the same sign in this interval; and assume that m and M are respectively the least and the greatest values of $f(x)$ in this interval: then the definite integral $\int_{x_0}^{X} f(x)dx$ has a definite value that is greater than $m(X-x_0)$ and less than $M(X-x_0)$; that is,

$$m\int_{x_0}^{X}dx<\int_{x_0}^{X}f(x)dx<M\int_{x_0}^{X}dx.$$

Since $f(x)$ is continuous in the interval $X-x_0$, there must be a value $x=\xi$, where $x_0<\xi<X$ such that $\int_{x_0}^{X} f(x)dx=(X-x_0)f(\xi)$, $m<f(\xi)<M$. The value, $f(\xi)=\frac{1}{X_0-x}\int_{x_0}^{X} f(x)dx$, is called the *mean value* of $f(x)$ in the interval $X-x_0$. If we assume $F(x)$ to be the primitive or indefinite integral of $f(x)$, then $F(X)-F(x_0)=(X-x_0)f(\xi)=(X-x_0)F(\xi)$ which is the familiar form of the law of the mean in the differential calculus.

The theorem of mean value is of importance in establishing Taylor's series. It follows immediately from the theorem of mean value that if $F(X)=F(x_0)=0$, for some ξ between X and x_0. $F'(\xi)=0$, if F is continuous between X and x_0. Let ϕ be a function of X with derivatives of every order at every point between $x=a$ and $x=b$. Construct the function

$$\psi(z)=\phi(X)-\phi(z)-(X-z)\phi'(z)-\frac{(x-z)^2}{a!}\phi''(z)$$
$$-\ldots.-\frac{(x-z)^n}{n!}\phi(n)(z)-\frac{(x-z)^{n+1}}{n+1}p,$$

where X is of the form x_0+h, and X and x_0 lie between a and b. ψ' will be of the form $-\phi'(z)+\phi'(z)-(X-z)\phi''(z)+(X-z)\phi''(z)-\ldots-\frac{(X-z)^n}{n!}\phi(n+1)z+\frac{(X-z)^n}{n!}p$, or

$$\frac{(X-z)^n}{n!}[p-\phi^{(n+1)}(z)].$$

Furthermore, $\psi(X)$ is identically 0, and by properly choosing P, $\psi(x_0)$ can be made 0.

Therefore, by the theorem just stated $\psi'(z) = \frac{(X-z)^n}{n!}[p-\phi^{(n+1)}(z)]$ vanishes for some value of z between x_0 and x. As it can be shown that this value need not be X itself, we have $p-\phi^{(n+1)}(z)=0$ for some value of z between x_0 and X, and since $\psi(X)=0$, if we let $X=x_0+h$, we have $\phi(x_0+h)=\phi(x_0)+\phi'(x_0)h+\ldots+\frac{\phi^{(n)}(x_0)}{n!}h^n+\frac{\phi^{(n+1)}(x_0+\vartheta h)}{(n+1)!}h^{n+1}$, where $0<\vartheta<1$. Therefore, if $\frac{\phi^{(n+1)}(x_0+\vartheta h)}{(n+1)!}h^{n+1}$ can be made as small as you please by increasing n, we have $\phi(x_0+h)=\sum_0^\infty \frac{\phi^{(n)}(x_0)h^n}{n!}$, which is Taylor's theorem. See SERIES. Consult Osgood, 'Differential and Integral Calculus' (rev. ed., New York 1914).

MEANDER, mē-ăn'dẽr, *in art,* an ornamental design, in which the lines interlace; it is often used in decorating vases. The lines usually advance in one direction and pass one another at right angles. The design is so named from the river Meander, well known for its numerous windings.

MEANDERS, broad swinging curves made by a river on its flood plain. A river in its early history may have accidental curves, but it is only when it has cut its course as deeply as it can, and has begun to widen its valley notably, in other words when it has passed its maturity and is progressing toward old age, that it characteristically develops meanders. These frequently become almost perfect loops many miles around and but a few rods across the neck. When a meander cuts off and is occupied by stagnant water only, ox-bow lakes are formed. If a region in this stage is uplifted the river will again begin to deepen its valley, and the meander curves will cut down anew, forming deep valleys or gorges. They are then said to be entrenched or incised meanders. Sometimes the neck of an incised meander may be cut through at river level, by undermining the rock, leaving a natural bridge. See NATURAL BRIDGE, and the section on *Work of Running Water* in the article on GEOLOGY.

MEANING, the object of a symbolization, considered from the standpoint of the symbol. Thus the meaning of the figure 2 is the number two, the meaning of the formula $(x+y)^2=x^2+2xy+y^2$ is the law that formula represents, and so on indefinitely. The experiences which we undergo possess besides their presented content a represented content, and this represented content bears toward them the relation of meaning. One of the cardinal problems of modern psychology is the determination of the psychical concomitants of this meaning. In accordance with the general nominalistic and associationalistic trend of experimental psychology, those who approach the question of meaning from this angle have usually considered that the meaning of an image is conveyed in consciousness by a group of such accompanying substantive states as images, sensations and feelings. They held, that is, that the meaning of "bear" read into a noise in the woods is "carried by a verbal image and an organic shudder," and that every experience is surrounded by a fringe of vaguer meaningful states. They would consider that the vehicle of the law of universal gravitation is a visual or auditory verbal image, together with certain organic and kinæsthetic sensations.

All this psychology of meaning suffers from the lack of an antecedent logical analysis. The logical situation best adapted to this analysis is that of the relation of a set of mathematical symbols to the theory they represent. The theory is obviously the meaning of the symbols, but it is only to the very slightest extent carried by the individual symbols themselves. Only the elementary constituents of the system together with certain of the simpler general notions, are represented by special characters. The structural relations are signified, and must be signified, by the arrangement — that is, the structural relations of the symbolism on the paper. The essence of the conventional system of algebraic notation lies, not in the use of letters for numbers, not in the symbolizing of addition by + and of multiplication by ×, but in the agreement between the laws of the manipulation of the symbols and the laws of number. Symbolization is primarily the relation toward a system of entities of a similarly order system of arbitrary marks, and only in a derived sense the relation between a mark and the corresponding entity. The symbol is a symbol only within a symbolism. It is precisely as a symbolism that our verbal images, kinæsthetic sensations and other mental states convey a meaning. When the mathematician is developing a new theorem, his mental content may be inventories as a verbal image or two, his sensation of the paper and pencil in front of him, and a few organic sensations. Somehow or other he puts these into an entirely extraneous correlation with the entities which he is examining. This strain behind the eyeballs acquires a temporary association with the unknown function for which he is seeking; that fragmentary visual image of a formula represents a mathematical law; and so on. In his trained mind, the symbolism of his states shapes itself into the desired conclusion, which he symbolizes anew in the conventional algebraic notation on the paper lying before him. No enumeration of his substantive states can ever disclose how the meaning of the conclusion and the premises is carried in his mind, for it is not these states themselves, but their arrangements, that are the vehicles of meaning.

This structural nature of the vehicle of meaning is intimately connected with our power to communicate with others. My sensation of red is something that as far as I know may be peculiarly mine. If there were a man who from his birth had seen red where I see green and green where I see red, it would be a matter of the utmost difficulty for me to detect his anomaly. He would learn the name "red" from hearing it applied to the things which appear red to me but green to him, so that his speech would not disclose his peculiarity. It is only by observing that green objects excite in him the expression of the emotions which we consider appropriate to red, or by some similar peculiarity in the associations of his experience of red and green objects, that the interchange of red and green sensations could even be sus-

pected. If the interchange were his sole peculiarity, he would always consider himself, and be considered by others, in the light of a normal human being. Accordingly, we have no reason to believe that the sensory qualities or sense-data of normal human beings agree with our own sensory qualities and sense-data, and there is no way of conveying these qualities and data by language. On the other hand, language is the vehicle of meaning and of nothing else. This alone is enough to prove that the meanings do not reside in any special data or qualities in our minds. What language does is to order the mind of the hearer or reader in a manner similar to that of the speaker or writer. In reading a story we pass through a sequence of mental states which has been designed for us by the author, though our individual states are beyond his knowledge. When he uses the word "green," we interpret it in our own way, but we put it in the same sort of relational context—complementary color of red, intermediate between yellow and blue, etc.—as that which it occupies in his mind. It, therefore, follows that this relational context, which is all that language can convey, is identically the meaning conveyed by language.

The situation when we hear a noise in the bushes and interpret it as "bear" can now be analyzed. The meaning is not carried in the first instance by the verbal image and the shudder. It is true that there is a possible state of consciousness in which the rustle in the bushes, the verbal image, and the shudder are all that is present, but at this stage meaning has not yet appeared. Meaning first appears when we think, not "bear," but "That's a bear." In this case, the rustle in the bushes stands for "that," the shudder or verbal image for "bear" and the juxtaposition of the shudder or image with the sound impression for the relation expressed in the sentence. The meaning of "bear" is derived from the meaning of the sentence. In other words, the meaning of the sound in the bushes resides, not in its correlates, but in its correlation. (See THOUGHT). Consult James, W., *Principles of Psychology* (New York 1899); Stout, G. F., *Manual of Psychology* (London 1913); Titchener, E. B., *Experimental Psychology of the Thought Processes* (New York 1909).

NORBERT WIENER.

MEANS, David MacGregor, American lawyer: b. Groton, Mass., May 1, 1847; d. May 24 1931. He was graduated from Yale in 1868, studied theology at Andover and New Haven, was professor of economics in Middlebury (Vt.) College in 1877–1880, and in 1881 was admitted to the bar and entered the practice of law. He contributed to periodicals, and wrote *The Boss* (1894); *Industrial Freedom* (1897); *The Methods of Taxation* (1909).

MEANS GRASS. See GRASSES IN THE UNITED STATES.

MEANTONE, or MESOTONIC TEMPERAMENT, *in music,* the system or principle of tuning voices or instruments in vogue up to the middle of the 19th century, when it was superseded by the system of equal or even temperament. In the meantone temperament, tuning was based on the use of a standard whole step or mean tone, which is an interval between a greater and a less major second. See MODE; WELL-TEMPERED CLAVIER.

MEARES, mērz, **John,** English navigator: b. England, 1756; d. London, 1809. He entered upon a seafaring life at an early age and in 1771 he entered the navy and served in the war with the French until peace was declared in 1783, when he became a captain in the merchant service. In 1786 he explored the coast of Alaska and made in 1789 a second tour of exploration on the discoveries of which the British government based its claim to the possession of British Columbia and Oregon. Three ships sent by him to Nootka Sound in 1789 were captured by the Spaniards and this act caused England to fit out an expedition in the following year, upon which reparation was made by Spain. He was the author of *Voyages in the Years 1788–89, from China to the Northwest Coast of America* (1790).

MEARIM RIVER, Brazil, rises in the Sierra do Negro, and after a northerly course of about 360 miles in the state of Maranhão flows into the Bay of São Marcos near the city of Maranhão. It has numerous affluents and is navigable, but the sudden tidal bores are dangerous.

MEARS, Helen Farnsworth, American sculptor: b. Oshkosh, Wis., Dec. 21, 1876; d. Feb. 17, 1916. Her early years were passed in Oshkosh, Wis., where she began her art work as a child by carving a life-size portrait of her sister from a block of solid plaster. She studied under Augustus Saint-Gaudens, who recommended her as one of the strongest pupils he ever had when he sent her to Frederick MacMonnies in Paris. She was particularly known for her portrait busts. Her memorial statue to Frances E. Willard in the capitol at Washington (1905) was the first statue of a woman by a woman placed in that building. In 1911 her design was accepted for a statue for the new Wisconsin State House. Before that she had done much work of note, including the MacDowell bas-reliefs, *The Fountain of Life,* which won a prize at the Saint Louis exposition. Other works are the portrait relief of Augustus Saint-Gaudens and the portrait busts of George Rogers Clark and William L. G. Morton.

MEASLES [Rubella, morbilli]. An acute infectious and contagious disease whose etiology has not yet been demonstrated although it is regarded as due to a filtrable virus. It is most often observed during childhood before the 16th year. The disease is characterized by a rather slow onset, the incubation period being about two weeks. The symptoms begin with irritability, malaise, fever, loss of appetite, and frequently vomiting. The skin eruption, so characteristic of the ailment, appears in about two or three days in the form of reddish spots on the palate and mucous membranes of the cheeks and lips, the latter showing small bluish spots surrounded by a reddish margin, the so-called Koplik's spots. About the fourth day the rash appears, first on the face, and then spreading to the body and limbs. It is a characteristic maculo-papular, dark red, eruption, the macules or larger patches tending to coalesce so that in certain areas at the height of the disease. very little normal skin can

be seen. At this time there usually will be present, running at the nose, discharge from the eyes, and intolerance to light. Occasionally a violent cough will be a troublesome symptom. Within a few days the rash fades, finally becoming a brownish discoloration of the skin, with some desquamation. Fever may reach 104° or more at the onset but falls within a day or two, only to rise again with the appearance of the eruption, again falling to the normal within a week.

The disease is found almost everywhere and in crowded centers may reach epidemic proportions. It is rather uncommon in tropical countries at the present time and if found is generally mild and without severe complications. At one time, however, in the South Sea Islands, it decimated whole populations.

Usually measles is not difficult of diagnosis. The premonitory symptoms may not attract attention and this causes the disease to be conveyed easily, for this is precisely the time when it is most apt to be spread to others unless the case be isolated promptly. Drug rashes are occasionally mistaken for measles but once the skin eruption is full blown there is little likelihood of a mistake. The complications are many, and secondary diseases, such as severe bronchitis, pneumonia, and middle ear infections occur in a considerable proportion of cases. The prognosis is good and the mortality is probably considerably less than 5 per cent, the rate varying according to locality and virulence of particular epidemics. There is no specific treatment although some success has been achieved in prevention by the use of convalescent sera, concentrated placental globulin and other biologicals. Quarantine is usually enforced for two weeks from the onset. Rest in bed, with proper ventilation, is essential and the room should be darkened. Local symptoms are dealt with as they appear. Proper nursing, not necessarily by a graduate nurse, is important. The attending physician will ordinarily examine the throat and ears at each visit, to detect complications. The bowels should be kept open and a bland diet adhered to as long as the fever continues. A severe laryngitis should be looked upon as a possible indication of a complicating diphtheria and should be treated accordingly.

HAROLD W. JONES, M.D.

MEASURE, a definite unit of capacity or extent, fixed by law or custom, by which relative sizes and capacities are ascertained and expressed; as, a yard, a measure of length; a gallon, a measure of capacity; a square foot, a measure of area; a cubic foot, a measure of volume, etc. See WEIGHTS AND MEASURES.

Lineal Measure.—The measure of lines or distances; the standard unit of lineal measure in the United States is the yard. The system is based on the law of nature that the force of gravity is constant at the same point of the earth's surface, and, consequently, that the length of a pendulum which oscillates a certain number of times in a given period is also constant.

Unit of Measure.—A given quantity, used as a standard of comparison in measuring a quantity of the same kind. Every kind of quantity has its own unit of measure, and under different circumstances the same kind of quantity may have different units of measure.

Line of Measures.—The line of intersection of the primitive plane, with a plane passing through the axis of the primitive circle and the axis of the circle to be projected.

Measure of Angles.—The right angle being taken as the angular unit, its subdivisions are degrees, minutes and seconds. The right angle contains 90 degrees, the degree 60 minutes and the minutes 60 seconds. All smaller fractions are expressed decimally in terms of the second.

Measure of Magnification.—The measure of magnification, or magnifying power of any optical instrument, is the ratio of the magnitude of the image to the magnitude of the object, or, more precisely, the ratio of the apparent diameter of the image to that of the object.

Measure of a Ratio.—Its logarithm, in any system of logarithms, or the exponent of the power to which the ratio is equal, the exponent of some given ratio being assumed as unity.

In Music.—The quantity of notes which are placed in the bar, and which is generally called the time, of which there are but two kinds, namely, common time, containing an equal quantity of notes in the bar, and triple time, containing an unequal quantity. Common time is generally marked with a C at the beginning, which means that every bar contains four crotchets, or their value in other notes. There are also other kinds of common time which are marked 2/4, 6/4, 9/8. Triple time is marked 3/2, 3/4, 3/8, 9/8, 9/4.

MEASURE FOR MEASURE is the most characteristic of the group of so-called "dark comedies" produced in Shakespeare's middle period. Modern critics are agreed that *Measure for Measure,* first printed in the 1623 folio, must have been composed about 1603; and the critics' opinion, based almost solely upon evidence of style, can now be confidently supported by a piece of external evidence lately redeemed from suspicion of forgery; namely, a memorandum in the accounts of the royal Revels Office which records that *Measure for Measure* by Shaxberd was performed before King James by His Majesty's Players on Saint Stephen's night, Dec. 26, 1604. Few of Shakespeare's greater works are so unequal in quality or have evoked such diverse opinions. In certain details of form it is one of the most careless of the plays. The subject is intrinsically displeasing to modern taste (though vastly more refined here than in the original story); several of the characters (notably the goody-goody duke and the unmanly Claudio) repel the reader; and many of the devices of plot, especially in the perfunctory closing acts, are frank clap-trap. On the other hand, Shakespeare's moral beauty and dramatic brilliance are nowhere more loftily exemplified than in the best scenes—those, namely, in which Isabella's gracious figure appears. In a word, this play marks, and is the first to mark, the complete ascendency of spirit over form so notable in the last plays of 8 or 10 years later; it is the earliest to make conspicuous Shakespeare's utter heedlessness of rules and details and his uncanny splendor in silhouetting moral beauty against an all-encompassing mundane vileness. "This is a play as full of genius as it is of wisdom," says Hazlitt, and Masefield in a notable appreciation calls it "one of the greatest works of the greatest English mind." There is no evidence that *Measure for Measure* has ever been much performed (except in Germany), though an injudicious attempt to blend it with *Much Ado about Nothing* (*The*

Law against Lovers,' by Sir William Davenant) was popular in the latter half of the 17th century. Yet two English revivals in 1907 and 1908 (one by the company of Oscar Ashe and Lily Brayton, the other by the Oxford University Dramatic Society, supported by actresses) proved marvelously impressive. They fully established both the serene morality of the piece when honestly presented and also the genuine effectiveness of the usually slighted comic scenes. Shakespeare's source was a long, flashy play in two parts (10 acts), 'Promos and Cassandra,' by George Whetstone (1578), which in its turn is derived from an Italian tale in Cinthio's 'Hecatommithi.'

TUCKER BROOKE.

MEASUREMENT OF SHIPS FOR TONNAGE, or BUILDER'S MEASUREMENT, a method of computing the tonnage of merchant vessels, in use among shipbuilders. Its results are nearly double the legal or registered tonnage. See TONNAGE.

MEASUREMENT OF STREAMS. One of the many useful classes of work conducted by the United States Geological Survey; the measurement of streams having an industrial value. Wherever water is likely to be employed for power or irrigation the amount available is ascertained by that bureau. The volume varies greatly from season to season, and sometimes from year to year. Any calculation by the manufacturer or farmer which does not take this variability into account would be misleading. Moreover, streams differ among themselves in straightness, the character of their beds and other particulars. Accurate measurement is still further complicated by the lack of uniformity in the movement in a given cross section. What might be true for one point would not be true for other points to the right or left of it, or at a higher or lower level.

The first step in the work is to place a gauge in a permanent position, and employ a suitable observer to read it every day. The gauge is graduated to feet and tenths. Usually it is upright. It may be laid over slanting, however. In that case, the spacing is widened, so as to give accurate results. One observation a day is made, and its results transmitted on a postal card to Washington. The second factor in the hydrographer's computation is the velocity of the stream, at different heights. To ascertain this only occasional measurements are necessary. These are made by experts, but with their aid it is possible to prepare tables showing the total discharge of that particular stream for all the different gauge readings. After such tabulation is effected the maximum, minimum and mean flow for any month in the year can be told at a glance.

Velocity is ascertained with a meter lowered into the water. The instrument contains a tiny screw propeller, the number of whose rotations under the pressure of the fluid is automatically registered. Many types of meter have been devised. The kind which the bureau prefers has an electric wire leading up to a buzzer in the operator's pocket. There a click or other audible sound indicates to him the speed of the screw. He counts the number of revolutions for some definite period, usually fifty seconds, records it in his notebook and moves along a short distance to make another observation.

If measurements are made at various depths along a vertical line, the results will not be equal. For this reason hydrographers have studied to find, if possible, a level that would fairly represent the average velocity for any vertical. In this way they can simplify the labor. It has been found that such an average can be secured by taking the speed at a depth of from six-tenths to two-thirds of the way down from the surface. To obtain a correct idea for the whole stream, though, these tests must be made at a number of places between one shore and the other. No measurement at a single point can be trusted to be fairly representative.

MEASURING WORM, INCH WORM, LOOPER, or SPAN-WORM, a caterpillar of any species of moth of the superfamily *Geometridæ.* The creatures are characterized by the presence of only two pairs of abdominal legs, one upon the ninth, the other upon the anal segment, and by their peculiar form of locomotion, the rear of the body being brought forward toward the front legs and the body forming a loop at right angles to the surface upon which the insects walk. Nearly all the numerous species feed upon foliage, a few upon seeds in which they bore. Some are considered serious pests in orchards and upon shade trees; for instance, the canker worms (see APPLE, *Insects*), the lime-tree moth (*Hybernia tiliaria*), and *Cymatophora pampinaria,* which sometimes devastates cranberry plantations. The duration of the larva state is variable; from their great voracity they grow rapidly and shed their skins several times before attaining maturity; when arrived at this state they seek some sheltered spot in which to undergo the change to pupa form, some clinging to the lower surfaces of leaves while others bury themselves in the earth, those remaining in the air suspending themselves in various ways by means of their silky secretions, others enclosing themselves in silky cocoons. Those burying themselves also build cocoons around them, but many of these only line their cavity with enough silken threads to keep the wall from falling in. One of the European species, *Fidonia Plumistaria,* is distinguished by curious feathery antennæ. The caterpillars of this species are very injurious to fruit trees, especially those of the European magpie moth, *Abraxas grossulariata,* which inhabit gooseberry bushes, often entirely stripping them of their foliage. The caterpillar of the American canker worm moth. *Anisopteryx pometaria,* also belongs to this species of worm, the eggs being hatched in the spring; when grown they are about an inch long and of various colors, and are also dangerous to orchards. Most of the species, however, are of small economic importance. The caterpillars usually resemble twigs when at rest, their protective coloring and their attitudes serving to deceive their enemies. The caterpillars of a few species of the owlet moths, family *Noctuidæ,* walk in this way, since they also lack prolegs upon the middle abdominal segments. They are not, however, considered true measuring worms. The geometrid moths are usually of small size and inconspicuous but delicate and beautiful coloration. Consult Holland, 'The Moth Book' (New York 1903); and Packard's 'Monograph of the Geometridæ,' with colored plates, published by the United States Geological Survey (Washing-

ton 1876); *Cambridge Natural History,* vol. 6 (London 1899); Comstock, J. H. and A. B., *Manual for the Study of Insects,* 8th ed. (Ithaca, N. Y., 1909).

MEAT, in general, the flesh of animals intended or prepared for food, especially the meat of cattle, calves, sheep, lambs, and swine. For the convenience of our readers this series of articles is divided into four sections as follows:

1. Meats and Meat Production
2. Meat, Inspection of
3. Meat, Market Classes and Grades
4. Meat Packing.

1. MEATS AND MEAT PRODUCTION. There are scores of individual retail fresh beef, pork, veal, and lamb cuts, and more than 100 different kinds of fresh, cured, and smoked sausage products which may be obtained from the dressed sides of steers, hogs, calves, and lambs. Approximately 21,349,000,000 pounds of beef, pork, veal, and lamb were produced by American meat packers in 1948 which provided a consumption of 145 pounds per capita, plus a substantial volume of exports.

Meat as a food supplies quantities of high quality protein, an abundance of certain mineral elements, varying amounts of energy, and some of the vitamins.

Protein is one of the most important substances present in all living things. Without it, just as without water, certain mineral matter, and other more mysterious things, life would be impossible. Lean meat, for example, is one kind of protein. It contains water also, but most of the solid substance in it is protein. We need protein in order to grow, to be strong and healthy, and to repair our body substance. Protein takes part in almost all of the body functions.

Meat is rich in protein, but there are many shades of meaning applicable to the word protein. Meat, eggs, and milk provide complete protein; that is, protein containing all of the substances called amino acids that are necessary to life. Beans, peas, and cereals have less complete proteins. Fat meats contain protein, but the more fat they have the less proteins they contain. A clear salt pork contains very little protein but large amounts of energy and heat-yielding fats. Medium fat meats contain about two thirds as much protein as lean meats, and fatter meats contain about one half as much as lean meats, or even less when the proportion of fat is very large.

The protein of one food differs greatly from that of another. Each protein is made up of amino acids which are often referred to as building stones. In the process of digestion, proteins are broken up into these building stones and the nutritive value of protein depends upon the amino acids that are formed. Some, being absolutely necessary for body growth, repair, and maintenance, can be made by the body itself, while others cannot. The latter are called essential amino acids because they must be supplied by the food. Proteins of animal origin—meat—contain greater proportions of these necessary amino acids than do those of vegetable origin. They are of higher quality and are known as "adequate proteins."

Lean meat furnishes modest amounts of energy which we measure in calories. Meats containing some fat are richer sources of this energy, and very fat meats, such as bacon and salt pork, are among the richest sources of energy. Meat protein, as well as other proteins, can serve for repair material and fuel at the same time. When used as repair material, it is replacing a worn-out part of the body. The worn-out material is then used for fuel. The result is the same as though the meat protein were being used for both purposes.

Minerals are another nutrient to be found in meat. Lean meat furnishes mineral matter in amounts greater than does the average food. Liver, sweetbreads, and similar edible parts are rich in minerals (iron, calcium, and phosphorus). The human system needs mineral matter to build good teeth, and bones. In fact, every part of man needs certain mineral matter if it is to work properly. He needs calcium and phosphorus for bone especially, and iron for red blood, but we also need potassium, sodium, chlorine and a number of other minerals. The leaner meats and edible grades furnish almost all the minerals that the body uses, except calcium. Meat is rather rich in phosphorus needed for bones, for the brain, and, indeed, for all parts of the body. It is also one of the common foods richest in iron. However, it contains but small amounts of calcium—an element necessary for bones and teeth. Foods containing greater quantities of calcium than does meat are milk, spinach, cauliflower, cabbage, and other green leafy vegetables.

Certain meats have appreciable amounts of vitamins. All meats contain some vitamin A, and liver has this nutrient in large quantities. Pork, either fresh, cured, or cooked, provides vitamin B. Vitamin B is also present in other lean meat. Vitamin C is found in liver and kidney especially. A piece of fresh ham or fresh beef contains all of the vitamins. The fat has vitamin A and the muscle or lean, the others.

Since livestock comes to market in varying quantities from day to day, and season to season, it is not possible for meat-packing companies to process the same number of live animals daily or to ship a constant tonnage of meat. Meat production during the winter months, for example, is substantially larger than during the summer months. For this reason, the storage of meat products is an important factor in the industry. Because of the perishability of meat, storage facilities must be refrigerated. A large part of the meat in storage at any given time consists of products that are undergoing curing and smoking, but storage stocks usually represent only the equivalent of two or three weeks' meats supply.

The shortest possible time should elapse between the slaughtering of a live animal and its entrance into the cooler. The more quickly the animal is dressed and placed in the cooler, the less opportunity there is for the development of spoilage organisms. This is a fundamental principle in handling fresh meat and other perishable food products. The underlying principle of quick chilling is rapid circulation of air at proper temperature. After the beef animals, for instance, have been dressed, they are placed in the cooler while at a temperature of about 100°F. The sides hold considerable excess surface moisture, which is given off in a cloud of steam that rises and is condensed in the brine spray.

Proper spacing of the sides, which are suspended on trolleys from an overhead rail, is also important. They should be spaced in the cooler to avoid contact with each other. If there is contact it will cause discoloration and will also prevent free circulation of air about the meat, thus

lessening the opportunity for effective chilling. The temperature of this cooler will run about 35°F., with a humidity of 85 per cent.

Beef sides will shrink on an average of 2½ per cent from the hot weights in the first 48 hours. There will be an additional shrinkage of from one-fourth to one-half per cent in the next 24 hours.

The average person not associated with the meat business thinks of curing in terms of pork products. But considerable beef also is cured, and made more attractive and palatable by such curing as well as, in some cases, by subsequent smoking. Often curing provides a method of holding over beef cuts from a period of low consumer demand to a period of high demand.

Products handled in the beef-curing department may be divided into two general classifications. First, those which may be considered as cuts or primal parts—beef plates, flanks, rumps, rounds, and chucks—which are obtained by breaking up of sides in the beef-cutting department. Second, products sometimes termed variety meats —tongues, cheek meat, head meat, gullet meat, and hearts.

The fundamentals underlying the proper curing of both these classes of products are like those used in similar pork products. Some of the products are dry cured in tight containers, such as barrels, but most of them are pickle cured in vats or tierces.

When pork products are to be dry cured, they are either rubbed with the dry cure mixture, mixed with it in large revolving drums, or sprinkled with it as they are packed in the curing containers. The air is excluded as much as possible when packing the product, and, as a final precaution, sufficient second pickle is poured over the product after packing to displace any air remaining. The curing containers are then heated up, and the contents allowed to cure.

When vat curing is used, the meat products are immersed in a curing pickle in large, open wooden vats, commonly of the hogshead variety. Hogsheads have the advantage of being small enough to be moved to any convenient place. They can also be removed easily from the curing cellar for sterilization by washing and steaming and for exposure to the sunlight, and can be double-decked in order to utilize floor space. The meats are kept submerged in the pickle in these vats by wooden slatted frames which are fastened inside the top of the vat.

Vat curing is preferred by many packers because the operations are constantly visible, giving the supervisory force a better control than when closed containers are used. Also, in overhauling (which in vat curing consists of transferring the contents of one vat to another vat) positive and definite shifting about of the cuts or pieces in cure takes place. This gives all the surfaces of the pieces an equal opportunity to absorb the curing ingredients. Another advantage is that overhauling provides an opportunity for actual inspection of the product during the curing operation.

In tierce curing, the product is packed into the tierces which are "headed up" and then completely filled with the curing solution through a bunghole in the bilge. While tierce curing is not subject to such close control as vat curing, tierces possess the merit of being easily handled. Economy of floor space may also be obtained by piling them on top of one another.

Curing in tierces requires very close supervision. Careful inspection for "leakers" should be made prior to piling. It is good practice to leave the tierces unpiled for at least a day in order to locate any leak which may have developed. Unless the tierces are kept full of pickle at all times, the unsubmerged portions of the meat will not have the opportunity to absorb the curing ingredients and the contents of the tierce will not be uniformly cured.

CIVILIAN CONSUMPTION PER CAPITA OF MEATS AND LARD IN THE U.S., IN POUNDS, 1941–47

Year	All Meats excl. lard	Beef	Veal	Lamb and Mutton	Pork excl. lard	Lard	Meats and lard
1941 [1]	141.9	60.5	7.6	6.8	67.1	14.2	156.1
1942	139.1	61.3	8.0	7.1	62.7	13.6	152.7
1943	138.4	49.6	8.1	6.3	74.4	14.2	152.6
1944	152.7	53.6	12.3	6.7	80.1	14.5	167.2
1945	143.8	58.9	11.8	7.2	65.9	12.3	156.1
1946 [2]	152.8	60.5	9.9	6.7	75.7	12.0	164.8
1947 [3]	157.5	70.0	10.0	6.0	69.0	14.5	172.0

[1] Consumption figures for 1941–45, represent civilian consumption only, obtained by subtracting the lend-lease and other exports and military takings, from the total supply. The per capita civilian consumption was obtained by dividing the total apparent civilian consumption by the total population, adjusted for under-enumeration of children under 5 less 85 per cent of the military forces.

[2] Consumption and per capita figures are preliminary.

[3] Estimated by the American Meat Institute.

Meat production for the principal livestock countries of the world in 1946, exclusive of the Far East, reached 60.5 billion pounds. This is less than the 1945 production by 300 million pounds, and below the prewar (1934–1938) average by about 5.7 billion pounds. The meat output of the principal North and South American countries declined 1.5 billion pounds in 1946, but these countries produced approximately 55 per cent of the world production in 1946; about 58 per cent in 1945; and about 40 per cent in the prewar period (1934–1938). Meat production in Europe, on the other hand, was larger than in 1945, in spite of an emergency food situation, limited feed supplies and other adverse conditions.

European meat output, exclusive of the Soviet Union, in 1946, is estimated at about 5 per cent larger than in 1945, and 60 per cent of prewar. The most significant increases in production occurred in France, Italy, and Denmark, while a decrease took place in Switzerland, where pork production declined. In the Union of South Africa, meat production in 1946 was more than three per cent larger than the preceding year. The Middle East production was estimated at three per cent more than 1945, with the increases occurring in Turkey, Iran, and Iraq. Despite adverse weather conditions, the southern dominions of Australia and New Zealand reflected an increase in meat output for 1946.

Canada's total meat production for 1946, estimated at 2,061 million pounds, is about 12 per cent less than 1945.

The meat-packing industry has come a long way from the simple, crude pioneer methods of operation which were prevalent at its beginning. Little did John Pynchon, in 1640, dream that byproducts from the animals he dressed for this country's first commercial trade would be important factors in producing life-prolonging drugs

and hundreds of new items vitally necessary to our well-being.

As meat packing expanded, resourceful operators began to develop information of great value to the industry on the science underlying its operations, and thus to conserve and improve its products. Later, the American Meat Institute, an organization of about 600 meat-packing companies and sausage manufacturers, established a department of scientific research. The laboratory

MEAT CONSUMPTION PER CAPITA IN EUROPEAN COUNTRIES DURING PREWAR PERIOD[1]

Country	Pounds per capita	Per cent meat calories of total food calories
Denmark	119.0	12.9
Austria	110.2	11.5
France	105.8	8.4
Netherlands	101.4	10.3
Belgium	97.0	10.0
Germany	97.0	9.9
Finland	86.0	8.4
Norway	79.4	7.1
Hungary	75.0	7.8
Czechoslovakia	61.7	8.4
Poland	46.3	6.3
Greece	46.3	3.5
Bulgaria	44.1	4.5
Rumania	37.5	4.1
USSR	37.5	2.7
Yugoslavia	35.3	3.9
Italy	35.3	3.6

of this department, now located at the University of Chicago and staffed by a corps of able scientists, furnishes to members of the institute the scientific results of all successful experiments.

Large quantities of dehydrated meat were prepared during World War II. These products were stored for considerable periods of time and shipped long distances. Information was needed on the composition, vitamin content, and the effect of storage on the vitamin content of the products produced commercially. Through grants-in-aid from the Nutrition Foundation, Inc., cooperative studies were carried out in the institute's laboratories and in the department of biochemistry of the University of Wisconsin. Samples of dehydrated meat produced by many packers were analyzed for protein, fat, moisture, thiamine, riboflavin and niacin. Over a period of one year, these samples revealed practically complete retention of riboflavin and niacin during dehydration and storage, even at storage temperatures of 120°F. Thiamine was stable at 40°F., but at 70°F. there was a large loss at the end of 42 weeks.

Among other studies undertaken by the industry was the effect of time and temperature of processing on the vitamin content of pork luncheon meat. This study was in cooperation with one of the large commercial can manufacturers. Extensive studies were carried out in the plants of several meat packers on the factors influencing the keeping-time and quality of bacon. Quite recently extensive studies have been carried out in the use of corn sugar in curing bacon.

The institute's department of scientific research, established and supported by the meat-packing industry, contributed to the war effort by making available to the Quartermaster Corps and the Veterinary Corps of the Surgeon General's Office, many copies of publications that were used for instructional purposes. Hundreds of copies of *Color Control and Conservation of Sausage* and *Important Considerations in Handling Meats Prior to Canning* were furnished on request of the United States War Department. Harvard University, Texas Agricultural Experiment Station, and Northwestern University have carried on recent meat research supported by the institute. The studies on protein requirements of adults at Harvard University revealed that the protein requirement was about 17 per cent less on a diet in which one-third of the protein was from meat than on an all-vegetable diet. Results of the studies at the Texas Experiment Station indicated the specific amount of the ten indispensable amino acids in various cuts and organs of beef, pork, lamb and veal.

From time to time, government bureaus concerned with the production or conservation of food attempt to persuade the public mind to converge upon the subject of meat versus grain. There follows the usual discussion of the fact that it takes more than a pound of grain to make a pound of meat; the idea frequently being advanced that there should be a sharp shift from livestock production to the use of grains directly as human food, so that more people can be fed.

While it is true that more calories can be realized by using a pound of grain directly as human food than by feeding this grain to livestock, there are many factors which need to be considered, especially from a long-time standpoint. The large stock of data now available on the nutritional value of meat in the diet must be given careful thought and consideration. Meat and other animal products are essential for an adequate diet. It is recognized that meat is (a) one of the richest protein foods, providing protein of the highest biologic value; (b) an excellent source of the important B-vitamins, thiamine, riboflavin and niacin; (c) contains goodly amounts of much-needed fats, rich in the unsaturated fatty acids, considered by many nutritionists to be necessary in human nutrition; (d) provides essential minerals—copper, iron, phosphorus; (e) stimulates the appetite, thus assuring adequate eating of other needed foods; (f) is of high "satiety value"—a meal with meat means a feeling of satisfaction and of well-being; (g) its extractives stimulate the flow of the stomach's digestive juices, thus enhancing digestion.

There cannot be any dispute about the fac that the American people like and want meat and the effect that this strong desire has on morale cannot be overlooked. The American people do not want to be reduced to a diet of field crops.

Another point to consider in the controversy of meat versus grain is the maintenance of soil fertility, for the balanced use of labor and other resources are closely associated with livestock production. A sharp reduction in livestock population and feeding would substantially lower grain yields in the very near future. A sharp liquidation of livestock would provide more feed for other uses in the short run, but would hasten the accumulation of a grain surplus in the United States after the relief period has passed. One most important point which is apparently overlooked by those who favor a reduction in livestock production in favor of greater grain crops for food is that the production of meat and other meat-animal products utilizes large quantities of

grass and roughage which would be largely wasted if not fed to livestock.

One point which proponents of reduced livestock production harp on is that a pound of grain fed to livestock is equivalent to a pound of human food. This definitely is not correct, since grains are not generally consumed in their entirety by humans, but require processing which often results in a large loss in weight, as well as in nutritional value. The byproducts of this operation, of course, go back largely to animal feed.

It also is a fact that some animals used for meat feed exclusively, or almost exclusively, on grain or other forage, and that many others eat only small quantities of grain.

The species of livestock raised in this country principally for meat are cattle, hogs, and sheep.

For ranch livestock the most useful classifications are by sex, and age. Other qualities depend in part on the ancestry of the animals, care during their growth, and the type of feed they have consumed. These latter factors are of importance in determining the price which the producer receives when he sells his livestock, so he governs his action accordingly. Hogs are fed principally on corn, and the majority are shipped directly from the farms where they were bred to central livestock markets, or direct to the packing houses for slaughter.

At the market, livestock are divided into classes based on the sex of the animal. Cattle, for example, are divided into five classes: steer, heifer, cow, bull, and stag. Hogs are classified as sows, barrows, stags, and boars. Sheep are separated as ewes, bucks, and wethers. Sex is not an important classification in lambs and calves. Within these major classes the subclasses of "slaughter," "feeder" and "stocker," are used to indicate the condition of the animal. Animals ready for immediate use, or those where no benefit could accrue from additional feeding, are designated as slaughter.

The older and heavier cattle, which can be improved by fattening, are called feeders. The younger and lighter cattle, which usually are fed for a longer period of time, are known as stockers. These classifications are not precise and the various types shade into one another.

Other differentiations in sorting cattle are based on the use for which the particular meat is destined, and on the age and weight of the animal. Under *use* are included such subclasses as "butcher," which consists of inferior cows, calves, and heifers or "bacon," which includes the hogs whose physical structure makes their sides particularly suitable for bacon. The age classifications include designations such as "yearling" or two-year-old; and weight is termed by lightweight, medium weight, or heavyweight.

Grades which are based on variations in conformation, finish, and quality are of major importance to the packers, for these grades indicate the type of meat which can be secured from the particular animal. Conformation is judged by the shape and build of the animal, the relative proportions of the various parts of the animal. Breeding determines the conformation to a large degree, although feed and care are important. The term finish refers to the quantity, distribution, and quality of the fat on the animal. Fat is important in determining the tenderness and flavor of the meat. Quality is a comprehensive term and is judged by the probable condition of the flesh, fat, connective tissue, color, and juice of the meat. In beef, "marbling" or distribution of fat in the meat is also important in determining quality.

The standards for livestock are, for the most part, the same as the standards for dressed meat. This correspondence is obviously necessary, since the principal value of the animal is derived from the type and quality of the meat which can be secured from it after slaughter.

According to latest official estimates, the meat-yielding livestock on this country's farms, as of Jan. 1, 1947, were: All cattle and calves, 81,050,000 head; beef cattle, 38,469,000 head; hogs, 56,901,000 head, and sheep and lambs, 38,571,000 head. World cattle numbers at the beginning of 1947 were estimated at about 716 million head. This was an increase of 3½ million head over a year earlier. Decreases which were reported in all the North American countries, Australia, and the USSR were more than offset by increases in Asia, Europe, South America, and Africa.

An animal is not all meat. There naturally is shrinkage even under modern methods of preparation. The amount of meat varies from animal to animal or, in butchering terms, its "dressing" varies. In general, however, the yield of meat ranges from 50 to 55 per cent of the live weight of all cattle marketed; from 45 to 50 per cent of all sheep, and from 70 to 75 per cent of all hogs marketed, depending upon weight and finish.

CATTLE: ESTIMATED WORLD NUMBERS, BY CONTINENTS, AVERAGES 1931–1935, AND 1936–1940, ANNUAL 1944–1946

Continent or area	Average 1931–35	Average 1936–40	1944	1945	1946 [a]

Total	695,200	723,800	716,300	714,100	712,400

[a] Preliminary.

As early as 1928 successful production of quick-frozen fruits and vegetables was going on. In fact, the very first experiment with quick-frozen foods was with fish. Haddock, sole, cod, and mackerel fillets were quick-frozen by the Birds Eye process in Gloucester, Mass. The first commercial quick-freezing of meat products was done in Boston in 1929.

Technically, gastronomically, and nutritionally, quick-frozen meats were and are successful. Quick-frozen meats for institutional use have the advantage of predefined cost, uniformity of size for servings; they are boneless, and have all but the minimum of fat trimmed off. The latest available figures on quick-frozen meat production show that in 1941 production reached its peak. One reason why food retailers have not put in large stocks of quick-frozen meats is that dealers must have refrigerated cabinets which will maintain extremely low temperatures to keep these meats from defrosting. Packers maintain temperatures of —20°F. in the coolers holding quick-frozen meats. The average temperature of a refrigerated meat case for fresh meats today is 38°F.

The frozen meat cuts which have been the most popular in the past have been hamburger or chopped steak, rib or loin lamb chops, club steaks, chip steaks, roasts, sausage links, and corned beef hash. A tendency seems to be developing in the retail field to sell cuts which have been prepackaged without freezing.

It largely depends upon the efficiency of the meat packing industry and upon farmers' production and soil conservation practices whether the American people continue to eat well and have the food they like and need for good nutrition.

WESLEY HARDENBERGH,
President, American Meat Institute, Chicago, Illinois.

2. MEAT, Inspection of. Meat, to be fit for human consumption, must have been derived from healthy animals slaughtered under conditions which assure the elimination of diseased meat and freedom from contamination. The edible portions must be separated from the inedible portions in such a way that meat to be used for human food is handled in a sanitary manner. The purpose of meat inspection is to accomplish this, and its procedures and organization are markedly different from other food-control programs. The inspection that will assure a wholesome meat supply must consist of personal supervision by the inspector of each step in the slaughtering and related operations.

The first consideration in an effective meat-inspection program is the construction and equipment of the packing plant. The outside premises, particularly livestock pens, and railroad car-loading and truck-loading areas must be paved, drained, and so arranged as to permit their being cleaned regularly. Adequate space must be provided in the plant for each operation, and care must be taken that all materials used in floors, walls, and ceilings are such that they can be easily cleaned. The water supply must be ample, pure, and distributed throughout the plant under adequate pressure and in sufficient quantities for each operating need. Floor drains should be so located with respect to the various operations as to accommodate those which waste considerable quantities of water. The sewage disposal must be carefully laid out, since large quantities of waste materials result from the slaughtering operation. All equipment used throughout the plant must be constructed so that it can be readily kept clean. It must also be adequate to handle the volume of operations, and its proper location in the plant has a bearing on the maintenance of sanitary conditions. Dressing rooms and toilet facilities for the workmen must be located away from the departments in which the edible product is prepared and handled, and they must be adequate for the number of workers in any given plant.

The health of animals is of primary concern. Each animal prior to slaughter must be examined by an inspector in order to insure that only healthy animals go into the production of meat. The carcass of every animal passed for slaughter must also be given a postmortem examination, to eliminate it, or any part of it, if diseased. The inspectional supervision in the slaughtering department assures the handling of the edible portions of the carcass in such a way as to avoid their contamination by contacting unclean equipment, hides, skin, feet, diseased material, and the contents of sinuses, the digestive tract, the urogenital tract, and the udder. Diseased, unclean, and otherwise unfit meat is condemned by the inspector and destroyed under his supervision, this condemned product being later converted into fertilizer and similar material.

Inspectional supervision over the slaughtering operation assures delivery of clean and wholesome meat to the curing, smoking, sausage, and canning departments. In these departments sanitation and the prevention of adulteration also come under the inspectional control. The equipment used in processing the meat, the method of processing—temperatures employed, fitness of the ingredients added to the meat, and its final packaging—must be supervised to assure distribution to the consumer of a wholesome product, free from adulteration.

In the United States, with its federal, state, and local political divisions, the federal government has jurisdiction over interstate commerce; each state exercises general control within its boundaries; and each local government has its food control responsibility. Federal meat inspection is administered by the Meat Inspection Service of the Bureau of Animal Industry of the United States Department of Agriculture, operating under the Federal Meat Inspection Law enacted in 1906. This law gives the federal agency jurisdiction in packing plants which engage in interstate commerce. The state and local governments take over the responsibility for food control within their respective jurisdictions, including handling, after the federal government's work is done, until the meat is purchased by the consumer.

Historical.—Prior to the development of railroad transportation, meat production and processing, like many other industries, were primarily local enterprises. In fact, the meat industry in Europe and England still consists largely of local, in many cases municipal, slaughtering plants, and the large part of meat preparation is conducted in the local butcher shops. In the United States, with centers of population developing hundreds of miles from the large livestock-producing areas and with the building of great networks of railroads, livestock slaughtering and meat processing have tended to become centralized in the large livestock-producing and meat-consuming areas. This development received added impetus with the advent of refrigerated freight cars. Large meat-packing centers grew up principally in the midwest, and the industry developed with little or no inspectional control. The first national legislation passed in 1890 was intended as an aid to the exportation of food animals and meat from the United States

to European countries. Subsequent enactments in 1891 and 1895 improved the inspectional control, particularly with respect to the handling of condemned meats. The growing meat-packing industry received considerable adverse publicity during the Spanish-American War, augmented later in Upton Sinclair's book entitled *The Jungle* (q.v.) published in 1906. In fact, the subject became a matter of such national concern, that President Theodore Roosevelt gave it his personal attention, which resulted in bringing about the enactment of a comprehensive Meat Inspection Law on June 30, 1906. This act applies to cattle, sheep, swine, and goats, and the meat from these animals.

The Federal Meat Inspection Service.—Under the Federal Meat Inspection Law of June 30, 1906, a comprehensive inspection service was organized, recognizing that for adequate control, inspectional supervision over each step in the slaughtering and processing operation is essential. During 1946, the service employed nearly 3,000 inspectors who were assigned to more than 1,000 meat-packing plants located in 350 towns and villages throughout the United States. A description of the functioning of this service will outline an effective meat-inspection system.

Application for Inspection.—Meat-packing plants which intend to engage in interstate or foreign commerce are required to apply for federal meat inspection. Applicants send in to the meat inspection office at Washington, D.C., properly executed application forms stating their volume of business. These must be accompanied by drawings of the applicant's plant, giving specifications and full information concerning its construction and equipment. If the drawings and specifications meet the necessary requirements to assure cleanly operations and opportunity for efficient inspection, a survey is made of the plant to see whether it conforms with the drawings. If it does, the grant of inspection is issued.

Ante-mortem Inspection.—Animals are placed in properly lighted holding pens where the inspector can move freely among them and study them both at rest and in action. Animals which the inspector does not pass are segregated for further examination, and healthy ones are driven into the plant for slaughter. Animals segregated for further examination are placed in two categories, depending on the findings: Those affected with any condition which would cause their condemnation on post-mortem examination are identified as "U.S. condemned" and are not permitted to be slaughtered as food animals; and the class of animals which present no conclusive evidence of disease but do show symptoms that justify suspecting the presence of some abnormal condition. They are identified as "U.S. suspect," and must be slaughtered separately, afterward undergoing a special post-mortem examination.

Post-mortem Inspection.—The inspection in the slaughtering department is usually referred to as the post-mortem inspection. Actually, the examination of the carcass, its organs and other viscera, which constitutes the post-mortem inspection is only part of the responsibilities of the inspector. He must also regulate the operations in the slaughtering department to eliminate contamination of the meat during each step of the intricate slaughtering operations. The first step in the post-mortem inspection of cattle carcasses is a close examination of each head, consisting of incising the lymph glands, which are studied with all exposed surfaces of the head. Since the head is a common avenue of infection, the finding of a diseased condition there gives indication of what should be looked for in further examination of the carcass. Meanwhile, the carcass has gone on to the dressing bed, where it is eviscerated. The viscera, both thoracic and abdominal, are presented for inspection, using equipment best suited for the particular layout. The larger slaughtering plants have self-sterilizing, moving-top viscera inspection tables. These convey the viscera individually to the inspector so that he can conduct his examination conveniently and in a well-lighted location. This inspection consists of incising the bronchial and mediastinal lymph glands, palpation of the lungs, incision and opening of the heart for observation of the inner and outer surfaces as well as the cut surfaces, incision of the portal lymph glands and bile duct, with observation of both sides of the liver and of the remainder of the abdominal viscera. The carcass passes on from the evisceration position, but before it enters the refrigerator it receives an inspection as it hangs from the rail which consists of a careful observation of all surfaces, and palpating the body lymph glands. If an abnormal condition is found anywhere, the inspector immediately identifies all parts of the carcass with sections of a "gang-tag," each bearing the same serial number reading "U.S. retained." The carcasses and viscera so identified are assembled for what is called a final inspection, more detailed than the earlier routine one. If, on this final inspection, a condition is found affecting the wholesomeness of the meat, it is marked "U.S. condemned" and destroyed for food purposes under an inspector's supervision.

The post-mortem inspection of the carcasses of other species varies only slightly from the outline given for cattle.

Inspection of Meat Processing.—The inspectional supervision of the handling of the passed carcasses and parts, and their manufacture into meat food products begins as soon as they leave the slaughtering department. After being thoroughly chilled, the carcass is removed to another refrigerated room where it is cut into its commercial parts. The products of the carcass-cutting department that go into curing, smoking, sausage making, canning, and so on, require considerable inspectional supervision, in order to assure proper regard for cleanliness and sanitary conditions in preparation up to the time the product is shipped from the plant. Salt and other materials used in curing the meat are examined to make sure that they are clean and free from adulteration. The vat in which the curing solution is prepared must be emptied and cleaned regularly, and the filter through which the solution passes must be in good working condition and cleaned out regularly. The receptacles used for curing the meats must be of such construction as to permit their ready and frequent cleaning, and the inspector must eliminate all other possible sources of contamination by giving strict attention to the ceiling and structures over the curing vats, to make certain that they are dry and free from loose particles, and that all drainage lines are in working condition.

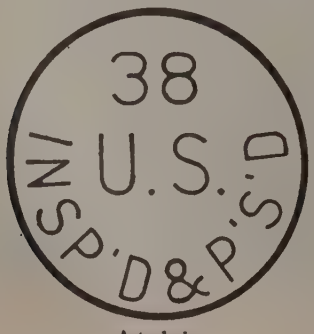
Sausage-preparing operations are both varied and complicated. Modern processing proceeds rapidly, and a considerable volume of the product is handled within a short time. The layout of the

sausage-preparing department and the type and arrangement of the equipment used must permit adequate inspectional supervision. The equipment must be so constructed that it can be easily and thoroughly cleansed, and all trucking and rail areas must allow the manufacturing operations to proceed in an orderly manner and large volumes of the product to be moved without confusion. The casings used for sausage are examined carefully to insure their cleanliness, and must be flushed before their use is permitted.

The canning of meats must be surrounded with safeguards which will assure the proper preparation of the contents and adequate processing of the sealed product. The cans intended for use are cleaned thoroughly, immediately before filling, and are handled mechanically to avoid soiling of the inner surfaces. Each can is flushed in an inverted position with running water at a temperature of at least 180°F. The closure of the can, too, receives careful attention after filling since the subsequent processing is effective only if this is perfect. The inspection prevents delay in completing the processing of the canned product, for otherwise spoilage of the contents might occur between the time the product is placed in the can and when it is heat-processed. Each lot of canned product is identified by tagging the baskets or cages with a tag which will change color on going through the heat-processing; this definitely precludes failure to heat-process after closing. All canned products are required to be plainly and prominently marked on the container in code or otherwise, with the identity of the contents and date of canning.

Sampling for Laboratory Examination.—As an aid to inspectors, seven laboratories are located strategically throughout the country. These laboratories not only analyze ingredients used in the preparation of meat products but also the finished products themselves. The results of the analyses are furnished the inspector for his appropriate action at the plant. In addition to articles of food, the laboratories also analyze cleaning materials, substances used to control vermin, coatings on the surfacing of equipment for meat handling, and many other items that come in contact with meat or are used on premises where meat is handled.

Mark of Inspection.—Each carcass which passes the inspection is identified by marking on it, using a harmless purple fluid, a circular brand bearing the abbreviated inspection legend. Also, each prepared piece of meat capable of being branded is identified with the same mark of inspection. Following is a facsimile of this brand:



Actual size

Each package containing inspected meat, or the label on this package, bears the inspection legend in full. This is always in the same form so that it can be readily identified as the mark of the federal meat inspection, and is in the following form:

Actual size

Labeling.—Before a meat packer operating under federal meat inspection may use a label on his product it must have been approved by the inspection service. When the label is submitted by the packer with his request for approval, it must be accompanied by the formula showing the kinds and amounts of the various ingredients used and also a complete description of the method employed in preparing the product. When the label is reviewed, a decision must be made as to whether the product as planned is the one the purchaser would expect to be identified with this particular label. It must contain certain required labeling information, and it is not permitted to bear any misleading feature. Each label must show the appropriate name of the product, the ingredient statement, the name and address of the manufacturer or distributor, the net weight statement, and the mark of inspection. Any word or design on the label which may be misleading, concerning the origin of the product, its composition, its quality, or its nutritive value would be reason for withholding approval.

Export.—Inspection of meat products for export was one of the first functions, and still remains an important activity of the Federal Meat Inspection Service. Before a shipmaster is permitted to clear a United States port with meat or meat food product for export, he must have, covering the shipment, an export certificate issued by the meat inspection service. This certificate is not only evidence of inspection but also indicates that other special requirements of the country to which the meat is being exported have been complied with. This export certificate has become recognized throughout the world, and wherever meats from the United States go they are accepted on the basis of this identification.

Import.—The Tariff Act, approved June 17, 1930, contains a provision that requires all meat products offered for importation into the United States to be examined and passed by the federal meat-inspection service. Each consignment of import meat must be accompanied by a certificate from the country of origin, and the certificate to be acceptable must be executed in the prescribed form and from a country where the meat-inspection service is considered to be the equivalent of that of the United States. When the importer

declares a consignment of foreign meat, he presents the foreign meat-inspection certificate to the meat-inspection office at the port of entry and requests inspection for his product. If the certificate is in proper form, an inspection is conducted and the product released only if it meets the same requirements which are applied to domestic product. The customs officials will not clear a shipment of imported meat until they are informed by the meat-inspection office at the port of entry that it has passed the inspection.

Horse Meat.—The Federal Meat Inspection Act was amended July 24, 1919, to extend the inspection to horses and horse meat. Under this amendment inspection procedures similar to those applied to other animals are conducted in plants which slaughter horses for the production of human food. Federal horse meat inspection is also limited to those plants which are engaged in interstate or foreign commerce. Prior to World War II, there were only seven inspected horse meat plants. The major part of the production of those plants was exported to Europe as cured horse meat. Toward the close of World War II, the number of inspected plants doubled, due to the increased demand from Europe for horse meat.

Horse meat plants are required to be separate and apart from plants which prepare meat from other species. Furthermore, it is required that horse meat be identified as such, to distinguish it from other kinds of meat. The mark of inspection applied to horse meat is quite different in design, and green marking fluid is used in applying the horse meat stamp which is in the following form:

Actual size

Statistics.—During the twelve month period ending June 30, 1946, ante-mortem and post-mortem examinations under federal inspection were conducted on over 80,000,000 animals and carcasses, of which 34,049 animals were condemned on ante-mortem inspection and 319,091 carcasses were condemned on post-mortem inspection. During that period inspectional supervision covered the preparing and manufacturing operations involving over 13,000,000,000 pounds of meat food products, of which 7,980,799 pounds were condemned on reinspection.

3. MEAT, Market Classes and Grades.[1] Grading of livestock and meats had its beginning when men first started trading in these commodities. In appraising the relative merits of a product the buyer or seller applied some of the principles of grading and standardization as used today. Through the gradual evolution of markets and marketing processes, there developed in men's minds certain concepts of standards for varying degrees of excellence of product which ultimately resulted in recognized classes and grades. With these concepts, a terminology came into use for identifying the standards so that they would have uniformity of meaning.

Because of limited transportation and communication facilities, market areas at first tended to be narrowly localized. Each area developed its own grading system which resulted in considerable variation between areas in the grading systems and in the terminology used. Coincident with the westward expansion and settlement of the United States and the development of its great livestock and meat industry, there came a strong need for more uniformity and accuracy in grading livestock and meats and a terminology that would be uniformly interpreted in all markets so as to facilitate trading. This was especially true after the advent of the railroad refrigerator car, about 1880, which made it possible to ship great quantities of dressed beef from the midwest to the more populated areas along the Atlantic seaboard.

In 1902, the Animal Husbandry Department of the University of Illinois published results of the first study on meat and livestock grading as carried on in commercial trading in this country, and the terminology used in identifying the classes and grades commonly recognized. This study included detailed descriptions of the classes and grades in general use and recommendations for a standard grading system and terminology that would be uniformly understood and accepted throughout the land.

In 1916, the United States Department of Agriculture used the results of the Illinois studies as a guide in formulating the first tentative United States standards for grades of beef. Although these standards were originally designed to provide a basis for a national meat market reporting service, they were put to practical tests in numerous ways by many commercial concerns. Revised on the basis of results of these tests, they were promulgated by the secretary of agriculture on June 3, 1926 as the Official United States Standards for Grades of Carcass Beef and published in *Service and Regulatory Announcements No. 99 (BAE)*. These standards provided the basis for grading when the voluntary beef grading and stamping service was begun in May 1927.

Official standards for grades of veal and calf carcasses were likewise promulgated in 1928, and for lamb and mutton carcasses in 1931. Tentative standards for classes and grades of pork carcasses and cuts also were developed but have not yet been promulgated as official standards.

[1] U.S. Standard for Grade, issued by the United States Department of Agriculture.

The Department of Agriculture now maintains a meat grading service in every major meat processing or meat marketing center in the country. This service is available upon request from any financially interested party. It is operated on a self-supporting basis, the necessary funds being derived from fees collected from individuals and concerns who use it. Grading is done in accordance with class and grade specifications set up in the official standards for meat from the different species of animals. After the grade has been determined by an official grader, a special stamping device is used to apply the appropriate grade name on the exterior surface of the carcass or cut.

BASIS FOR CLASSIFYING AND GRADING

Class.—As used in the federal classification and grading system for meats, class refers to carcasses or wholesale cuts derived from the same species or kind of animal and having a similar commercial use. Carcasses or cuts included in a class will show marked differences in the physical characteristics associated with relative desirability or value, and grade is a measure of the extent to which these physical characteristics vary from those considered to be ideal or nearest perfection.

Grade.—This is an indication of the inherent characteristics that determine the desirability of the product in relation to other meat of the same class. Determination of grade involves an evaluation of the carcass or wholesale cut with two major considerations in mind: (1) the relative proportion of the more desirable to the less desirable parts of the carcass or cut and the ratio of edible meat to bone, and (2) the degree of palatability or satisfaction that is likely to be derived when the meat is consumed. The extent to which a carcass or wholesale cut attains perfection in fulfilling these two considerations is determined from a combined evaluation of three major grade factors—conformation, finish, and quality. Because these factors are inherent in meat they are not subject to change by reason of differences in trade preferences, seasonal conditions or any other unstable or fluctuating factor, and therefore, they provide the basis for a grading system which has proved to be both comprehensive and adequate.

Conformation.—As used in connection with the grading of meat, conformation means the shape, outline or form of the carcass, side, or wholesale cut of meat. Although primarily a function of the development of the muscular and skeletal systems, conformation is also affected by the degree of fatness of the animal at the time of slaughter. Conformation is a direct measure of the first major consideration in determining grade, namely, the relative proportions of the more desirable and less desirable parts and the proportion of the edible to nonedible parts within a cut. Best conformation implies a thick, well-rounded appearance together with a small compact skeletal structure. Poor conformation implies an angular, thin, sunken or irregular appearance, together with a large, rangy skeletal structure.

The best physical guides for evaluating meat on the basis of the second consideration—the relative palatability and general desirability of meat for food purposes—are the finish or degree of fatness in the meat and evidences of quality. These two factors are very closely interrelated and, for purposes of this discussion, no attempt is made to indicate that they have separate influences. The manner in which each is manifested in meat, however, is worthy of mention.

Finish.—This refers to the proportion, character, and distribution of exterior, interior, intermuscular and intramuscular fat in the carcass or cut. Best finish implies a smooth, relatively even covering of fat over the exterior of the carcass. It also involves liberal deposits of fat between the muscles, and between the muscle fiber bundles. These latter deposits are commonly referred to as marbling. Poor finish implies absence of or only slight quantities of fat over the exterior surface of the carcass or cut. Uneven distribution of fat results in bunches and rolls on certain parts of the carcass. A high degree of finish adds much to the attractiveness of the carcass or cut, but its chief significance lies in the fact that, up to a certain point, at least, increases in fatness are associated with increased palatability, and thus the degree of fatness serves as an index to the degree of quality.

Quality.—This is a characteristic of the flesh and of the fat included therein. The physical characteristics denoting quality in meat are rather difficult to describe and define. Quality involves the amount, consistency, and character of the extractives that permeate the muscle fiber and other flesh tissue. It is strongly influenced by the amount and distribution of marbling. Although not a determinant of quality, color serves as an excellent index. Best quality implies full, well developed, firm muscle tissue or flesh with a minimum of strength in fiber and connective tissue and liberal marbling and juiciness other than free moisture. The cut surface shows fine texture and smoothness to the touch and sight. Poor quality is noted by coarse texture, liberal quantities of connective tissue, and little or no marbling. Such flesh usually lacks juiciness but, if abundant, the juice is thin and watery. The meat is stringy, tough, inferior in flavor, and has a low ratio of muscle fibers to connective tissue and bone.

STANDARD CLASSES AND GRADES OF MEAT

The following outline shows the classification and grading schedule used in grading meats from the different species on the basis of the official U.S. Standards.

Beef.—During the process of slaughtering, a beef carcass is separated into two halves by splitting it down the center of the back. This reveals the longisection of the dorsal vertebrae and their attached cartilages from which an estimation of the degree of maturity of the animal can be made. After chilling, the sides are further divided into hindquarters and forequarters. These quarters are frequently subdivided into wholesale cuts. Although varying somewhat in different parts of the country, the most widely used method of making wholesale cuts provides for the following cuts from the forequarters: Chuck, rib, plate, brisket and shank. The cuts usually made from the hindquarters are the loin, round, and flank. Combinations of these cuts have other names, thus the loin and rib combined are referred to as a "set"; the chuck and rib combined are called a "back"; the chuck, plate, brisket, and shank combined are referred to as a "triangle" or "rattle."

Carcasses of bovines are derived from animals of five different sex conditions—steers, heifers, cows, bulls, and stags. Steer carcasses are identified by the typically rough and rather

irregular fat in the region of the cod, the relatively small pelvic cavity and a curved "aitch" bone (pubic symphysis). As a class these carcasses are also rather thickly fleshed, are plump and full, and have the highest average quality of

Species	Class	Grade
Cattle..	Beef (steer, heifer, cow).	Prime, Choice, Good, Commercial, Utility, Cutter, Canner
	Stag	Choice, Good, Commercial, Utility, Cutter, Canner
	Bull	Choice, Good, Commercial, Utility, Cutter, Canner
	Veal	Prime, Choice, Good, Commercial, Utility, Cull
	Calf	Prime, Choice, Good, Commercial, Utility, Cull
Sheep..	Lamb	Prime, Choice, Good, Commercial, Utility, Cull
	Yearling mutton	Prime, Choice, Good, Commercial, Utility, Cull
	Mutton	Prime, Choice, Good, Commercial, Utility, Cull
Swine..	Barrows and Gilts	No. 1, No. 2, No. 3, Cull
	Sows	No. 1, No. 2, No. 3, Cull
	Stags	No. 1, No. 2, No. 3, Cull

any of the kinds of beef. Heifer carcasses are identified by the presence of typically smooth fat in the region of the udder, a slightly larger pelvic cavity, and a straighter aitch bone than is typical of steers. As a group, they tend to be slightly less thickly fleshed and more angular than steers. Cow carcasses are identified by their large pelvic cavity, nearly straight aitch bone, and general angularity throughout. The udder has usually been removed. Hips are usually prominent and the bones are quite hard and white and the cartilages on the end of the dorsal vertebrae are frequently entirely ossified. Bull carcasses are identified by extremely bulging rounds, heavy crested necks and thick shoulders. The flesh is quite dark and coarse. Stags usually have characteristics which are intermediate between those of bulls and those of steers.

All beef from steers, heifers, cows, and stags, except the very leanest, is ordinarily sold as fresh or "block" beef. Bull beef is generally used in the making of certain types of sausage and other manufactured meat products.

The original federal standards for grades of beef provided for the grading of each of the five class groups according to separate standards. In 1939, the standards were amended to provide only one standard for the grading of beef from steers, heifers, and cows. Inasmuch as the beef from these three groups comprises practically all the beef sold as retail cuts to consumers, this change greatly facilitates the purchase of meat by grade at the consumer level.

The federal standards for grades of beef (steers, heifers, and cows) consist of seven grades. They are prime, choice, good, commercial, utility, cutter, and canner.

The prime and choice grades of beef include carcasses which are compact, thickly fleshed, and which have very liberal quantities of fat over the exterior surface and between and within the muscles. Because these grades include only carcasses produced from young animals, the meat is also fine in texture and bright in color.

Carcasses grading utility, cutter or canner are much more angular, rangy, and thinly fleshed than those in the prime and choice grades, and have little or no fat over the outside or between or within the muscles. Utility, cutter or canner grade carcasses are largely from animals advanced in age, and the meat is also usually dark in color and coarse in texture. Carcasses grading good and commercial are usually intermediate in conformation and, particularly in the commercial grade, there may be a great deal of variation with respect to the maturity attained by the animals prior to slaughter. Because maturity and fatness are considered compensatory in their effects on quality, there is likewise a considerable variation in fatness among carcasses of these grades. Beef carcasses having characteristics indicating that they were produced from relatively young animals will qualify for the good or commercial grades with considerably less finish or fatness than carcasses from more mature animals.

The federal standards for grades of bull and stag beef include six grades. They are choice, good, commercial, utility, cutter, and canner. Standards for grades of these two classes are formulated on much the same basis as those for steers, heifers, and cows.

Veal and Calf.—Meat from bovine animals which are younger than those which produce beef is termed veal or calf. The distinguishing characteristics between veal and calf are the color and character of the flesh and fat.

Veal is produced from very young bovine animals which have subsisted almost wholly on milk up to the time of slaughter. The flesh is very light colored, and the fat is rather waxy and pinkish white in color. It is common practice to leave the skins on veal carcasses until offered for sale. This is done to preserve the light color and to prevent undue evaporation of moisture from the carcasses. Usually, the carcasses are not split down the back at the time of slaughter, although they are frequently divided into halves, quarters or even wholesale cuts prior to sale.

Calf is produced from immature bovine animals which are usually somewhat older and larger than those that produce veal. These animals are usually from 5 to 8 months old at the time of slaughter and their carcasses weigh from 200 to 300 pounds. Calf carcasses may be dressed like veal, with the skin left on and not split down the back, or they may be dressed like beef with the skin removed and the carcass split into two sides. Calf is sold as sides, quarters, or wholesale cuts.

Because both veal and calf carcasses are derived from very young animals, sex condition has not developed sufficiently to affect the physical characteristics of the carcass. In the normal marketing of these classes, therefore, little or no importance is attached to this factor. The standards consist of six grades of calf and veal, namely: prime, choice, good, commercial, utility and cull. Grading is done according to standards that are formulated on much the same basis outlined for beef. In comparison with beef, however, calf and veal have considerably smaller quantities of fat over the outside of the carcass and practically no marbling within the muscles even in the higher grades. Conformation required for each of the grades of calf and veal is comparable to that required for beef of corresponding grades.

Lamb and Mutton.—In the marketing of carcasses and wholesale cuts of ovines (sheep), the class determination is based largely on de-

gree of maturity or age of the animal at time of slaughter. Because age markedly affects meat flavor, carcasses of sheep and lambs are divided into three classes—lamb, yearling mutton, and mutton. The proportion of the total supply sold as lamb far exceeds that included in the other two classes.

Lamb carcasses are produced from animals of less than about 12 months of age. They are distinguished from yearling mutton and mutton carcasses by their general conformation, which usually is more compact and blocky, by their smaller, redder bones, especially the ribs and shanks, and by the presence of a so-called "break joint" on their front shanks. The color of their flesh tends to be of a lighter red color than that of the other age groups.

In market channels, lambs as a class are further divided into three more or less specific groups. These are hothouse lambs, spring lambs, and fed lambs. Most hothouse lambs are born in the late winter and, as a result of very special care and management, are made ready for market before or by the Easter season. The supply of these lambs is very small and the demand for them is limited largely to a very restricted outlet in a few large cities, mostly in the East. Hothouse lambs are usually dressed by leaving the head, pelt, and pluck (heart, lungs, diaphragm, and liver) attached to the carcass.

A spring lamb is one that is born in the winter or early spring and marketed at an age of about 5 to 7 months. Most of these lambs are produced in the general farming sections and in California and Arizona where winter shelter and excellent early spring grazing are usually available.

Fed lambs are lambs which have been fattened on grain or other concentrates before being marketed for slaughter. Most of them are born in the spring in the range country of the Rocky Mountain and Western states where pastures are generally insufficient to fatten lambs to a satisfactory slaughtering condition. These lambs are shipped off the range in the fall and are sent to feed lots where they are fed for a period of two to four months before being sold for slaughter.

Yearling mutton carcasses are from animals of about 12 to 24 months of age. They are distinguished from lambs by their rather long, angular conformation, their somewhat dark flesh, and their whiter, flatter ribs and longer, whiter shanks. They may or may not show a break joint.

Mutton carcasses are identified by their white hard rib bones and shanks, dark flesh and the absence of the break joint on the front shank. Instead of the break joint such carcasses have a so-called "round" or "spool" joint. This is the functional pastern joint at which the foot must be removed after the ossification of the break joint.

Official United States standards for grades of lamb carcasses, yearling mutton and mutton carcasses include six grades. They are prime, choice, good, commercial, utility and cull. Carcasses and wholesale cuts of the higher grades are very compact, thickly fleshed, and full in all parts. They are required to have rather extensive fat covering. Carcasses in the lower grades are angular and irregular in their conformation, have little, if any, fat covering and their flesh is usually quite dark. Within each age group, carcasses that show evidence of being from comparatively young animals will grade slightly higher than carcasses from older animals of equal finish.

In the wholesale meat trade, mutton carcasses are sold in the form of wholesale cuts to a much greater extent than lamb carcasses.

FRED J. BEARD,
Chief, Standardization and Grading Division, Livestock Branch, United States Department of Agriculture.

4. MEAT PACKING. The American packing industry is the outgrowth of three unique factors: (1) enormous grazing and agricultural areas available for raising and feeding meat animals; (2) the remoteness of these areas from main areas of consumption; and (3) a large urban population of industrial workers who require substantial quantities of meat.

It is a tribute to the vision of the pioneers of the contemporary American meat industry, men like G. F. Swift, P. D. Armour, and George H. Hammond that, as early as the 1870's, they realized the possibilities of large centralized slaughtering and meat storage operations in the great rail centers of the country. Their courageous formula of operation, which has had much to do with the development and the present world preeminence of the American livestock industry, was to buy for spot cash, at any time, all the livestock the grower chose to offer. The packer assumed the risks of finding a market for this meat, and of storing the surpluses produced in the months of heavy livestock runs for distribution during the months of lighter supply. This policy, requiring at certain seasons enormous amounts of bank credit, has made American livestock as instantly convertible into cash as a government bond.

Meat packing is a fast-moving, exciting and often baffling business—a middleman operation depending upon 4,500,000 American livestock farmers and ranchers for its raw material. It sells its product to about 350,000 retail meat outlets and restaurants which in turn supply the daily needs of 145,000,000 consumers. Due to changing crop and livestock supply conditions and to changes in consumer purchasing power the industry's pattern and tempo of operation are never quite the same from year to year. In the modern phase of its development from the 1870's through the first two generations it was probably more of a family business than any other great contemporary industry in the United States. The many quick and far-reaching decisions as to the daily purchase of livestock and the sale of product were best handled by owner managers. Each business in its earlier stages required hard and long application and an *esprit de corps* best furnished by members of a family. With the advent of the third generation, family control and management is no longer quite so general.

Functions of American Meat-Packing Industry.—The basic functions of the American meat-packing industry can be summarized:

(1) It takes all livestock offered by growers at any time for cash.

(2) Slaughters and subdivides carcasses into cuts required by retailers and consumers.

(3) Prolongs usability of meat through refrigeration, curing, smoking, cooking, and canning.

(4) Stores a portion of the meat produced (mainly pork) in freezers to carry it from the winter period of surplus production to the season of underproduction in the summer and early fall.

(5) Processes part of the meat into palatable

consumer products such as hams, bacon, sausage, canned meats, and lard.

(6) Distributes meat products under refrigeration to 300,000 retailers throughout the United States and in foreign countries.

(7) Saves all byproducts for transformation into such important products as leather, soap, glue, animal feeds, fertilizers, and pharmaceuticals such as insulin, liver extract, adrenalin, pituitrin, thyroid extract, and many others.

Historical Development.—There were no domestic meat animals on the American continent when Europeans first discovered it. Cattle, hogs, and sheep were imported from Europe by the early explorers and settlers. Hogs were generally permitted to roam wild (as they still do in some parts of the United States) and were rounded up and even hunted with muskets when needed for food.

The first evidence of an organized meat-packing industry in what is now the United States appears in the taking over of some of the British trade in salt pork with the West Indies by New England farmers during Cromwell's revolt and rule in England—less than 50 years after the landing of the Pilgrims at Plymouth. The first person known to have entered the business commercially was a Captain John Pynchon of Massachusetts, who between 1662 and 1683 slaughtered and barreled large numbers of hogs. Beef was also packed in the early days, as was venison and even bear meat. This was the beginning of the American meat-packing industry, so named because in its early stages it occupied itself chiefly with salting and packing its products into barrels —the only method then known by which meat could be preserved and transported.

About the year 1795 there came a new spur to livestock production in the United States. "Mad Anthony" Wayne had finally routed the Indians near where Toledo stands, thus opening Ohio and the Ohio Valley to safer settlement and farming. The collapse of the Whisky Rebellion in western Pennsylvania tempted corn farmers there to put more of their corn into hogs instead of hogsheads. Settlers moving into the fertile lands beyond the Alleghenies raised livestock in rapidly increasing numbers. By 1830, Cincinnati, centrally located in this region, had developed into the country's first packing center. It was even known as "Porkopolis" and shipped its barreled pork by water and later, by rail all over the country and in export. But fresh meat, one of the most perishable of commodities, could be transported to eastern cities, to supplement the local supplies, at that stage only by driving the animals hundreds of miles, or later, by rail shipment to the points of consumption. No one had as yet thought of the refrigerator car.

In those early days, meat packing was almost solely a winter operation, because frost was needed to chill the carcasses and keep them from spoiling. American ingenuity, however, soon introduced ice for refrigeration. Early packing house coolers were so constructed that enough ice could be stored in great decks above the coolers to last until the next ice crop was available.

Cincinnati reached its zenith as a packing center in the 1850's. Thereafter, the center gradually shifted to a younger city at the head of Lake Michigan, Chicago, which was rapidly becoming the metropolis of an agricultural valley of unrivaled fertility. The Civil War, with its large requirements of meat supplies for the Northern armies, was a great spur to livestock production in the upper Mississippi Basin. In the decade of the 1860's, Chicago became the country's and the world's greatest meat-producing center—a position it retains today.

The reasons for Chicago's pre-eminence were not far to seek. Location had made it a great natural railway center whose radiating lines could bring in vast quantities of livestock, and readily distribute meat products. Situated on the easterly side of the country's principal livestock-producing section, it was in the direct line of movement to the east. The concentration of the packing industry in Chicago, and later in other rail centers farther west came in an era when railways furnished the only reliable means of year-round transportation.

With the development of the motor truck and paved roads after World War I, together with cheap long-distance telephone service and radio to spread market information and facilitate trading, a process of decentralization occurred in the industry. Three hundred thousand miles of paved highways now permit farmers to market their livestock at centers nearer their farms and in smaller lots than was feasible when carload lots had to be assembled for shipment to distant markets. As a result, packing houses have followed the livestock into the country, as witness the development of interior plants throughout the corn belt. More recently, numerous packing houses have been constructed in the south, a region which in the second quarter of this century witnessed a great increase of livestock raising. This again stimulated the early method of buying livestock directly from the producer, as contrasted with the buying through commission houses at the great central markets, characteristic of the industry's "railway age." The movement toward decentralization is now reaching a state of balance with the central market buying. Historically, the packing industry has moved as close to its livestock as prevailing conditions have permitted in order to diminish the large freight costs and losses incident to moving live animals.

Livestock Buying.—The meat-packing industry buys its livestock in five ways: (1) At the public stockyards in the large central markets; (2) by direct purchase from the farmer at the packing house or at the packer's country buying station; (3) from dealers located at country points to whom farmers have sold their livestock; (4) in auction rings run either by individuals or farmers' associations; (5) by sending their buyers to farms and ranches to buy livestock there from the producers.

The great central markets located in the country's larger cities are also known as terminal markets or public stockyards. Official United States Department of Agriculture data on livestock receipts are based on the activities of about 70 of these terminal markets. The Chicago market receives the greatest number of cattle, with Kansas City, Omaha, Sioux City, and East St. Louis next, in the order given. Chicago also receives the greatest number of hogs, with East St. Louis, South St. Paul, Indianapolis, and Omaha runners-up, in that order. The largest calf receipts are at East St. Louis, with Fort Worth, South St. Paul, Milwaukee, and Jersey City next. The greatest number of sheep are received at Denver livestock yards, with Fort Worth, Kansas City, and Chicago next, in that order.

Central Markets.—Livestock sent to terminal markets is generally consigned to commission firms who represent the seller and who operate under the supervision of the Federal Packers and Stock Yards Act. Yardage, weighing, and commission charges are deducted from returns made to the seller. Anyone may purchase livestock on these open terminal markets. The principal purchasers are packer-buyers, who buy for their local packing house or for reshipment to company packing houses in other cities, and order-buyers who represent packers located in other cities. In some instances, such packers may have their own buyers on the market. Each buyer purchases what he pleases.

Direct Buying.—Under the direct selling method, the packer holds himself in readiness to purchase at his packing plant or outlying buying stations whatever livestock the farmer chooses to bring in. The farmer pays no yardage commission nor weighing charges under this method of selling.

Dealers.—Dealers owning livestock may sell it to the packer under any of the methods mentioned above, but generally they deliver it to the packing house or to the packer's country buying station. Packer-buying stations have greatly increased in recent decades due to increasing competition for livestock.

Auction Markets.—Livestock auction markets have also increased in number during recent years. Latest available figures (1948) indicate that there are about 1,200 of these markets of which 900 are located in the corn belt.

PACKING HOUSE OPERATIONS

Because of the perishability of meat, modern packing houses consist largely of refrigerated and air-conditioned rooms. All packing house products, with the exception of canned meats, must be held constantly under some degree of refrigeration, ranging from 10° to 20°F. below zero up to around 50°F. above zero. This entails expensive construction including heavy costs for insulation and refrigeration.

Slaughtering Operations.—General meat packers handle all four species of livestock—cattle, hogs, calves, and sheep, though many smaller concerns handle only one or two species. Hogs and cattle require separate dressing lines; calves and sheep are often dressed on the same dressing line, but at different times. All livestock is killed by severing the blood vessels of the neck, generally while the animal is hanging head down. Cattle are first stunned so as to permit their being handled. Since bleeding is very rapid, the animal loses consciousness rapidly, probably in a few seconds.

All species are eviscerated on the dressing floor. Cattle are split down the middle of the backbone into sides; calves and lambs are not split. The hides of cattle and the pelts of sheep are removed. The calf skins are not removed until after the animal is thoroughly chilled and often not until it is in the retailers' hands. Hogs are not skinned; instead, they travel through a long scalding tub in which water at 140°F. loosens the bristles from the skin. They are then run through mechanical dehairing machines where steel scraping blades attached to flexible revolving belts remove practically all the hair from the carcass. The hog is then hung by its hind legs on a spreader trolley which is placed on the rail on which it is moved slowly forward by an activated chain. This moving chain was probably the first application of the principle of line production (that is, moving the product past the operator) in the United States and perhaps in the world (Henry Ford states in his autobiography that he got the idea of his assembly line for manufacturing automobiles by inspecting the "disassembly" lines of the meat packers).

Removal of fine hairs still remaining on the hog carcass is accomplished either through shaving with knives or through immersing hog carcasses momentarily in melted rosin. The coating of rosin, which cools promptly, when stripped from the carcass carries with it all the remaining hair. The rosin is reheated, strained, and used again and again. Hog-dressing lines can be run at varying speeds, but 600 hogs per hour is the highest speed permitted by the Meat Inspection Division of the United States Department of Agriculture.

All hog-dressing operations are performed as the hogs move head down past the workers. After evisceration and removal of the head, the carcasses are split down the backbone. A wide-bladed cleaver is used after its path has been marked with a portable circular saw. The split must be exactly in the middle in order to leave an equal amount of backbone on each pork loin. Thereupon follows removal of the leaf lard from the carcass. This rich fat overlying the kidney is used in larger plants for manufacture of neutral lard, an ingredient found in some oleomargarines.

After dressing operations are completed, all species of livestock are immediately run on rails into chill rooms in which the air is sharply refrigerated either by sprays of chilled brine or by unit coolers through which the air is drawn by mechanical blowers. The more rapidly the carcasses are chilled (without freezing them) the less the later spoilage and the better the bloom (bright pink color) of the meat. In modern chilling rooms all species of livestock except heavy cattle can be sufficiently chilled (to an internal temperature of 34° to 38°F.) within 18 to 24 hours to permit shipping or cutting.

Cutting Operations.—All except the lower qualities of calves, sheep, and lambs are sold in fresh condition. Most of them go to the retail trade in carcass form, but many packers are willing to break these carcasses, that is, cut them into their primary parts so that the retailer may buy only the parts he needs for his trade. These "primal parts" for veal and lamb are the legs, the loin, and the rack or forequarter.

Beef carcasses, after chilling, are rolled on high rails into sales coolers where they are graded and marked by packers or government graders. In abattoirs located in cities many buyers come to the meat-packing plants and purchase their beef "on the rail" but most beef is quartered by cutting each side in two, and shipped to packer branch houses for sale, or shipped to the packer's customers according to numbered specifications printed in packers' price lists. Much beef is broken into primal cuts by the packer for the convenience of retailers. These main cuts are the round, loin, rib, chuck, and brisket.

For grades of market beef, veal, pork products, mutton, and lamb, see MEAT, MARKET CLASSES AND GRADES.

Curing.—Just as primitive man discovered that his meat would keep longer in chilly weather he probably discovered that prolonged soaking in salt water had a preservative effect. Chilling and

salt-curing are still the most extensively used methods for maintaining or improving the keeping qualities of meat.

Probably 95 per cent of all meat cured by the packing industry consists of pork cuts including hams, bellies, picnics, pork shoulder butts, and certain fat cuts. The other 5 per cent consists of certain beef cuts which are salted and made into dried beef.

There are three methods of curing—dry salting, dry curing, and pickle curing.

The rougher, heavier bellies, fat backs, and plates are subjected to dry salting, which involves their being packed in salt and piled in the curing cellar to a height of about three feet; the salt gradually penetrates and preserves the meat.

In the dry-curing process (a very accurate and delicate cure used primarily on better grades of bacon) fixed quantities of curing ingredients are sprinkled over the bacon bellies as they are packed tightly into a covered metal box and left to cure in their own juices for about three weeks.

In sweet pickle curing, which is used primarily for hams and picnics, a new method of cure was introduced during the 1940's. These joints are now injected with a brine curing solution through a tube clamped to the proper artery. The brine is forced under pressure into the capillaries where it instantly reaches every minute part of the cut, thus greatly expediting the cure. After the joints have been "pumped," they are placed in mild brine for not less than ten days to allow the curing ingredients to take effect and impart a cured flavor. Hams and picnics which under former methods were kept in cure for from 20 to 80 days (depending upon size), can now be turned out in 10 to 15 days and with milder salt flavor than before.

Smoking.—This interesting preservative process undoubtedly originated when primitive man attempted to preserve his meat by drying it over a slow fire. He soon found that only cured meat could be handled in this way without spoiling, and, also, that the smoke of hard wood not only helped preserve the meat but imparted a warm brown color and a delicious flavor. Today this process still is used to give hams, bacons, and many sausage products their final attractive color and tang. Smokehouses of varying sizes are used, some holding as much as 50,000 pounds of meat, with heat, humidity, and smoke conditions accurately controlled.

Sausage.—There can be little doubt that sausage was a familiar product in the early civilization of man. It is mentioned by the Chinese and the Chaldeans many centuries before the Christian era. From the time of the Greeks, sausage has been a staple food. Its development is due largely to the fact that salting, spicing, and stuffing meat particles into a protective casing was found to be another admirable way to preserve meat; but spicing also permitted the creation of many fine blends of flavor. Many nationalities have contributed to this important development. The Italian people, on account of their warm climate, originated many of the so-called "summer sausages" which, made and dried in cooler seasons, could be kept into the summer. The Germans had much to do with the development of the so-called fresh or domestic sausages such as frankfurters, pork sausage, liver sausage, ham sausage, and headcheese.

Sausage is such an important product of the meat-packing industry that its manufacture constitutes a large-scale business in itself, requiring exact technical knowledge and expert handling. Sausage making is really a branch of the culinary art and has in many plants reached a high degree of excellence. High-speed grinders, choppers, and mixers are required to comminute and blend the various meats and spices. This meat batter is then placed into vertical cylindrical stuffers and put under pressure of a pneumatically activated piston. When nozzles over which the casing has been pulled are opened the meat flows into the casing.

Different sausages undergo varying treatment after that. Some, like pork sausage, are promptly packed and sold fresh. Many others are smoked for a number of hours, and then cooked in hot water showers to complete the heating process. The so-called dry or semidry sausages are smoked for periods ranging up to several days and are then hung in air-conditioned rooms for drying, some varieties for several days, others for many weeks.

The popularity of sausage is indicated by the fact that in 1947 approximately 1,600,000,000 pounds were produced in the United States under federal inspection. This was probably only one half of the total, since an equal quantity was produced for sale within the states under state and local inspection laws. Sausage manufacture enables the meat packer to utilize wholesome material which would otherwise have to be marketed in a form less pleasing to the appetite, thus adding to the variety of nutritious meat protein foods which can be placed on our tables. Most of the time, the sale prices of sausage products are below those of the principal cuts of meat, such as steaks, chops, and roasts.

Canning.—The final method of preserving meat is through canning, a process not perfected until the 19th century. Various types of meat and sausage are hermetically sealed in cans under some vacuum, often at the rate of 150 cans per minute. The cans which drop into metal baskets are then locked into steam chests called retorts, where the contents are sterilized at temperatures ranging from 220° to 250°F. After cooling with water in the retorts the cans are dried, labeled, and boxed. Since canned meat is sterilized it requires no refrigeration and will keep for indefinite periods. Among the most popular canned meats produced by the meat-packing industry are luncheon meat, chopped ham, corned beef hash, chili con carne, frankfurters, and pork sausage.

Marketing and Distribution.—States west of the Mississippi produce about three quarters of the nation's meat but consume only about one third. Consequently, meat and meat products move eastward and westward from the corn belt in large quantities. More product is now shipped to the west coast than before World War II, because of the rapidly increasing population in that region.

Meat packers sell their products out of the packing house or out of their branch houses in three different ways: through house salesmen, foot salesmen, and peddlers. Large buyers, such as chain stores, other packers, jobbers, and sausage manufacturers are generally handled by the first method. Foot salesmen bring or send in orders from the larger independent meat markets and restaurants. Peddlers who carry bulk stocks of manufactured goods like sausage, smoked meats, and boiled hams in refrigerated trucks serve the smaller buyers, such as small meat markets and

delicatessen stores, whose orders are too small to be put up and delivered separately.

Delivery is made by meat packers either from the packing house or from branch houses, of which the larger packers have over a thousand located in most cities of 20,000 and over. Packers use either their own or hired refrigerated motor trucks for deliveries within trucking range. For points beyond, refrigerator cars are used to serve the car-route salesmen and branch houses. The territories of several salesmen are often served, as the car is partially unloaded at various points before reaching its final stop. Merchandise is promptly delivered to retailers by local draymen.

Intense competition prevails in selling meat products. As many as 15 packer salesmen may call on a metropolitan retailer each week—perhaps somewhat fewer in smaller cities and towns. The industry extends credit to its customers for an average period of two weeks, which, in periods of high prices, may aggregate $250,000,000 for the entire industry.

Economics of the Industry.—Any attempt to depict the American meat-packing industry should include a discussion of its economics. Few other industries have quite the same set of economic conditions to deal with. The supply of livestock available to the industry varies from year to year with the amount of feedstuffs farmers have on hand, for beef and pork are merely corn and forage promoted to a higher level through the chemical laboratory of the meat animal. Large corn crops unfailingly encourage livestock raising; small crops curtail it. Except as feed for livestock, 85 per cent of American corn has no value, and little of it leaves the county in which it was grown until it has been converted into livestock, poultry, or dairy products. While a shortage of feed may not immediately decrease livestock numbers, it has a prompt effect on the weight of the animals, with much the same effect on the meat supply.

The first point of economic interest is, then, that the meat-packing industry has no control over its supply of raw material. Here it contrasts with the numerous industries which acquire their raw material in accordance with their ability to sell their products. The packer cannot regulate or even predict the flow of livestock to market because each of the 4,500,000 livestock farmers in the country markets his stock when he pleases, and because livestock in contrast with all other crops (except poultry) may be marketed in any stage of maturity.

In the next place, because livestock and meat are highly perishable, all livestock coming to market must be promptly bought and dressed by the packing industry. From 75 to 80 per cent of the meat produced must be sold, distributed, and eaten within a week or ten days. Meat and livestock must therefore be defined as perishables in uncontrolled supply which economists (and meat packers) say must be sold for what they will bring. Uncontrollability is really the important factor. Bread is a perishable, but it is stable in price because it is produced only as needed. It is in controlled supply. Perishables in controlled supply are in an economic sense not perishable at all, but partake of the economics of nonperishables. But meat is like fresh fruits and vegetables in that its price level must be such that the available supply moves into consumption before spoilage sets in.

The next point of economic interest is that lean meat enjoys a highly elastic quantitative demand. Here again it contrasts with bread, which people buy in rather stable quantities irrespective of its price. The appetite of the American people for lean meat has apparently never been satiated. Packers know that people will eat as much meat as they can afford, and that, if the price were too low, stocks would be promptly depleted and many people who wanted meat would have to do without it. A relatively slight reduction in meat prices has a promptly stimulating effect upon demand; conversely, price advances progressively reduce consumption. In other words, the American housewife buys meat, not so much by the pound as according to the money in her purse.

The relationship between the national buying power and meat prices has recently been the subject of much research. It is an interesting fact that in recent years the retail value of meats and lard has ranged between 6 and 6½ per cent of the national disposable income.

Cost Finding.—Most industries assemble their products and arrive at their final costs by adding up the components entering into the finished article. The meat-packing industry starts with live animals of known cost and then proceeds to disassemble them into many cuts and byproducts, all jointly and inseparably produced. This gives rise to a special byproduct or group cost problem. Packers have found no formula under which a true cost can be placed upon individual pork products because of the fluctuating values of the many other products to which they are related. Moreover, in the fresh-meat trade, market value takes precedence over costs which are useful primarily as a guide to future buying operations.

Industry Statistics.—The packing industry involved in 1947 a capital investment of about $940,000,000. On the basis of the latest census figures, it employed 250,000 people with an annual payroll of $887,000,000. For many decades the dollar sales per year were the highest of all American industry. In latter years, due to the upswing in steel and automobiles, it has vied with them for top position. Production for all branches of the meat industry (not including country butchers and farm slaughter) in 1947 amounted to about 21.2 billion pounds of meat and 2 billion pounds of lard, an average of 58 million pounds of meat per day. This meat was produced by more than 4,000 packing companies ranging from a number of very large concerns doing business on a national scale down to small establishments employing only a few men and doing only a local business.

The meat-packing industry is extremely competitive, as is evidenced by the fact that its profits over many decades have ranged from one to one and one-half cents per dollar of sales. This profit, amounting to only a fraction of a cent per pound of meat sold, is an imperceptible factor in the price paid for meat by consumers. The packing industry, moreover, returns a greater percentage of the consumer's meat dollar to producers of its raw material than most other agricultural processing industries. In July 1948, this return to producers was 73 per cent, whereas poultry and eggs returned 71 per cent, dairying 61 per cent, all fruits and vegetables 36 per cent, and bakery and other cereal products 29 per cent.

OSCAR G. MAYER,
President, Oscar Mayer & Co., Chicago.

MEATH, mēth, Eire, county in the province of Leinster, with an area of 577,824 acres. It is bounded by the counties of Louth, Monaghan, Cavan, Westmeath, Offaly, Kildare, and Dublin and by the Irish Sea. The county town is Trim, and the main rivers are the Blackwater and the Boyne. The Royal Canal passes near the southern border. Most of the land is very fertile, being favorable for the principal crops which are potatoes, turnips, and oats. The chief occupations, in addition to farming, are textile-making and stock raising. There is no good harbor despite the seacoast, although the rivers provide both trout and salmon. Meath was made a county during the time of Edward I, but its boundaries were not fixed until much later. Two of the noted landmarks are the ancient round towers at Kells and Donaghmore. The royal palace at Tara, the monasteries of Duneek and Clonard, and the fort at Trim are other distinguished relics of the section's long history. Pop. (1943) 65,298. Consult Healy, John, *History of the Diocese of Meath* (Dublin 1908).

MEAUX, mō, France, a town in the department of Seine et Marne, located 28 miles northeast of Paris, on the right bank of the Marne River. It is famous for its beautiful setting and many notable church buildings and castles. Meaux has been the seat of a bishopric since 375 A.D. The Cathedral of St. Etienne, built from the 12th to the 16th centuries, contains the tomb of Jacques Bossuet (q.v.), bishop of Meaux and a renowned orator. The ancient episcopal palace dates from the 13th to the 16th centuries. The town has been in existence since Roman days when it was the capital of the Gallic tribe of Meldi. It was besieged in the 15th century by Henry V of England and became the first Protestant town in France. During World War I it suffered from the German drive toward Paris, although the enemy was stopped here and turned back to the Aisne. Again in World War II it became the scene of fighting and was occupied by Germany until the liberation of France in 1944. Pop. (1946) 13,030.

MEBANE, North Carolina, a village located in both Alamance and Orange counties, altitude 678 feet, situated 23 miles northwest of Durham, and served by the Southern Railway. Founded in 1854 by Frank Mebane, it became an industrial and tobacco market town and the trade center for a large farm area. In addition to having the oldest furniture factory in North Carolina, its other manufactured goods include mattresses, bedsprings, and cotton yarns. The annual Six-County Fair is held each fall at Mebane. Pop. (1940) 2,060; (1950) 2,068.

MECCA, měk'ä (Arab. *Makkah*), Saudi Arabia, the holiest city of Islam, capital of the territory of Hejaz, located about 45 miles east of its Red Sea port Jidda with which it is connected by road. The Mohammedans called the city Umm-al-kora, meaning "Mother of Cities," deriving its sanctity from having been the birthplace of Mohammed. Mecca is situated in a narrow, sandy valley, enclosed by barren hills from 200 to 500 feet high. Jabal Khandama, with a height of about 3,000 feet, is located nearby. After heavy rains the water flows down from the hills into the city, often filling the streets with water.

Ancient walls barred the valley at only three points where gates led into the city. Its early importance came about because caravans crossing the desert used Mecca as a stopping place on the well-traveled incense routes. In addition, even before the time of Mohammed, it was also a holy shrine of pilgrimages, where religious festivals were held at various places in and around the city. After the people of Medina refused to recognize Mohammed as the new Prophet, he made his followers turn toward Mecca as the holy place instead of Jerusalem. In every mosque, the house of worship for Mohammedans, there is a niche in the direction in which Mecca lies, toward which the faithful look as they engage in their daily prayers.

The great mosque of Mecca, with its courtyard and colonnades, occupies a central square which divides the city into the northern upper and the southern lower towns. Lively bazaars almost surround the mosque and also occupy the smaller streets. Between pilgrimages, the university hall in the mosque is used for lectures on law and science. Streets are wide and unpaved, and the stone houses are often three stories high. The city is large enough for more than three times its normal population in order to provide room for the pilgrims, as apartments in almost every house are rented to strangers. During three or four months of the year Mecca is the greatest market in the East. Since idolatrous ages, visitors have been the source of wealth for local inhabitants, who are largely settlers or children of settlers, attracted by the opportunities for prosperity. The sherifs of Mecca, who are the descendants of Mohammed, became a numerous and wide-spread group. They wear the same costume, priding themselves on the green robe which is the identification of their heritage.

The colleges of Mecca have fallen into decay, and vast libraries which once existed have disappeared. With the exception of the mosque, there are no outstanding buildings in the city. The waterworks were constructed in 1571 by Sultan Selim II. With a strange combination of color and shabbiness, Mecca is one of the famous places of the world.

History.—The markets around Mecca attracted travelers of several tribes from many countries. Ideas were traded as well as articles, and a religious center developed in which beliefs could be exchanged. After Mohammed returned as master in 629 A.D., Mecca became primarily a religious center, with the Kaaba as the holiest site. Merchants with their caravans across the desert were secondary to the great hordes of worshippers who came to pay tribute at their holy city.

Fairs were held at varying distances from Mecca, toward which the travelers advanced until they reached the religious center. The calendar for religious ceremonies was arranged so that they coincided with a time when food products and merchandise could be sold. The people of Mecca and surrounding places flourished as a result of these annual trades. Despite the fact that the geographical location was largely desert, there was very great prosperity. Under the name of religion, commerce and business expanded. The merchants of Mecca, with the impetus of Islam, built a real empire, for all the smaller

markets and fairs were secondary to the location of the Kaaba. In the peak era, gems, drugs, silks, and other valuable commodities were brought from every corner of the Mohammedan world. This was followed by periods of war and strife, when Mecca was finally taken by the Carmathians in 930 A.D. The greatest loss was the sacred black stone from the Kaaba which was not regained for many years. The Egyptian influence which spread across the area was at its strongest in the 13th century. With the Turkish supremacy in 1517, additions were made to the temples and the sanctuaries. The Turkish authority lasted almost continuously until World War I, despite the Wahhabis (q.v.) and their movement for the reform of Islam. King Husain of the Hejaz overthrew the Turks in 1916, and since 1924, when Mecca became part of Saudi Arabia, has been ruled by its king, ibn-Saud.

The Kaaba.—The Kaaba has been the main worship place of Mecca since before the time of Mohammed. Abraham and Ishmael were supposed to have built it after a divine revelation. Later the traders from foreign lands brought their idols and established them here. Mohammed threw out the idols and made it the Moslem shrine. The Kaaba is a stone building with a door about seven feet from the ground. Although there are no windows, older historians have described it as having five, made of stained glass. The principal object is the black stone which Gabriel gave to Abraham and survived the period of idol-worship. Pilgrims arriving at Mecca kiss the stone as their first obligation. The Kaaba has many sacred corners for worship and dedication. One place is the legendary spot where Abraham stood when he built the temple. In the time of Mohammed the outside walls were covered with a striped cloth, and pilgrimages continue to bring coverings of embroidery and brocade. It has had many beautiful articles of decoration, such as silver doors and lamps, although many of them are gone. There is a well that tradition says was the source of the water with which Hagar baptized her son Ishmael. (See KAABA).

Pilgrimages to Mecca.—The last of the five pillars of Moslem faith is the obligation to make a holy pilgrimage to Mecca and Medina. Every person, faithful to the religion, must perform this duty at least once during his life. The pilgrimage takes place annually at a specified time, serving to develop a feeling of solidarity among the Moslems. People of all races and of varying degrees of poverty and wealth meet on an equal basis in their common devotion, for Islam does not recognize any barriers of race, nationality, or color. Women are permitted to make the journey as well as men. The pilgrims converge mainly from three directions. Those coming from the south are Mohammedans from Java, Sumatra, Indochina, India, and Iran, who pass across the Red Sea and on to Jidda, the port of Mecca. The northern group are from Asia Minor and Turkey, who go to the holy city by both land and sea routes. From the west, Egyptians, Moroccans, Algerians, and Tunisians reach Jidda through the Suez Canal. During some years more than 40,000 have passed through the canal on the way to Jidda. Throughout the pilgrimage a seamless garment must be worn, although a new one is put on before entering Mecca. No person is allowed to shave. or cut his hair or nails, or shed blood, or uproot any plants.

Arriving at Mecca, he must pass seven times around the sacred Kaaba and seven times between two adjacent mounds. On the way to Mina, which is outside Mecca, in the name of Allah he throws seven stones at the devil at each of three pillars. At Mina he also sacrifices a camel and a sheep, or some other horned domestic animal. The sacrifice falls on the tenth day of the month, which is celebrated throughout the Islam world as the Feast of Sacrifice. When a Moslem has completed the pilgrimage with all its many ceremonies, he is permitted to place the title *hadji* before his name. During the 20th century, between the two world wars, the average number of pilgrims was about 172,000 annually. Pop. (1946 est.) 120,000.

Bibliography.—Several accounts have been published which describe pilgrimages to Mecca, including: Burton, Richard F., *Personal Narrative of a Pilgrimage to El-Medinah and Meccah* (London 1855–1856); Keane, John F. T., *Six Months in Meccah* (London 1881). Also consult Ralli, Augustus J., *Christians at Mecca* (London 1909); Snouck Hurgronje, Christaan, *Mekka in the Latter Part of the 19th Century* (Leyden 1931); Hitti, Philip K., *The Arabs* (Princeton 1943); Byng, Edward J., *The World of the Arabs* (Boston 1944).

MÉCHAIN, mā-shăn', **Pierre François André,** French astronomer: b. Laon, Aug. 16, 1744; d. Castellon de la Plana, Spain, Sept. 28, 1804. He became a mathematical tutor and also devoted himself in free time to the study of astronomy. In Paris he gained the interest of the famous French astronomer Joseph Lalande (q.v.), who assisted him in getting a government position where he was engaged in the survey of the French coast and in astronomical observations. In 1782, Méchain was elected a member of the Academy of Sciences; in 1785 he became editor of *Connaisances des Tempes,* in which were published some of his most valuable scientific papers. The National Convention in 1791 commissioned him with Jean Delambre (q.v.) to measure the arc of the meridian between Dunkerque, France and Barcelona, Spain. Their resulting calculations failed to satisfy Méchain because of a slight discrepancy. Although he was appointed director of the observatory at Paris, he persuaded the board to measure the arc between Dunkerque and the Balearic Isles. He died of fever in Spain while on the mission. His accomplishments included not only the observation but also the discovery of several planets.

MECHANIC FALLS, Maine, a village in Androscoggin County, altitude 280 feet, situated on the Little Androscoggin River. Since 1850 paper mills have been located here. Freelan O. Stanley, an inventor, was once principal of the high school and, with his twin brother Francis E. Stanley, built the early engines for their automobile, the Stanley Steamer, in Mechanic Falls. Pop. (1940) 1,999.

MECHANICAL DRAWING. See DRAWING, MECHANICAL.

MECHANICAL ENGINEERING has been recognized as a separate branch of engineering since the formation of the Institution of Mechanical Engineers of Great Britain in 1847. Previous to that time there was but one branch of engineering in Great Britain other than military engineering, represented by the Institution of Civil Engineers (founded 1818), that was concerned with engineering for civilians. The development of textile machinery, steam engines, machine tools, pumping machinery, turbines, and locomotives of that time made such a diversity of interests for civilian engineers that these and allied subjects were called mechanical engineering. A similar division into specialties occurred in the United States when the American Society of Civil Engineers of 1852 was followed by the American Institute of Mining Engineers in 1871, the American Society of Mechanical Engineers in 1880, the American Institute of Electrical Engineers in 1884 and the American Institute of Chemical Engineers in 1908, as well as a number of others with more limited activities.

Mechanical engineering deals with the design, construction, and operation of machines and devices of all kinds, and with the research and sciences upon which these depend. Among these machines are the prime movers such as engines and turbines using air, gas, steam, and water as operating media; pumping machines and other hydraulic apparatus; steam boilers; heating, ventilating, air conditioning, and refrigerating equipment; transportation structures used in aviation, automotive engineering, railroads, and ships; machine tools; special machines for industry and for the construction of buildings, roads, and harbors. In fact, mechanical engineering enters into the work of all engineers when machines are to be developed for the processes of specialists of the other branches of engineering. As mechanical engineering includes the construction and operation of its structures, manufacturing methods, management, and personnel relations are important subjects of study and research, as well as economics, statistics, and sociology because of designs calling for great expenditures of money and for the services of the public.

To understand better the extent of the activities and interests of mechanical engineers, the following lists of professional divisions and of technical committees of the American Society of Mechanical Engineers (A.S.M.E.) are given:

Professional Divisions: applied mechanics, aviation, fuels, graphic arts (printing), heat transfer, hydraulic (cavitation, hydraulic prime movers, pumping machinery, water hammer), industrial instruments and regulators, management, materials handling, metals engineering, oil and gas power, power, process industries, production engineering, railroad, rubber and plastics, textiles, wood industries.

Technical Committees: standardization committees, research committees, safey committees, boiler code committees, power test code committees. Each of these groups is under the direction of a main committee which determines the policy of the group.

Although the titles in the above lists are quite clear to most people, it will be well to examine in some detail the work of certain of them.

Machine Designing.—Production engineering has as its basic subject machine design. This includes the study of analytic mechanics, mechanisms (kinematics), properties of materials including elasticity, strength and fatigue, chemistry, metallurgy and metallography, and production. Safety methods, management and control, and psychology are also used in production engineering where devices are built to function in accordance with the requirements determined by a theoretical study of a process or product. Such problems occur when power is to be produced by a gas turbine, or a machine is developed for electric deposition of tin upon a fast-moving strip of thin steel of great length for tin sheets, or one for the generation of high pressure steam of high superheat from some type of fuel. In other cases, machine elements are to be assembled to operate efficiently and dependably in proper sequence to reap, thrash, and bag wheat from a field when operated by automotive equipment, or to fill, cap, and deliver containers with some product held in a supply chamber. For all of these problems studies must be made on materials to be handled as well as on those used in the structure and their properties, and behavior may be ascertained only by research. Models of proposed solutions are made to fix the final design and to determine data not known when the design is initiated. Machine design is used in the production of hydraulic presses of high pressure by which airplane parts, gun shells and casings, body parts for automobiles, and metal containers are formed from sheet metal. It is also used in the production of printing presses for the daily newspaper or for multicolor lithographs in which sheets or strips of paper are carried from piles or rolls at a supply station, printed, cut, folded, and piled at the delivery point without any human aid in handling.

In the design of machines the subjects of vibrations, critical speeds, stress concentration, and fatigue are of great importance.

When parts of a machine are reciprocated or unbalanced parts are rotated, vibrations may be set up which result in excessive stresses or in movements of surrounding structures which may be at some distance from the moving part. To protect the machine and surrounding structures, the cause of the vibrations must be eliminated or lessened and sufficient materials must be used at places of excessive stress. The mathematical study of the forces set up by moving bodies to solve these problems is part of subject of mechanics and the applied mechanics division of the A.S.M.E. publishes results of investigations on vibrations. Instruments have been devised to measure vibrations of machines, and determine the amount and location of unbalance so that corrections may be made and parts of machines may be balanced before their incorporation into a structure.

In rotating shafts with attached parts the amount and distribution of loads and the size of the shaft fixes certain speeds of rotation at which excessive stresses may be set up. These are known as critical speeds and the shaft diameters must be chosen so that the speed of operation is not near the critical speed. If the operating speed is above the lowest critical speed, as critical speeds have harmonics, care must be taken to prevent rupture on passing through this low value.

When changes occur in the shape of the section of a machine part, the stress distribution so varies that an excessive value may occur at a given point. This is known as stress concentra-

tion and the amount of material used near this point is determined so that the concentration does not produce a stress above the allowable working stress. By the loading translucent models of structures photoelastic pictures from polarized light give the variation of strains so that stress distribution can be known.

When a load is removed and applied intermittently or reversed a great number of times, the part is subject to so-called repeated stress and as a result the stress at which the part will fail is much less than the ultimate stress because of the fatigue of the material. Investigations extending over many years and covering different types of loading and different structural materials have fixed the safe allowable stresses to be used when repeated stresses occur. See also Elasticity; Kinematics of Machinery; Mechanics; Strength of Materials.

Fuels and Heat Transfer.—The subject of fuels includes the study and use of solids, liquids, and gases; their transportation, preparation, and combustion, utilizing scientists and other engineers for this activity. The chemistry of combustion fixes the efficient utilization of fuel to produce the maximum amount of available heat by determining the necessary volume of the combustion space, the air fuel ratio, the manner of ignition, the temperature of ignition, the production of slag, and the condition of the fuel for proper ignition. The chemical analyses of the fuels and their products of combustion give the completeness of combustion and enable one to compute the heat losses in the exhaust gases when the temperatures of these are known. Theoretical considerations fix the amount of dissociation at high temperatures. By thermocouples and optical pyrometers high temperatures are measured.

The divisions of power and oil and gas power are concerned with the transformation of the energy of the fuels in engines and turbines with steam and by internal combustion in engines, turbines, and jets. In these applications the laws of thermodynamics (q.v.) are used to determine heat transfer and the conditions for the most efficient use of heat energy. Heat transfer by radiation, conduction, and convection depends upon temperature and the properties and surface conditions of the materials from which, to which, and through which it is transferred. If heat is to be transferred though a partition, the velocity of the substances on the two sides of this wall, as well as their properties, also affect the heat transfer. In investigations for new data and for the determination of performance instruments must be available for measuring temperatures, mass flow, and velocities, as well as viscosity, density, conductivity, and other physical properties of all substances taking part in the actions.

When the fuel is used in a boiler to produce superheated steam, the mechanical engineer must know the controlling factors for the heat transfer through steam-forming surfaces wetted with water, through superheaters, through economizers, and through air preheaters. He must, in the United States, follow the rules of design prescribed in the boiler code of the American Society of Mechanical Engineers as this is law in many states. He endeavors to increase the efficiency of the boiler by reducing the losses due to the temperature and composition of the flue gases, the radiation and conduction through the boiler setting, and the heat lost through the blow down necessary to maintain the proper condition of the water in the boiler. The mechanical engineer studies feedwater and boiler water to prevent foaming, incrustation, corrosion, and the embrittlement of steel for the water side of the boiler, and he scans the readings of his control instruments for evidence of soot on the gas side requiring the operation of the soot blower.

In 1824 it was shown by Nicolas Léonard Sadi Carnot (q.v.) that in any heat engine for highest efficiency of transformation all heat should be added to the cycle at one fixed temperature, that all heat should be removed from the cycle at another temperature, and that these temperatures should differ as much as possible. In the development of prime movers for the transformation of heat energy into mechanical energy this principle has guided the engineer in his arrangement of the cycle. When the principle could not be exactly followed, the nearest approach to it was made consistent with costs. If the increased yearly cost of apparatus to make a cycle more nearly equivalent to the Carnot cycle is not equal to the yearly savings from the improvement in efficiency, the change is not justified.

One attempt to approach the Carnot cycle without excessive pressures has been the use of binary vapors in engines and turbines such as the steam and sulphur dioxide engines of Prof. E. Josse and the mercury vapor and steam turbines of William LeRoy Emmet. In the latter, mercury vapor was used to reduce the top pressure and this vapor at exhaust was used to produce steam in a boiler which acted as a condenser for the mercury vapor. The steam was superheated, used in a turbine, and condensed in the usual manner. Josse eliminated the very low pressures of the final exhaust.

The most recent developments in prime movers have been the gas turbine and the airplane and rocket jet. The gas turbine has certain advantages in weight and cost although it requires the utilization of much of its generated energy for operation. Oil and gas have been used as fuels. In 1947, investigations and constructions were being made in which coal was used as the fuel for the gas turbine.

Since the latter part of the 19th century, internal combustion engines using gas, gasoline, and fuel oil have been perfected and are the most important forms of prime movers. Research and development are constantly improving performance as well as the properties of the materials used in construction. See also Internal Combustion Engine; Jet Propulsion.

Power Plants.—The design of power plants for the production of electrical energy is such an important phase of mechanical engineering that it is advisable to examine the various elements of this design. A preliminary study is made with the electrical engineers and business executives of a system of the present and future demands for energy at or near a given territory. From the ultimate demands for a steam plant and from the types and possible sizes of boilers and prime movers, the number and sizes of the units are fixed and the ultimate space requirements are determined, including the space for fuel storage, the amount of cooling water, and the needed transportation facilities. When internal combustion engines or gas turbines are to be used, this study would fix the same quantities, while

for a hydroelectric station the study is only made after a site is selected for which the necessary hydraulic and geologic data are known. The site finally selected from available land depends on price, soil conditions for foundations, available water supply, transportation facilities, fuel cost, including freight charges, facilities for removal of refuse, land occupancy in vicinity of site, and relation of location to the energy demands of the system. The layout of the plant follows the selection of equipment to meet the theoretical requirements for efficient and reliable operation of the station. The equipment includes fuel-handling machinery and storage structures with apparatus for preparation of solid, liquid, or gaseous fuel, boilers and accessories, pumps, draft fans and motors, chimneys and flues, and instruments to control operation and measure performance. The prime movers include engines and turbines with condensers when steam is used, piping for steam and water with pumps for air and water. The piping must be erected so that expansion may occur on changes in temperature. This requires extensive calculations of stresses in parts and forces on anchors. Models of the piping of reduced scale may be used to check results or to furnish needed data. Expansion in machines as well as in piping must be permitted to prevent rupture of piping or foundations. In plant layout, traveling cranes are provided for original erection and for removal of parts for inspection or repair.

In the layout of hydroelectric power plants the study of the stream flow at a selected site covering the record of many years and the probable storage capacity fixes the prime power available throughout the year, and from financial and physical considerations the secondary power for part of the year is determined as well as the operating head. From these the number and size of the units may be fixed with consideration of the size limitations of shop and transportation facilities. From the selected size, possible speeds of the electric generators and the operating head, the type of turbine is fixed by the so-called specific speed (speed multiplied by the square root of the horsepower divided by the five-fourths power of the head). For high heads the specific speed is often low and a Pelton type of water wheel is used, while with low heads the high specific speed demands a propeller type of turbine. For intermediate specific speeds the Francis type of turbine is used. It sometimes happens that the specific speeds available and the head with the actual speed of rotation fixes the greatest power from one unit. To prevent the separation of the water from the turbine blade, known as cavitation and due to low pressure in the draft tube, the depth of water at the discharge of the draft tube below the tail-water level is made equal to a computed limiting depth. The draft tube is the conduit between the turbine and the discharge canal or tailrace. It is used so as to place the turbine at an elevated position and as a regainer of much of the kinetic energy of the water at the discharge point of the runner. Cavitation produces erosion of the blades and its occurrence must be prevented.

The design of the dam and its construction result after the study of the geologic conditions at the selected site has fixed the permissible bearing power of the soil. When the dam is a high concrete structure, this is cooled by refrigeration during construction to remove the heat generated in the aging of the concrete so as to reach a safe state before the water is impounded in the storage reservoir. Penstocks or pipes are designed to bring water to the turbines and the tailrace must be cleared to deliver the discharge freely. Studies must be made of the backwater curves above and below the station to ensure a known rise of the water at the upper end of the storage reservoir and the stream supplying it and to make certain that the tail-water level is that desired at the power plant. The backwater curves or surfaces of the streams are computed for the maximum flow conditions. To prevent damage to the dam, excess water in times of flood is discharged over a spillway designed to care for the probable maximum flow at the site. The design includes ice chutes for winter and fishways to care for fish which ascend the stream for spawning.

In fixing the number and size of units for a station, spare equipment must be installed in an isolated station to care for the outage of the largest unit; while in a system station the number and size of units are fixed by the maximum output desired, any outage being cared for by other stations. Stations with equipment of high efficiency are used as base load stations operating at full load, the changes in system load being carried by other stations. A stand-by station to be operated when failures occur in other stations or for occasional short peak loads is designed with less efficient and less expensive equipment because of its infrequent use. The few hours of use do not justify high costs.

In all central stations complete instruments and regulators are used to give records of operating conditions and performance so that improper conditions may be corrected and from which costs of production can be determined and efficiencies of various elements computed.

For the pumping of water and its distribution, large pumps, welded pipes, and canals have been designed and built. These have required the testing of models to determine the effects of changes in design and anticipated performance of the full-size project. See also ELECTRICAL ENGINEERING; HYDRAULICS; POWER HOUSES; PUMPS AND PUMPING MACHINERY; TURBINE.

Heating, Ventilating, Air Conditioning, Refrigeration.—The subjects of heating, ventilating, and air conditioning of buildings and the heating and refrigeration of materials require a knowledge of heat transfer, the properties of fluids and gases, the properties of building materials and of the materials to be stored or processed, as well as the requirements for health and comfort of persons. This division of engineering includes not only the selection of equipment but also its design, manufacture, and operation. During the period of World War II this field of engineering was greatly expanded owing to war conditions as well as for the necessity of uniform atmospheric condition for the processes of many industries.

These subjects require the determination of the heat loss or gain through partitions, walls, floors, and roofs after the application of insulating materials, and the amount of heat from illuminants, machines, materials, and occupants, and finally the necessary addition or removal of heat to maintain a required condition. This heat is transferred by conduction or radiation through conduits or radiators carrying a fluid to absorb

or deliver heat or by air in condition to effect the same result by convection. The computations are based on the results of research regarding heat transfer of surfaces and materials by convection, conduction and radiation, the heat developed by manufacturing and physical processes, by lighting equipment and machines, by materials to be stored, and by human occupants. Studies have been made to fix condition of human comfort as well as those required by manufacturing processes. The effect of the wind and the sun on heat demand has been found by research which is continuing after many years.

Although radiators for direct heating and neated air for indirect heating have been used extensively, radiant heating from fluids in pipes imbedded in partitions, floors, or ceilings is now (1947) being applied in many buildings for convenience, comfort, and efficiency.

To prevent heat loss from buildings or from pipes and ducts conveying the heating fluid, insulating materials are applied. These materials and their amounts at any particular location depend on temperature difference as well as upon exposure, velocity of the ambient fluids, and atmosphere. Their composition and properties have resulted from extensive research and design of manufacturing processes.

Control apparatus has been developed by mechanical engineers by which the temperature and humidity are maintained throughout a region in which heat demands and occupation may vary over a wide range. Not only are thermostats and humidostats employed, but valves are operated by relays so that the necessary alterations are made to the system to meet the changed conditions.

Mechanical refrigeration is accomplished by producing a low pressure around a liquid refrigerant so that it will vaporize and remove heat at low temperature and then by compression producing such a pressure that the resultant vapor in tubes will be condensed by the abstraction of heat by the surrounding water or air at atmospheric temperature. Compressors used for this purpose of maintaining low pressure in one part of the system and a higher pressure in another part are of the piston and cylinder form when the pressure difference is great and of the centrifugal form when small differences of pressure are required. At times these pressure differences are maintained by the partial pressure of a noncondensible gas in the evaporating section of the systems, and then permitting the pressure to rise by separating the noncondensible gas for condensation, or the low pressure may be maintained by absorbing the low pressure vapor by a liquor or adsorbing it by a solid from either of which it is released at high pressure by heating the resultant liquor or solid. In each of these systems the method of action is the equivalent of that first stated.

Refrigerants are supplied to heat transfer coils or surfaces for the removal of heat from materials or spaces. When the accidental escape of fluid or vapor would be deleterious to persons or materials, heat is first removed from brine by the refrigerant and the brine is circulated in the regions to be refrigerated. The piping used for circulating the primary or secondary refrigerant must be fully insulated whenever conditions exist under which heat may be absorbed by it. Not only the piping but the cooled spaces must be carefully insulated by various materials developed for this purpose. These include cork products, mineral wool, asbestos, aluminum foil, fiberglas, and flotofoam, a synthetic plastic.

To obtain the large amount of cooling water for the condensers of refrigerating systems, cooling towers are used in which the warming of air supplied by fans and the evaporation of some of the falling hot water so cools the latter that it may be sent to the condensers to continue its heat removal.

The cycles used in refrigerating machines remove heat from places required to have low temperature by vaporizing liquid refrigerants places in coils. After the vapors are withdrawn from the coils and compressed to a higher pressure, they are condensed by cooling water at atmospheric temperature. The refrigerant then repeats the cycle and is thus reused indefinitely. The heat in the water is heat from the cooling coils, plus heat equivalent to the work of compression. Such heat is usually thrown away, but in the second half of the 19th century, William Thompson (Lord Kelvin) suggested that it might be used for heating buildings in cold weather. This "heat pump" of Thompson's was never used commercially until after the first quarter of the 20th century. In these applications, heat is drawn at low temperature from the atmosphere, or from well water, by the evaporation of the refrigerant, so that this heat, plus heat from the work of compression, can be used for space heating. The cost of such heat is only that of the small amount of power used for the compressor. After installation, the same equipment may be used in summer for air conditioning by merely shifting a few valves or dampers, which interchange the functions of the evaporator and the condenser.

Ice making is one of the applications of mechanical refrigeration for which studies have been made to produce clear ice from raw water, eliminating the work of distillation. See also AIR CONDITIONING; BUILDING MATERIALS, EQUIPMENT, AND TECHNIQUES; HEATING; REFRIGERATION; VENTILATING.

Railroads.—Railroad mechanical engineering is concerned with the development and improvement of motive power, cars and the air conditioning and refrigeration of them, the elimination of friction in bearings of wheel axles, the reduction of vibration of cars, the treatment of boiler water, the improvement of combustion, the operation of shops, and the maintenance of all equipment. During the fourth decade of the 20th century the Diesel engine for motive power was so increased so that by 1945 over 3,000 Diesel units were in service. These engines were connected to generators which supplied electric energy to motors on the locomotive trucks eliminating the vibrations of the steam locomotive and giving uniform torque on starting. In 1945 steam turbines were applied by gears to driving wheel axles of a locomotive and later designs were being completed for the application of a gas turbine to the locomotive. To reduce the crank pin loads on locomotives, four cylinders were applied in place of two large cylinders.

Marine and Aviation Engineering.—Marine mechanical engineering is devoted to materials handling, fire protection, drainage, steering, water supply and plumbing, kitchen equipment, elevators, heating, ventilating, air conditioning, and refrigeration, as well as to boilers and prime movers.

The professional division of aviation is concerned with the theoretical study of flight, the design of the plane and its parts, the power plant and accessories as well as air conditioning for temperature, humidity, and pressure. The manufacturing and maintenance methods, the materials to be employed for parts and the instrument to be used for operation are all as important as the design principles used in planning. Not only are wind tunnel tests necessary but materials and production methods must be tested for suitability, accuracy, strength, and durability. Testing of finished planes or models in flight and in special maneuvers with instruments for measuring performance and stresses in various structural elements supplement the works of the wind tunnel. There are peculiar requirements for the airplane power plant which demand special study for engine, turbine, or jet. The variation of air density and temperature require special devices or materials such as superchargers, or special lubricating oils. See also AERONAUTICS.

Materials Handling.—Materials handling includes the design, construction, and operation of cranes, elevators, conveyors, traveling belts, chutes, transveyors, cableways, hoists, draglines, shovels, and excavators, car handling devices, ship loading and unloading devices, industrial railways, tractors, trucks, coal and ash conveyors, trolleys, and pneumatic conveyors. These are really devices planned by the principles of machine design after data relating to power for driving and peculiarities of operation have been determined by research. Studies must be made of the required performance and the cost and adaptability of different devices or systems by which desired results may be accomplished. See also CONVEYOR.

Wood Products, Textiles, and Metals.—The division of wood products is concerned with all steps from logging to the final product, and includes the studies of the wood during these stages as well as the machines required throughout the processes. The developments of compressed plywoods and the methods of gluing have extended the use of wood for many purposes. (See also WOOD CHEMISTRY AND NEW USES.)

For textiles, mechanical engineers not only design and produce machines for carding, spinning, weaving, and knitting but they lay out, build, equip, and operate the mills in which these machines are employed. Mill operation of the process industries require a study of management, production control, labor relations, purchasing and selling as well as maintenance and power supply. (See also TEXTILE MACHINERY.)

Metals engineering covers the construction of machine tools, furnaces, rolling mill equipment, and the instruments for control of the operations and the testing of products. Many of the operations dependent on human strength have been made mechanical. Devices for safety and human comfort have been introduced. Conditions of operation have been made uniform so that product can be predicted. The tools used in metals industries have been improved and the metallographic studies have so changed their quality that longer life of service and less power demand have been secured.

Professional Training.—To prepare for the profession of mechanical engineering one may advance from the shop through study at the company institute of many organizations, or through home study, or one may advance through practice after graduation from a four-year course in a school of engineering. In each of these cases the engineering training is based, in the United States, on the graduation from a four-year high school program, or its equivalent. The studies include four years of English, four years of mathematics, one or two years of science, three or more years of foreign languages, and electives from such subjects as science, history, civics, or music to bring the total credits to 14 or 15 one-hour courses each extending over a year. Because of the future development of the young engineer, his studies in the school of engineering, in the company institute, or in self-education should be extensive and intensive and designed to develop in him the ability to analyze and reason from known data with self-reliance, persistence, thoroughness, dependability, loyalty and the spirit of cooperation, rather than to give him merely facts from which to find solutions to problems. The training should fit him to develop ability, breadth of knowledge and judgment after the formal training is completed.

With this in view, the course of study includes a thorough grounding in mathematics through differential equations, physics, chemistry, metallurgy, English, economics, social science, and psychology to which are added subjects common to most engineering courses and special mechanical engineering subjects. The general engineering subjects so prepare the graduate mechanical engineer that he may enter one of the other branches of engineering should opportunities and conditions make such a change advisable. The success of many engineers in branches different from that from which they graduated is evidence of the value and thoroughness of the training in those general courses.

These general subjects include engineering drawing and descriptive geometry (universal language of engineering), elementary surveying, power generating machinery, mechanism, statics and dynamics of analytic mechanics, strength of materials, thermodynamics, direct and alternating current electric machinery, hydraulics, machine design, and a course dealing with engineering administration. Among the special mechanical engineering subjects from which selections are made are heat power, engine and boiler design, power plants, heating, ventilating and air conditioning, refrigeration, hydraulic power, production methods and mechanical engineering laboratory.

Free electives are open in languages, philosophy, art and archaeology, biology, astronomy, geology, and politics.

The records of the graduates of engineering schools indicate that after a few years many become supervisors or administrators rather than designers and producers, and for this reason the curriculum of the school of engineering should be planned to develop breadth of vision and the sympathetic consideration of the views of others while it trains the student thoroughly in the professional subjects which he must know to guide others under his administration.

Throughout the United States the practice of professional engineering as an individual requires a state license. This is granted by a state board upon the presentation of evidence of approved practice of engineering for eight years and the passing of an examination.

ARTHUR M. GREENE, JR.,
Dean Emeritus, School of Engineering, Princeton University.

MECHANICAL MOVEMENTS, POWERS AND APPLIANCES. The primary, fundamental mechanical contrivances are termed the mechanical powers, seven in number and all based on the principles of either the lever or the inclined plane. The common classification is the lever, wheel and axle, cord and pulley, toothed wheels (these four operating on the lever principle), and the inclined plane, wedge and screw (operating on the principle of the inclined plane). What are known as the mechanical movements (sometimes called mechanical motions) include about 750 of the more or less simple and common combinations, covering practically all the fundamental arrangements of the mechanical powers for machine building and engineering work. They constitute the groundwork which the machinist or student of engineering must master before he can make much headway in understanding the complex problems which arise in practice.

Taking first the simple lever, it is found to be of three classes: (1) those in which the fulcrum is situated between the power and the weight; (2) those in which the fulcrum is at one end of the lever arm with the weight nearer to it than the power; and (3) those in which the fulcrum is at the end with the power nearer to it than the weight.

In the first, if the weight W is nearer to the fulcrum, there is a mechanical advantage —illustrated by the crowbar, which on account of the great difference in the length of its arms is advantageously used to overcome great resistance. Scissors and nippers are double levers of this class. If the power P is nearer to the fulcrum, there is a mechanical disadvantage, and if the weight and the power are at an equal distance on either side of the fulcrum, the power is equal to the weight and gives an arrangement similar to the ordinary balance.

The distinction between the gain of power

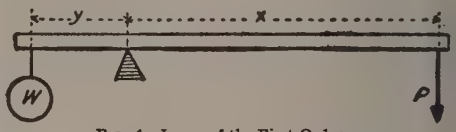

FIG. 1—Lever of the First Order.

and the loss of velocity, and the reverse of these conditions, as depending upon the position of the fulcrum, is exemplified by the shears used for cutting metal and those used for cutting cloth, respectively. In the former, short blades with long handles overcome a great resistance slowly; while in the latter, long blades operated by short handles, move quickly.

In the second class there is always a mechanical advantage. The wheelbarrow is an example of the simple lever. The fulcrum is at

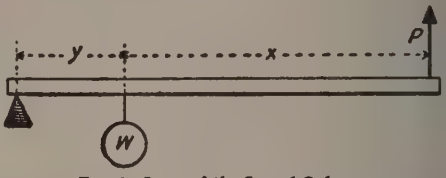

FIG. 2—Lever of the Second Order.

the centre of the wheel, the weight acts downward at the centre of gravity of the load and the power is applied at the ends of the handles. A hinged nut-cracker is an example of a double level of this kind.

In the third class there is always a mechanical disadvantage; but great rapidity of movement is obtained. The human forearm is an example of a simple lever of this class. The fulcrum is at the elbow-joint, the weight acts downward at the hand and the power is applied

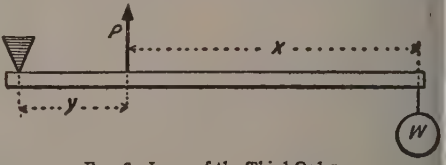

FIG. 3—Lever of the Third Order.

obliquely by a tendon from the biceps muscle attached near the elbow. A pair of tongs is an example of a double lever of this class.

The wheel and axle consists of two cylinders of different sizes rigidly connected together and turning about a common axis. The larger cylinder is called the wheel and the smaller the axle. The power is applied to the end of a rope wound around the wheel and the weight is raised by a rope wound around the axle;

see Fig. 4. The diameter of the larger cylinder or wheel being twice that of the smaller cylinder, or axle, a power of one pound at *P* will balance a weight of two pounds at *W*. This is essentially a form of lever, and «the power is to the weight lifted as the radius of the axle is to the radius of the wheel.» The principle is applicable to all forms of hoisting machines, steering gear of ships, fusee clock

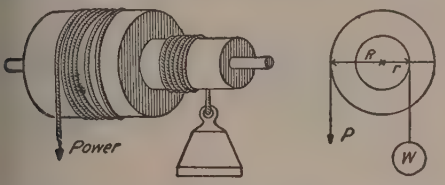

Fig. 4.

and watch movements, etc. If the axle be fixed and the wheel be loosely mounted to revolve on it, we have the ordinary machinist's loose pulley and a variety of uses suggest themselves. If the axle be fixed to the body of a carriage and the wheel allowed to rest on level ground, we find that the carriage can be drawn along with slight effort, requiring a push or pull representing only a small fraction of its weight.

The cord and pulley shows the further uses of the wheel as a lever. In the arrangement shown in Fig. 5 the upper points *F* are fixed, being virtually fulcrums; a downward pull of one pound one foot on the cord *P* will raise the weight *W*, which may weigh nearly two pounds, a half foot; it would balance two pounds but for the loss by friction.

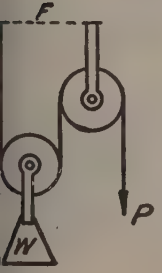

Fig. 5.

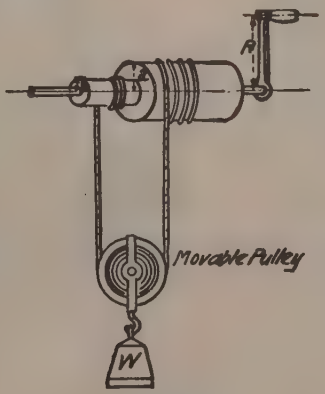

Fig. 6.

In Fig. 6 a movable pulley is shown in combination with the wheel *a* and axle *b* and a crank *R* is added. If the crank is one foot long, the wheel one foot in diameter and the axle six inches in diameter, one turn of the crank may draw up the right hand cord about three feet, and lengthen the left hand cord about 18 inches, resulting in raising the pulley and attached weight *W* 9 inches. As the crank handle has traveled about six feet, or eight times as far as the weight is raised, the leverage is 8 to 1, and a boy who can put 50 pounds of effort on the crank can raise nearly 400 pounds at every turn, and in eight turns he will raise it six feet, the distance of travel of the crank at one turn.

A very common arrangement of pulleys, called stepped pulleys, is shown in Fig. 7, as positioned for driving a lathe. The steps of the pulleys on the lathe are supposed to be 3, 6, 9 and 12 inches diameter, respectively. The belt is shown on the 12-inch power pulley and 3-inch lathe pulley, and obviously, if the power shaft is making 100 revolutions per minute, the lathe-shaft will make 400. If the belt be shifted to the next step, where the proportions are 9 to 6, the 100 revolutions of the power shaft will give 150 revolutions of the lathe shaft. On the third step 6 to 9 is the proportion and the lathe will rotate at a speed of 66⅔ revolutions; on the fourth step it is 3 to 12, and the 100 revolutions of the power shaft will give but 25 of the lathe shaft. See Pulley.

Toothed wheels, now commonly called gearwheels, illustrate another type of wheel leverage. Spur gears are shown in Fig. 8; here the smaller gear-wheel rotates twice to cause one revolution of the large wheel; thus a small wheel secures increased power at reduced speed.

In Fig. 9, the large wheel, being the driver, turns both the small wheels in the same direction, but oppositely to itself, and gives the shafts of the small wheels two revolutions to one of the large wheel. In Fig. 10 are shown bevel gears, which coact at right angles. It is apparent that almost infinite combinations of such gears are possible. See Wheel Gearing.

The inclined plane is simply a rigid fixed

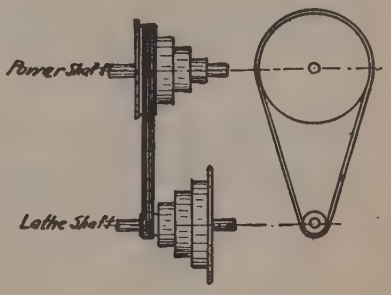

Fig. 7.

plane inclined to the horizon at an angle, and upon which a weight tends to slide down by gravity, or up the slope of which a weight may be pushed or rolled by a force usually horizontal in its action. In Fig. 11 the sliding weight would fall back if the power was withdrawn; it also shows power applied horizontally to move a rolling weight up the plane. In this latter case a continuing power of less than a pound will push a pound roller up the incline because the power has a distance greater than the height overcome in which to exert itself.

The inclined plane principle is used in rolling barrels up on a wagon, in loading logs on a sled, in the operation of a mountain railway and in the cam, which is described later. The employment of the principle does not reduce the work of lifting to the top of the plane, but extends the time of the lift, so that a smaller force used for a longer time does the work.

The screw is essentially an inclined plane wound spirally around a cylinder, in the form of an advancing groove, known as the screw-thread. A cylinder having such grooves cut interiorly like the inside of a nut is termed a female screw. The screw shown in Fig. 12 has two grooves spiraling around and is therefore double-threaded. There being eight threads to

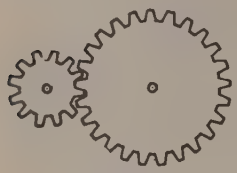

FIG. 8.

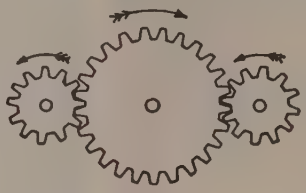

FIG. 9.

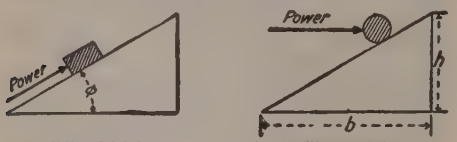
FIG. 10.

The wedge (Fig. 11a) is a double plane and gives power at the expense of speed. It is sometimes considered as a combination of two inclined planes placed base to base. The mechanical advantage increases as the angle of the wedge decreases — «the power being equal to twice the resistance into the sine of the angle of the wedge.» The relation, however,



Sliding Weight. Rolling Weight.

FIG. 11.

has but little practical value since the resistance due to the friction is very great. The principle is used in many forms of cutting tools such as the knife, the chisel, axe and plane. For working in comparatively soft materials, the angle is kept small and the edge sharp; but for harder materials the angle is increased. Metal planing tools have very large angles, ranging from 60

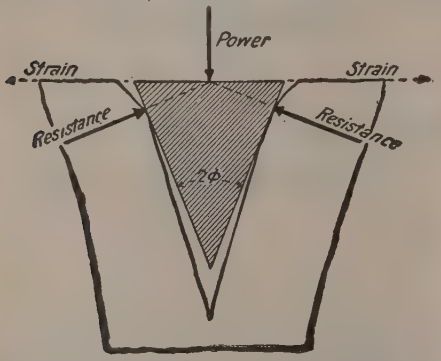


FIG. 11a.

degrees to 80 degrees. When the wedge is employed for cleaving wood, the cohesion and friction combined produces so great a resistance that the force is applied in the form of a blow from a heavy body, and the resulting strain is equal to the force of the blow multiplied by the length of the wedge divided by its width. See WEDGE.

the inch, the pitch of this screw may be regarded as one-eighth of an inch, the distance between threads; or as one-fourth of an inch, the distance between one spiral and the next turn of the same spiral. The principle of the screw is used in the screw propeller (q.v.), and the lifting jack or jackscrew. See SCREW.

A mechanical movement is some simple combination of the elementary powers described above. Perhaps the simplest are the familiar crank (q.v.), cam (q.v.) and cylinder and piston. (See STEAM AND STEAM-ENGINES). A

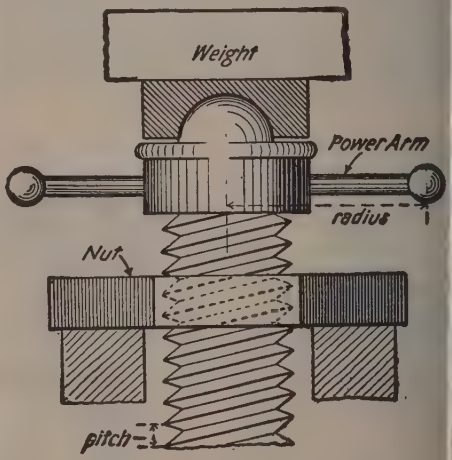

FIG. 12.

few of the more familiar movements are here grouped and illustrated. If fully mastered and understood they will be of great assistance to the student of mechanics in understanding the more difficult and complicated descriptions and drawings of modern machinery.

Fig. 13 is a rack and pinion, for converting rotary motion into linear motion, or the reverse, according to whether the rack or pinion is the driver.

Fig. 14 shows a pinion between two racks. If the lower rack be fixed and the pinion rolled one foot the upper rack will move two feet. In this way the stroke of a piston can be doubled.

Fig. 15 is a gear-wheel and worm, for changing a rapid rotary motion into a very slow rotary motion. One rotation of the worm turns the gear-wheel the distance of one tooth.

Fig. 16 is a group of bevel gears, positioned as in the differential on the rear axle of an automobile. Either of the large bevel-gears may drive the other through the small bevel-gear.

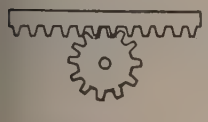

Fig. 13.

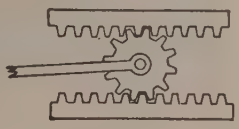

Fig. 14.

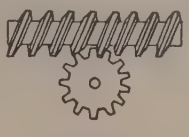

Fig. 15.

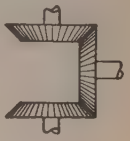

Fig. 16.

Fig. 17 is a mangle wheel and pinion. The pinion *P* drives, traveling around the long C-shaped rack, rotating the mangle first into one direction then in the reverse direction.

Fig. 18 is a pair of eccentric gear-wheels, either of which may be the driver. The rotation of the driven wheel is alternately slow and rapid.

Fig. 19 shows a couple of pump-cams. As they touch at every point of their rotation they may be used to raise a column of water by lifting.

Fig. 20 is a diagram of a crank and piston movement. It will be noticed that the spot *s* on the centre of the piston rod describes an oval. The nearer this spot is placed to the piston the more elongated is the oval. If the student will make a pattern of this in cardboard and test it in various positions he will get a far better understanding of why a crank motion is so generally preferred in machinery for altering rotary into reciprocating motion — the change is so gradual that jar is obviated.

Fig. 21 is a lazy tongs or combination of levers which support each other and permit rapid change of position.

Fig. 22 is a combined bell-crank and wheel-crank for altering rotary motion into reciprocating. The wheel drives and as the pin *p* travels in the slot it raises and lowers the rod *r*, rapidly in one direction, more slowly in the other.

Fig. 23 is a parallel motion. To whatever distance the bars are moved they are held parallel by the slanting connections.

Fig. 24 is a shears for cutting metal. The wheel *w* and pin operate the upper blade, giving a long leverage for increased shearing power.

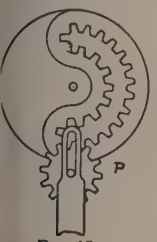

Fig. 17.

Fig. 18.

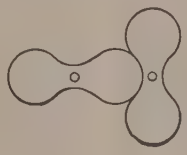

Fig. 19.

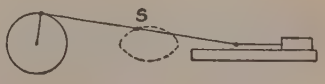

Fig. 20.

Fig. 25 is a toggle joint. Only a slight force is required to throw the two levers into line exerting a vastly multiplied energy over a short distance. It is used in many machines to apply a sudden pressure.

Fig. 26 is a universal joint, permitting a rotating shaft to be bent to a slight angle as necessary, without interfering with its working.

Fig. 27 is a three-throw cam. The three-pointed wheel measures the same at every point of its diameter, and as it rotates gives a reciprocating motion to the rod, moving it back and forth three times to each revolution.

Fig. 28 is a heart-cam for giving irregular reciprocation to the rod.

Fig. 29 is an ore-stamp. The cam shaped like a long *s* raises the stamp twice during each revolution and leaves it free to drop by gravity.

Fig. 30 shows a drum-shaped cam *C* whose groove moves the shaft *S* of the large wheel *W* alternately to the right and left.

Fig. 21.

Fig. 22.

Fig. 23.

Fig. 24.

Fig. 31 is an eccentric, or wheel mounted out of centre, so that through the encircling straps it gives a reciprocating motion to the rod. It is much used on steam-engines.

Fig. 32 is a pair of pulleys connected by a twisted belt for reversing the direction of rotation of one of the shafts.

Fig. 33 is a two-speed gear. The pulley *a*

being the driver, the upper large pulley is driven on one speed; when the belt is shifted to *b*, which is a loose pulley there is no driving; when the belt is shifted to *c* the other drive at a different speed is effective.

Fig. 34 is the steering gear of a sailing vessel, showing how the turning of the hand-wheel *w* is made to shift the ropes *rr* and throw the tiller *t* of the rudder to right or left.

Fig. 35 is a positive «silent» chain drive. Either the chain or gear-wheel may drive. It is used on auto-trucks and a variety of heavy machinery where belts are inadequate.

Fig. 36 is an intermittent motion given the toothed wheel by the rotation of the notched pinion. Every time the notch comes around it advances the wheel one tooth.

Fig. 37 is an escapement. The levers are connected with a pendulum or the like and at every swing allow the wheel to turn one notch.

Fig. 38 is a ball governor as used on steam-engines. When a certain speed is exceeded the balls are thrown out by centrifugal force, and rise, opening a valve or adjusting a cut-off and thus reducing the speed back to the normal.

«Compound motions» are obtained by combining any two or more of the simple motions, and machines are built up by combining the simple motions harmoniously.

Fig. 25.

Fig. 26.

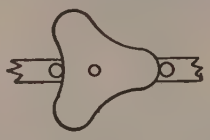

Fig. 27.

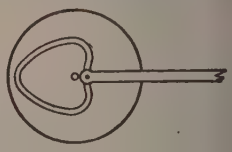

Fig. 28.

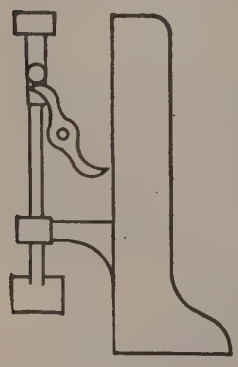

Fig. 29.

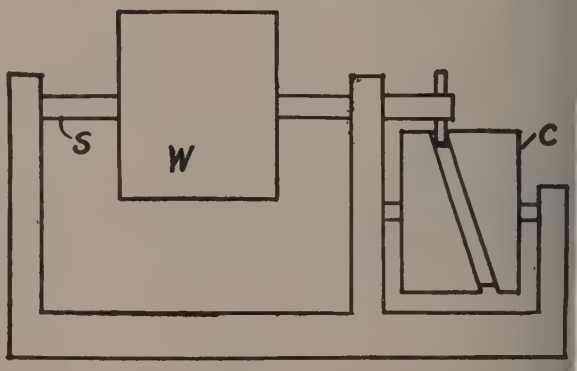

Fig. 30.

«Pendulum motion» is the oscillatory motion of a body in the arc of a circle, the body being attached to a rod which vibrates to and fro from a fixed axis. In the ideal simple pendulum, consisting of a body attached to a string without weight and vibrating from the point of suspension without resistance of any kind whatever, a material body once set in motion would continue to swing to and fro forever.

Under these conditions it has been noted (1) that the time of vibrations of a pendulum through short arcs is independent of the lengths of the arcs and that when the length of the arc is constant, as in the case of clock devices, the times of vibration are equal; (2) that when the force of gravity is constant, as is the case of any given point on the surface of the earth, the time of vibration varies directly as the square root of the length of the pendulum, so that, if a pendulum of a given length vibrates in one second, a pendulum one-quarter as long will vibrate in one-half of a second, and one four times as long will vibrate in two seconds; (3) that when the length of the pendulum is constant, the time of a vibration varies inversely as the square root of the force of gravity; and (4) that when the time of vibration of two pendulums at different points on the surface of the earth is equal, their lengths vary directly as the force of gravity. See PENDULUM.

«Perpetual motion» is a continuous or incessant motion supposed to be attainable by a mechanical device with inherent motive energy, and, therefore, which when once set in motion is capable of continuing that motion indefinitely or perpetually. Such a device or machine, if practicable, might be termed a «perpetual movement.»

The various forms of mechanical movements embodying the principles of one or more of the mechanical powers already described are so innumerable that a detailed description of them is impracticable within the scope of this article; but they are classified as follows into several important groups according to the general purposes for which they are used.

«Transmission of power appliances,» consisting of ropes, belts and various forms of gears, pulleys, etc.

«Measurement of power appliances and devices,» used for determining velocities, pressures, weights, number and quantities, such as brakes, counters, dynamometers, gauges, indicators, meters, planimeters, testing machines and weighting machines.

«Steam power appliances,» comprising boilers, locomotives, locomotive engines, oscillating engines, rotary engines, steam-engines, steam turbines, valves and valve-gears, parallel motion gears, governors and other engine devices.

«Steam appliances,» such as injectors, steam pumps, condensers, separators, traps and valves.

«Motive power machines,» such as gas-engines, internal-combustion engines, heat-engines, solar engines, etc.

«Hydraulic power appliances and devices,» consisting of various forms of waterwheels, water-motors, turbines, pumps, syphons, water-lifts, ejectors, hydraulic or water rams, meters, indicators, pressure regulators, valves, pipe joints, filters, hydraulic presses and hydraulic

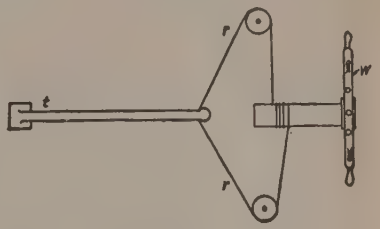

FIG. 34.

metal-working machinery such as riveters, rail-benders and punches.

«Air power appliances,» devices and apparatus consisting of air compressors, air pumps, air water-lifts, barometers, bellows, blowers, blow-pipes and compressed-air tools such as pneumatic drills, hammers, riveters and shearing machines. Also, gauges, ventilators and musical instruments.

«Electrical power and construction appliances» such as generators, motors, wiring devices, controlling and measuring devices, lighting arrangements, electric furnaces, heaters, fans, searchlights and drilling machines.

«Navigation appliances» used for operating

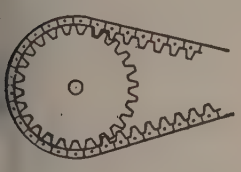

FIG. 35.

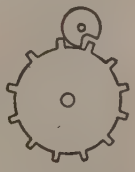

FIG. 36.

steamships, sailing vessels and yachts, such as sails, rope knots, block and tackle, paddle wheels, screw propellers, steering gear, anchors, windlasses, capstans, cranes, etc.

«Road appliances,» used in the construction of roads, highways and railroads, such as scrapers, rollers, excavators, vehicles, automobiles, bicycles, motor adjuncts, wheels, road gates, lamps, etc.

«Gearing,» consisting of rack and pinion devices, spiral, elliptical and worm gears, differential and stop-motion gears, and epicyclical and planetary trains.

«Motion and controlling devices,» consisting of rachets and pawls, cams and volute cams, cranks and variable cranks, intermittent and stop motions, wipers, shafts, couplings and gyroscopes.

«Horological apparatus and devices,» mainly used for measuring time, such as spring and pendulum clocks, watch and chronometer movements, electric clocks and sundials.

«Mining machinery and appliances,» such as quarrying and cutting machines, borers, drills, valves, blowers, ventilators, safety lamps, hoisting drums, conveyors, crushers, pulverizers, hydraulic nozzles, presses, air-blast and magnetic separators, steam shovels, dredges, haulage appliances, furnaces and automatic dumps.

«Mill and factory appliances,» such as hangers, shaft bearings, ball bearings, steps, couplings, universal and flexible couplings, speed gears, shop tools, screw threads, hoists, stamp-mills, saws, punches, shears, bending machines, grinding machine, cotton presses, looms, knitting machines, etc.

«Engineering construction appliances,» such as mixing machines, testing machines, stump and pile pulling machines, blocks and tackle, hoisting machines, tackles hooks, pile drivers, automatic dumps and dumping cars, stone grips, derricks, conveyors, timber splicers, metal welding devices, tools, wood-preserving apparatus, cable carriers, dams and embankment escalators and moving platforms, «Ferris» wheels, high structures and buildings, roof and bridge trusses, trestles and bridges.

FIG 37.

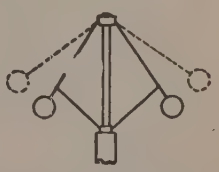

FIG 38.

«Agricultural machines and implements,» such as plows, tethering hooks, wash boilers, washing machines, mowers, grain harvesters, threshing machines, cream separators, refrigerating machinery, cold storage houses, refuse crematories, silos, kilns, ovens and furnaces.

«Draughting devices,» such as dividers, dotting pens, parallel rules, curve delineators, trammels, ellipsographs, pantographs, etc.

«Tools,» hand and machine, such as saws, chisels, mallets, planes, borers, etc.

«Perpetual motion devices,» consisting of various forms of hydraulic, hydrostatic and magneto-electric apparatus.

Bibliography.— For descriptions of a great variety of special movements, appliances and

devices, consult the works on the subject by Hiscox, Rheile, Ruleau and Spon, also the special articles on the various forms of appliances enumerated under the general classes stated in this article.

CHARLES H. COCHRANE,
Author of 'Wonders of Modern Mechanism.'

MECHANICAL SIZING. Classification of Dry Granular Material.— The mechanical classification of dry granular material is the result of the action of several natural laws operating in conjunction with a mechanical device so arranged as to permit the balancing of the action of one law with another. The combined motion places the relative action of the dry granular material completely under control of the mechanical device. The first active law in mechanical sizing is termed the laws of selectiveness. When mixed particles of various sizes of granular material are under agitation upon a level plane, the finer particles sink to the bottom and engage the surface while the coarser particles rise to the top without regard to the specific gravity of such particles. The second active law is called the law of displacement or the displacement of the centres of gravity of particles upon an inclined plane. The relative difference in the tendency of coarse and fine material of granular shape to move down an inclined plane is due to the difference in the displacement of their centres of gravity upon the same angle of plane. The third active law is the law of friction of mass or the "coefficient of friction."

Close observation of the action of these laws as well as the influence of other forces led to the design of a "mechanical sizer" simply arranged to best meet the requirements of these laws. In order to assist the law of selective action on an inclined plane, a series of several hundred tapered riffles or grooves are placed on the inclined surface of what is termed the deck of the device. This permits the "fines" to sink to the bottom of these grooves and forces the discharge of larger particles over the top of the riffle, in accordance with the action of the law of displacement of centres of gravity. This is accomplished by the feeding of dry material to the inclined deck while the same is being agitated forward and backward by a specially designed head motion, which pushes the deck forward at one speed and causes it to return at a higher speed. This sets up what is termed a progressive action of material on the deck or causes the granular particles to travel in a forward direction, under the government, however, of the law of selective action and the law of displacement aided by the law of friction of mass. Under operation, the device is fed with dry ore, sand, grain or the like, the feed engaging a feed board where a preliminary rough separation is accomplished by a modified application of tapered riffles. The feed then engages the table deck at the head of its proper zone and here, because of the length and the great number of riffles, almost any desired number of carefully sized products may be taken off by placing receptacles at the bottom and far edges of the deck, from which falls, when in action, a constant sheet of granular material graded carefully from coarse particles to fine dust.

Mechanical sizing is applicable to every form of dry granular material such as crushed ore, salt, coal, sand, emery, cereals, unbroken or crushed, or, in fact, there is no field in dry sizing now filled by metallic screen devices that cannot be filled by a mechanical sizer and often with greater economy and efficiency. This is proved by the fact that metallic screens blind and lose their efficiency while the mechanical device cannot clog or blind and automatically cleans itself. Specific gravity has practically no effect upon mechanical sizing for the reason that granular particles of the same contour and volume, when placed upon an inclined plane, have the same displacement of their centres of gravity with the result that a particle of lead and a particle of sawdust of the same size and shape will discharge from the table at the same point, although the specific gravity of the one is many times that of the other.

MECHANICAL TERMS. Words, compound words and short phrases, having definite meanings other than those of ordinary usage and specifically applicable to the use of tools and other mechanical appliances; to the construction and operation of machines, and to the methods employed and the manipulations required in the working and manufacture of the various kinds of materials used and the articles employed for engineering, structural and other industrial purposes.

A great many of these terms have been in use from the very beginning of the present period of industrial and manufacturing development, and are satisfactorily employed at the present time according to their original significance; but the creative mechanical effort of the last 40 years has either developed or produced so great a variety of mechanical devices and machines that the mechanical terminology has been expanded to include a much greater number of terms, which are more or less familiar to every one excepting those by whom they are habitually used in the execution of the particular line of work to which they are applicable.

Furthermore, the specializing methods of modern manufacturing systems, involving the restricted use of special terms, has not only tended to develop a class of one-sided workmen who are unquestionably skilful in their special lines of work and deplorably poor if not absolutely deficient in all other lines; but, the use of such methods has tended to increase the ever-widening gulf which separates any one class of workmen from the rest, by eliminating the necessity of a mutual knowledge of the special terms used in allied processes, by the special classes of workmen employed therein.

At the present time the number of mechanical terms amounts to several thousands. Eliminating those of a more or less fanciful character, and also those employed in individual shops, the terms having definite meanings capable of universal or wide application probably exceed 12,000 in number, the great majority of which are employed in the metal manufacturing and metal working industries.

A superficial examination of this terminology conveys the impression that a definite classification of the various terms would be either impossible or quite difficult, but a closer inspection shows that they may be very conveniently divided into several general classes

according to the character of the work, machines and structures to which they are applicable, as follows: (1) Terms applicable to the processes and methods employed in the production of raw materials and rough work, and in the preparation of rough work for subsequent finishing operations; (2) terms applicable to the methods, processes and machines employed in the working of suitably prepared raw material into the form of simple articles, into the parts of complex machines and into structural shapes in general; (3) terms employed in the work connected with the preliminary and final erection of machines, engines and structures; (4) terms used for the purpose of describing special forms of mechanical appliances and mechanical movements according to their field of application; (5) terms employed in operating the various classes of engines and machines; (6) general terms employed in connection with the execution of mechanical and structural engineering work; and (7) terms employed in connection with the use of the tools and appliances, and the application of the various methods and processes, in the reproductive arts.

In considering the matter of the application of technical terminology it is well to prescribe marked lines of demarcation between the terms employed in connection with the different kinds of work, as for example — between the terms applicable to mechanical work and those employed in connection with electrical work. As a rule, the distinction is quite clear, but when the terms are used for the purpose of describing appliances, devices and apparatus the line of demarcation becomes somewhat indistinct, and the precise meanings of the terms require careful consideration.

One of the most interesting examples of the varied technical application of a common term is that afforded by the use of the word "damper." It is familiarly known as a plate, valve, cover or other suitable contrivance for regulating the amount of draught in the flues of a furnace or boiler. As a specific mechanical term it is applied to the "dash-pot" or small cylinder which forms a portion of the engines of the Corliss type, in which they act as a "buffer-case" and prevent the too sudden closing of the steam and exhaust valves. As an electrical term it is applied to a metallic cylinder which is placed in such a manner that it nearly or entirely encompasses the iron core of an induction coil for the purpose of effecting a variation in the intensity of the current produced in the secondary battery. As a term employed in musical construction and operation it is applied to the strip of felt or other soft material employed in a piano-forte for the purpose of modulating the vibration of the strings.

A more varied technical application obtains in the case of the common word "pitch." As used in connection with mechanical work it refers to the distance between the centres of two adjacent teeth on a gear-wheel, to the distances between bolts, rivets and boiler stays or similar parts arranged equidistantly. Also to the inclination or rake of the teeth of saws, to the angle at which a plane-iron is set on its stock and to the height or angle of a roof-truss. As an electrical term it refers to the successive corresponding conductors on the armature of a dynamo and the number of coils advanced in making end-connections between the coils of an armature winding divided into segments. It is also applied to designate the frequency of a tone vibration produced electrically. As a musical term it refers to a succession of tone vibrations.

The character of a technical term or the class of work to which it belongs is usually very clearly indicated by the textual matter on any particular subject, but in the case of mechanical and electrical terms when the distinction is not obvious, the special character of a term may be ascertained only by the nature of the power generated, controlled or applied.

MECHANICS (*μηχανή*, a machine), or DYNAMICS, the science that treats of forces (*δύναμις*, force), and of the motions produced by them. The notion of a force, as evinced to the senses as a push or pull, is common to all, but the notion of force as that which produces or destroys motion, which is the proper definition of force, is modern, and is to be ascribed to Newton, the chief founder of the science. It is a familiar fact that two opposite pushes or pulls may neutralize each other's effects, and thus fail to produce motion; we then speak of them as forces in *equilibrium*. The portion of Mechanics that treats of forces in equilibrium is denoted by the term *Statics* (root *στα*, stand), contrasted with which we have the subject of *Kinetics* (*κινέω*, to set moving), which deals with the effects of forces in acting to produce motion in bodies. Since we can distinguish motion only in matter, the laws of motion involve the essential properties of matter, so that Dynamics is a branch of Physics — indeed, its most fundamental branch, for, until recently, it was the effort of physicists to reduce all explanations of physical phenomena to descriptions of matter in motion.* Nowadays the tendency of interpreting mechanics in electromagnetic terms is making itself felt. As in geometry, instead of dealing with actual substance, we make abstraction and conceive of points, lines and surfaces apart from the substance in which they lie, so we may make abstraction and consider the motion of points, lines or geometrical configurations, quite apart from any matter or physical properties. This geometry of moving configurations or geometry of space and time is generally distinguished by the name of *Kinematics* (*κίνημα*, motion), and is included under treatments of Dynamics only for convenience, as it is impossible to make dynamical investigations except in kinematical terms.

The ancients knew but little of Mechanics, and what they did know belonged exclusively to Statics. Archimedes was familiar with the principles of the lever and of the pulley. Leonardo da Vinci generalized the principle of the lever, and Stevinus (1548–1620) demonstrated the principle of the inclined plane and of the composition of forces. Varignon clearly enunciated the principle of moments, and also of the

* *Utinam cætera naturæ phænomena ex principiis mechanicis eodem argumentandi genere derivare liceret.* Newton 'Preface to Principia.'

composition of forces. Galileo, in the course of his investigations on the inclined plane, came to a recognition of a particular case of the Principle of Virtual Work, which was made general by Daniel Bernoulli. These are the chief names in the development of Statics. The beginnings of Kinematics were made by Galileo, who determined the laws of falling bodies, and introduced the fundamental idea of acceleration. Huygens, in his 'Horologium Oscillatorium,' published in 1673, examined in detail the laws of the pendulum, introduced the ideas of moment of inertia, of the centre of oscillation and of kinetic energy. Most important of all was the work of Newton, who in his 'Principia Philosophiæ Naturalis' (1687), not only universalized the idea of force, and introduced the notion of *mass*, but laid down the exact definitions and principles from which it has never been necessary to depart. Since the work of Newton the chief names have been d'Alembert, Lagrange and Hamilton, who have given us methods of great generality and convenience, but without changing in any essential the principles laid down by Newton.

1. Statics.—Although the principles of Statics may be logically deduced from those of Kinetics by assuming all velocities to be zero, it is simpler to follow the historical method and treat statics first, since we may dispense with the idea of time, and thus with the preliminary study of kinematics. We begin by assuming the identical nature of all forces. For instance, the effect of any force may be neutralized by a pull on a string fastened to the point at which the force is applied. The tension on a string is produced by equal and opposite pulls on its two ends, and it may be cut anywhere, if at the cut end is applied a force equal to the one previously applied to the end. Such a force may be produced by the weight of any body hanging from the end of the string. But as a weight always acts vertically downward, while forces may act in any direction, we may suppose the string carried over a smooth pulley with horizontal axis, whose effect is assumed to be merely to change the direction of the string without changing its tension. Thus any force in any direction may be equilibrated by the tension of a string produced by a certain weight. Two forces are equal when they are equilibrated by the same weight. Two weights found to be equal (by equilibration), when hung from the same string, produce double the tension produced by one, and thus forces may be measured in terms of a single weight. A force having magnitude and direction may be geometrically represented by a line parallel to it, and of a length proportional to its magnitude. To this line an arrow-head may be attached to indicate the sense of the direction of

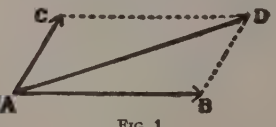

Fig. 1.

the force. We may now enunciate the principle, capable of experimental verification, that when two forces, represented by AB, AC, Fig. 1, are applied at the same material point A, they may be replaced by a single force whose direction and magnitude are represented by the diagonal AD of the parallelogram formed on the sides AB, AC. (The direction of the arrows must be observed). This is the principle of the *Parallelogram of Forces*. Obviously it may be replaced by the equivalent statement that if we form a triangle by placing at the extremity B of one or the lines representing the forces the initial point of the line representing the other force, BD, and complete the triangle, the line drawn from the initial point of the first to the terminal point of the second line will represent the *resultant* of the two forces, that being the term applied to the single force which replaces their effect. The original forces AB, AC, are said to be the *components* of AD. From the properties of the parallelogram, $AB \sin (BAD) = AC \sin (CAD)$, so that the magnitudes of the components are inversely proportional to the sines of the angles they make with the resultant. Obviously the two forces may be equilibrated by a force equal but opposite to the resultant, so that if we draw AE equal and opposite to AD (Fig. 2) the three

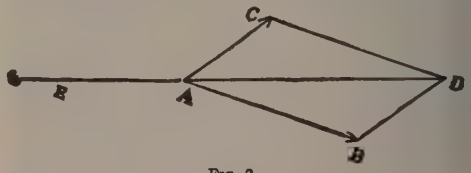

Fig. 2.

forces AB, AC, AE will be in equilibrium. As the angles BAD and BAE are supplementary, their sines are equal, similarly DAC and CAE; consequently we have $\frac{AB}{\sin (CAE)} = \frac{AC}{\sin (BAE)}$, and in turn considering each of the three forces as equilibrating the other two we get the theorem that the magnitudes of three forces in equilibrium are proportional to the sines of the angles lying opposite them respectively. This may be experimentally verified as in Fig. 3, where weights P, Q are hung

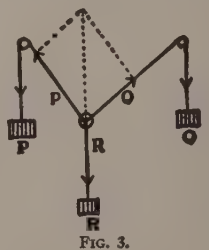

Fig. 3.

from strings passing over pulleys, and united at O to a string carrying a weight R. If a parallelogram be drawn on lengths proportional to P, Q, its diagonal will be vertical, and proportional to the weight R. A convenient form of the experiment is one in which the three strings are horizontal, and O is the centre of a horizontal circular table, on whose rim the three pulleys may be placed, their relative positions being read off on a graduation of the edge of the table.

Obviously, by a reversal of the previous process, a given force may be resolved into components in any two given directions, as only one parallelogram can be drawn on a given diagonal, whose sides have given directions. If these directions are at right angles to each

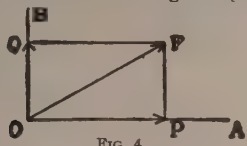

FIG. 4.

other, as in Fig. 4, OP is the *component* of OF in the direction OA and OQ the component in the direction perpendicular thereto. The length OP is called the *projection* of OF in the direction OA, and we have $OP = OF \cos (POF)$. Having found the resultant of two forces applied at a common point, we may compound this resultant with another force, and so on, the simplest rule of procedure being by an extension of the triangle method above, that is, apply the initial point of each line representing a force to the terminal point of the preceding line; then the line drawn from the first initial point to the last terminal point will represent the resultant. The slightest consideration will show that the resultant is independent of the order in which the forces are compounded. This construction is known as the polygon of forces (Fig. 5). It is ob-

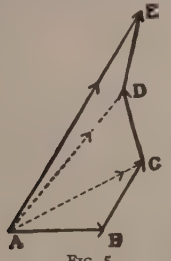

FIG. 5.

viously not restricted to forces lying in the same plane.

In order to deal analytically with the composition of forces, it is convenient to assume three rectangular axes of co-ordinates, OX, OY, OZ (Fig. 6), and to resolve every force

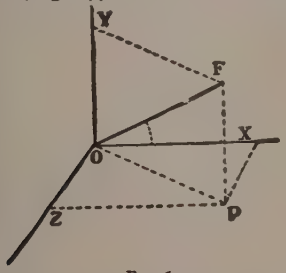

FIG. 6.

into three components along each. Thus OF may be resolved into the mutually perpendicular components OY and OP, and OP may be resolved into OX and OZ. Calling the resultant F, the components respectively X, Y, Z, we have

$$(1)\qquad \begin{aligned} X &= F\cos(Fx),\\ Y &= F\cos(Fy),\\ Z &= F\cos(Fz); \end{aligned}$$

$$(2)\qquad X^2+Y^2+Z^2 = F^2[\cos^2(Fx)+\cos^2(Fy)+\cos^2(Fz)] = F^2,$$

since the sum of the squares of the direction cosines of any line is identically equal to unity. Since the projection in any direction of any broken line is the same as that of a straight line with the same ends, it is evident that the projection of any resultant is the same as the algebraic sum of the projections of all its components. Thus the analytical expression of the principle of the parallelogram or polygon of forces is, if F is the resultant, X, Y, Z its components along the axes,

$$(3)\qquad \begin{aligned} X &= X_1+X_2+\ldots X_n = \Sigma X,\\ Y &= Y_1+Y_2+\ldots Y_n = \Sigma Y,\\ Z &= Z_1+Z_2+\ldots Z_n = \Sigma Z. \end{aligned}$$

Any geometrical or physical quantity which possesses direction as well as magnitude, and is compounded according to the parallelogram law, and to which the whole of the above exposition applies, is called a *vector*, and the preceding process is called the *composition of vectors*.

2. A body so small that we may neglect the differences of position of its different points is called a *material particle*. The only principle necessary for the treatment of forces acting on such a particle is that for equilibrium the resultant of all the forces applied to it must vanish. The particle may be free or it may be subject to certain geometrical constraints, for instance, it may be obliged to move on a certain surface. Then there will be certain forces acting between the particle and the bodies causing the constraint, these forces being known as *reactions* due to the constraint. A surface is said to be smooth if the reaction between it and a particle at rest is normal to the surface. Thus let F, Fig. 7, represent a

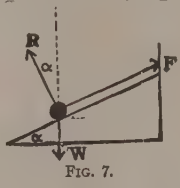

FIG. 7.

force applied to a particle of weight W, resting on an inclined plane making an angle α with the horizontal. Let F be parallel to the inclined plane. Then the three forces, W. F. and R, the reaction, normal to the plane, are in equilibrium. Writing these proportional to the opposite angles, as above, we obtain

$$(4)\qquad \frac{F}{\sin\alpha} = \frac{R}{\cos\alpha} = \frac{W}{1},$$

which determine F and R in terms of W. The same equations are obtained by resolving in the direction of the tangent and of the normal to the plane. The equation $F = W \sin\alpha$ shows that the force required to sustain a particle on a smooth plane is to the weight of the particle in the same ratio as the height of the plane to its length, as was shown by Stevinus and Galileo.

In the problem just treated, it is evident that the resultant of the applied forces W and F is opposite to R, that is, is normal to the plane. Similarly for equilibrium on any smooth surface, it is necessary that the resultant of all the applied forces shall be normal to the surface, for if it had any component parallel to the tangent plane this component would move the particle along the surface. Since the particle is constrained to move on a surface, there will be a relation between x, y, z, the co-ordinates of the particles, $\phi(x, y, z) = 0$, which is the equation of the surface; and since the direction cosines of the normal n are given by the equations

$$\cos(nx) : \cos(ny) : \cos(nz) = \frac{\partial\phi}{\partial x} \cdot \frac{\partial\phi}{\partial y} \cdot \frac{\partial\phi}{\partial z},$$

if X, Y, Z are the components of the resultant of the applied forces, we have as the condition for equilibrium

$$\cos(Fx) = \frac{X}{F} = \cos(nx), \text{ etc.,}$$

or

$$\frac{X}{\frac{\partial\phi}{\partial x}} = \frac{Y}{\frac{\partial\phi}{\partial y}} = \frac{Z}{\frac{\partial\phi}{\partial z}}. \tag{5}$$

If the surface is not smooth, the reaction between the particle and the surface is not normal, but there is a tangential component which is called *friction*. The force of friction is peculiar in that it cannot produce but only hinder motion, and in having its direction determined as opposite to the direction in which the other forces tend to make the particle move. The law usually assumed governing friction is that when motion is just about to take place the friction, or tangential component of the reaction, is proportional to the normal component, the factor of proportionality being a constant for two given substances, such as those composing the particle and plane, as above. Suppose that in the problem of the inclined plane the force F is the force of friction. Then we have $F = \mu R$, where μ is a constant for the given particle and plane called the coefficient of friction. Equations (4) then give

$$F = R \tan \alpha = \mu R, \quad \mu = \tan \alpha,$$

when the particle is just about to slide down. If the plane is any steeper than the value of α thus given, equilibrium is not possible. This angle is called the *angle of friction*.

3. Let us now consider a *rigid* body, that is, one composed of a continuous distribution of matter having the property that the distance between any two of its points is invariable, no matter to what forces it is subjected. It is evident that if equal and opposite forces, P and Q, Fig. 8, be applied to such a body at

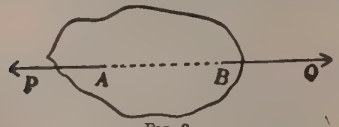

Fig. 8.

two points A and B such that the line AB has the direction of the forces, no motion will be produced, for reasons of symmetry with respect to AB. Equilibrium is also independent of the position of B on the line AB. Consequently the force Q might be applied at A, where it might be compounded with P, giving a vanishing resultant. The principle that any force applied to a rigid body may be considered as applied at any other point in its line of direction is known as that of the *transmissibility of force*. As an application, if the lines of direction of three forces, P, Q, R (Fig. 9), intersect in a common point O, they

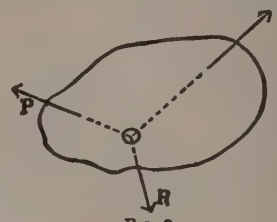

Fig. 9.

may be transferred to that point, and if they satisfy the conditions for the equilibrium of forces applied to a material particle, they will produce equilibrium of the rigid body.

Suppose we have two parallel forces P and Q applied at any points A, B, of a rigid body, (Fig. 10). If we apply at A and B any two

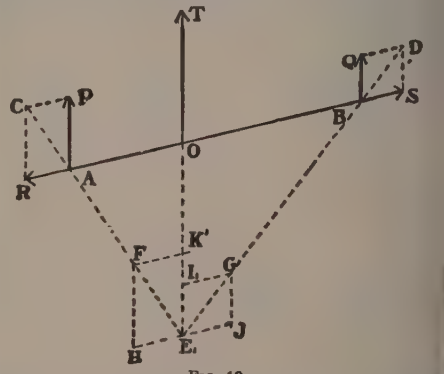

Fig. 10.

equal and opposite forces AR, BS, in the direction of AB, equilibrium will not be affected. Compound these respectively with AP, BQ, and transfer the resultants AC, BD, to the intersection of their lines of direction E and there resolve them into components in the original directions. From the equality of the parallelograms $EKFH$ and $APCR$, $ELGJ$ and $BQDS$, the components EJ and EH are equal and opposite, so that there remain only the components EK and EL, in the same direction, equal to the given forces AP, BQ, respectively. Thus the resultant of two parallel forces in the same direction applied to a rigid body is a force in the same direction equal to their sum. Obviously it may be considered as applied at any point O in the line EK. Suppose O to lie on AB. By similar triangles $\frac{AP}{AR} = \frac{OE}{AO}$, $\frac{BQ}{BS} = \frac{OE}{BO}$, and by division, since $AR = BS$, $\frac{AP}{BQ} = \frac{BO}{AO}$. Thus the distance of the intersection of the line of direction of the re-

sultant with AB from A and B is inversely proportional to the forces applied at those points. This is the principle of the lever, as known to Archimedes.

If the forces P and Q are the weights w_1, w_2, of two particles, placed at AB, the point O is called the *centre of gravity* of the two particles. It is also called the weighted mean point of points AB with the weights w_1, w_2. If we project the points A, B, O upon the co-ordinate axes, the projections of AO, BO, are in the same ratios as the lengths themselves; consequently if their co-ordinates are respectively $x_1, y_1, z_1, x_2, y_2, z_2, \bar{x}, \bar{y}, \bar{z}$,

$$\frac{\bar{x}-x_1}{x_2-\bar{x}}=\frac{\bar{y}-y_1}{y_2-\bar{y}}=\frac{\bar{z}-z_1}{z_2-\bar{z}}=\frac{m_2}{m_1},$$

or

$$(6)\qquad \bar{x}=\frac{m_1x_1+m_2x_2}{m_1+m_2},\ \bar{y}=\frac{m_1y_1+m_2y_2}{m_1+m_2},$$

$$\bar{z}=\frac{m_1z_1+m_2z_2}{m_1+m_2}.$$

By a generalization, we obtain for the centre of gravity of any number of points, or the resultant of any number of parallel forces,

$$(7)\qquad \bar{x}=\frac{\Sigma mx}{\Sigma m},\ \bar{y}=\frac{\Sigma my}{\Sigma m},\ \bar{z}=\frac{\Sigma mz}{\Sigma m}.$$

If the two forces AP, BQ, are in opposite directions, instead of Fig. 10 we have the construction of Fig. 11, and the resultant is evi-

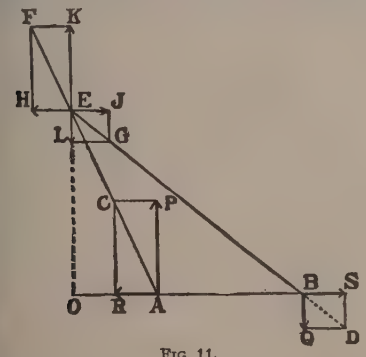

FIG. 11.

dently equal to the *difference* of the two components, while the point O lies outside the segment AB. We may say that in general the resultant is equal to the *algebraic* sum of the components. In Fig. 11, if AP and BQ are made more nearly equal, the point O recedes to a greater distance, and in the case of equality, when we have AC parallel to BD, O must be infinitely distant. The same result is given by the formulæ (6), putting $m_1+m_2=0$. In other words, two equal, parallel and *oppositely* directed forces applied to a rigid body cannot be replaced by a single resultant. Such a pair of forces is called a *couple*. The perpendicular distance between the two lines of direction of the members of the couple is called its *arm*. The product of the magnitude of either force by the arm of the couple is called the *moment* of the couple. The plane of the couple is the plane containing both forces. We have shown that a couple cannot be equilibrated by any single force, but it may be by another couple. This couple may be chosen in an infinite variety of ways. It may easily be shown by drawing the members of the second couple as about to be prescribed, and compounding the forces two and two, by the rules already given, that the equilibrating couple may be equilibrated by any of the following, and that the given couple may accordingly be replaced by: 1° An equal and parallel couple in any plane parallel to its own; 2° An equal couple in its plane turned about its point of symmetry; 3° A couple in the same place having different arm and forces but the same moment. Thus all that characterizes a couple is the magnitude of its moment and the direction of the normal to the plane of the couple. The couple then behaves like a directed quantity, and may be symbolized by a line in the direction of the normal to its plane, whose length gives the magnitude of the moment. That couples are also compounded by the vector law is easily seen, for consider for forces of the two couples to be applied at two points AB in the line of intersection of their two planes. This can be done by bringing the couples to have the same arm. Let P_1 P_2 (Fig. 12) be the members of one couple, Q_1Q_2 those

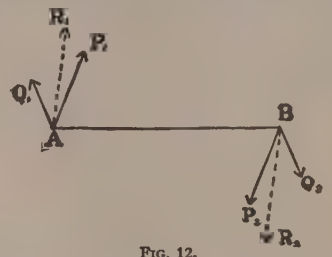

FIG. 12.

of the other. Compound P_1Q_1 by the parallelogram law to R_1, P_2Q_2 to R_2. These being equal, parallel and oppositely directed, form a couple which, having the same arm as the original couples, has its moment proportional to R, that is, found by the parallelogram construction. If lines are laid off perpendicular to the three planes of AB and P, Q, R, respectively, and proportional to the three moments, they will also follow the parallelogram law. Thus a couple may be represented by a vector perpendicular to its plane. This vector we shall speak of as *the couple*, and shall disregard the resolution into two separate forces.

Let us now consider the effect of any number of forces applied at various points of a rigid body. At any point O (Fig. 13) apply two equal and opposite forces $P'P''$ equal and parallel to a force P applied at A. We thus have the force P' equal to P applied at O instead of at A, together with the couple PP''. Similarly all the forces applied at other points may be considered applied at O, by introducing in each case a couple. All the forces at O may be compounded into a single resultant, and all the couples into a single couple. Thus the resultant of any number of forces applied to a rigid body is a single force together with a single couple. Evidently the resultant force does not depend upon the position of the

point O, while the resultant couple does. In order to have equilibrium, both the resultant force and the resultant couple must vanish.

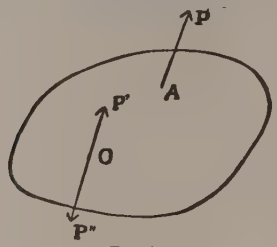

FIG. 13.

In order to express these conditions analytically, we must find an expression for the moment of a vector about a given point, that is, the product of the magnitude of the vector by the length of the perpendicular dropped upon it from the given point. This moment is thus numerically equal to the area of the parallelogram formed with the given point as one corner and the given vector as one side. As plane areas may be projected on other planes by multiplying by the cosine of the dihedral angle between them, which is equal to the angle between their normals, it is evident that the area of the parallelogram, and hence the moment, may be represented by a vector perpendicular to its plane, as already shown for the moment of a couple. Thus it is only necessary to find expressions for the three projections of a moment. Let the vector F (Fig. 14), with components X, Y, be applied at a point having the co-ordinates x, y. Its moment about the origin is equal to the area of a parallelogram having as adjacent sides lines drawn from the origin to points x, y and X, Y. This area is equal to $xY-yX$. But this is the projection in the XY-plane of the area of the parallelogram on the lines from O to points x, y, z, and X, Y, Z. It therefore represents the Z-component of the required moment. Similarly the three components are obtained.

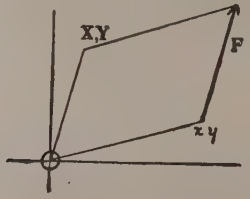

FIG. 14.

(8) $L=yZ-zY, \quad M=zX-xZ, \quad N=xY-yX.$

The moment of a couple is the sum of the moments of its two members, and if X, Y is applied at x_1, y_1,—X,—Y at x_2, y_2, we obtain for the moment of the couple

$$x_1Y-y_1X-x_2Y+y_2X=(x_1-x_2)Y-(y_1-y_2)X,$$

which evidently does not depend on the choice of the origin, but only on the vector F and the *relative* position of the two points of application, since only differences of x_1x_2, y_1y_2 appear.

The analytical statement of the conditions for equilibrium of a rigid body is then

(9) $$\Sigma X=0, \quad \Sigma Y=0, \quad \Sigma Z=0;$$
$$\Sigma(yZ-zY)=0, \quad \Sigma(zX-xZ)=0,$$
$$\Sigma(xY-yX)=0,$$

the first three expressing the vanishing of the resultant force, the last three the vanishing of the resultant couple. These principles suffice for the treatment of all problems concerning the equilibrium of a rigid body. For example, the extended principle of the lever follows from the theory of moments. Consider now the problem of a ladder standing on a smooth floor and leaning against a smooth wall (Fig. 15). The resultant of the weights

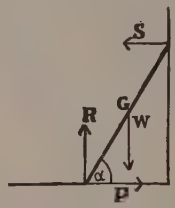

FIG. 15.

of all the parts of the ladder is a single force W applied at the centre of gravity G. Besides this we have to consider the normal reactions R and S. Resolving vertically we find for equilibrium $W-R=0$. Resolving horizontally there must be a force to balance S. Let this be P, applied at the lower end of the ladder. Then $P-S=0$. This does not determine the value of P or S, but we may do this by taking moments about any point in the plane of the figure. If we choose the lower end of the ladder, P and R will have zero moment, and if l is the length of the ladder, α the inclination,

$$Sl \sin \alpha-(Wl \cos \alpha)/2=0, \quad S=\tfrac{1}{2}W\cot \alpha.$$

If the floor is rough, and P the friction, $P=\mu R=\mu W=S=\frac{1}{2}W\cot \alpha$, $\mu=\frac{1}{2}\cot \alpha$, and if α is less than the angle determined by this equation, the ladder will slip down.

4. All the principles of statics are comprised in the Principle of Virtual Work. The conception of work is equally important with that of force. Work is done when the point of application of a force moves, the amount of work being defined as the product of the magnitudes of the force and the distance moved by the cosine of the angle included by them. If F denote the force, D the displacement, the work is $FD \cos (FD)$. This *geometric* or *scalar product* of two vectors (not a vector, since it is not associated with direction, but merely with a number, or scalar) defined as the product of either by the projection on it of the other, is of much importance in our whole subject. The cosine of the angle between two directions is given by the symmetric function of their direction cosines

$$\cos (FD)=\cos (Fx) \cos (Dx)$$
$$+\cos (Fy) \cos (Dy)+\cos (Fz) \cos (Dz).$$

Now if the projections on the axes of co-ordinates of the two vectors are

(10) $$F_x=F \cos (Fx), \quad F_y=F \cos (Fy),$$
$$F_z=F \cos (Fz),$$
$$D_x=D \cos (Dx), \quad D_y=D \cos (Dy),$$
$$D_z=D \cos (Dz),$$

we have

(11) $$FD \cos (FD)=F_xD_x+F_yD_y+F_zD_z$$

as the analytic expression for the scalar product. If one of the vectors is taken as of unit length,

the expression (11) gives us the value of the projection F_s of any vector F on any direction s,

$$(12)\quad F_s = F\cos(Fs) = F_x\cos(sx) + F_y\cos(sy) + F_z\cos(sz).$$

It is easily proved that the work of the resultant of two forces in a displacement is the sum of the works of the components.

In the case of an infinitely small displacement dx, dy, dz, the work is

$$(13)\quad dW = F_x dx + F_y dy + F_z dz,$$

and if the point is moved along a curve the whole work is

$$(14)\quad W = \int (F_x dx + F_y dy + F_z dz),$$

where x, y, z, F_x, F_y, F_z, are supposed given in terms of some parameter, so that the integration along the curve can be performed.

If some of the points of a system are not free, but constrained, a *virtual* displacement is one that is consistent with the constraints. Virtual work is work done in a virtual displacement. The *Principle of Virtual Work* states that in a system of forces in equilibrium the work done in an infinitesimal *arbitrary* virtual displacement vanishes. Let us apply this principle to a number of simple cases. First, two equal weights P hanging from a string over a fixed pulley are in equilibrium. If the system is displaced one weight falls as much as the other rises. For the one that falls the displacement is in the direction of the force, and the work is positive and equal to PD. For the one that rises the displacement is opposite to the direction of the force, and the work is negative and equal to $-PD$. The sum of these two quantities thus vanishes. In the case of a weight hanging from a movable pulley (Fig. 16), if the string on the left is

FIG. 16.

pulled up a distance D, the force T_1 does the positive work T_1D; but from the geometry of the case the weight P rises a distance of $D/2$ and the weight W accordingly does the negative work—$PD/2$. The whole work is zero, if $T=P/2$. But this is the condition of equilibrium as found by resolution, since the tensions T_1 and T_2 are equal and we must have $T_1+T_2-P=0$. Consider a lever (Fig. 17)

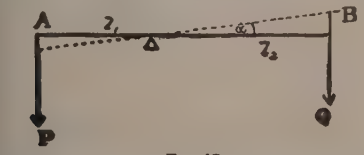

FIG. 17.

carrying the weights P, Q at distances l_1, l_2 from the fulcrum. Then for equilibrium the principle of moments gives $Pl_1=Ql_2$. But if the lever be turned through an infinitesimal angle α, the end A moves a distance downward $D_1=l_1\alpha$ and the weight does the positive work $Pl_1\alpha$, while the end B rises a distance $D_2=l_2\alpha$, and Q does the negative work $-Ql_2\alpha$. The whole work is zero if $Pl_1=Ql_2$, which is the condition for equilibrum. In the case of the inclined plane (Fig. 7), if the particle is displaced a small distance d up the plane, the force F does the work Fd. The weight W does the negative work $-Wd\sin\alpha$, since its direction makes an obtuse angle with the displacement. The reaction does no work, since it is perpendicular to the displacement. The whole work is therefore zero if $F=W\sin\alpha$. But this is the condition of equilibrium. The principle of virtual work is particularly convenient, since it enables us to leave the reactions out of account, since they do no work when the displacements are virtual. As a further example let us consider the equilibrium of a particle whose co-ordinates are x, y, z on a surface $\phi(x, y, z)=0$, under the action of forces whose resultant is X, Y, Z, omitting the reaction. Since the displacement is virtual, we must have $\phi=0$ during the displacement, so that

$$(15)\quad d\phi = \frac{\partial\phi}{\partial x}dx + \frac{\partial\phi}{\partial y}dy + \frac{\partial\phi}{\partial z}dz = 0.$$

The principle of virtual work says that for equilibrium

$$(16)\quad X dx + Y dy + Z dz = 0$$

for any virtual displacement, that is, one in which dx, dy, dz are not independent, but satisfy (15). Multiplying (15) by an undetermined factor λ and adding to (16), we have

$$(17)\quad \left(X+\lambda\frac{\partial\phi}{\partial x}\right)dx + \left(Y+\lambda\frac{\partial\phi}{\partial y}\right)dy + \left(Z+\lambda\frac{\partial\phi}{\partial z}\right)dz = 0.$$

Both conditions are satisfied if we determine λ so that

$$(18)\quad X+\lambda\frac{\partial\phi}{\partial x} = Y+\lambda\frac{\partial\phi}{\partial y} = Z+\lambda\frac{\partial\phi}{\partial z} = 0,$$

or eliminating λ,

$$(19)\quad \frac{X}{\frac{\partial\phi}{\partial x}} = \frac{Y}{\frac{\partial\phi}{\partial y}} = \frac{Z}{\frac{\partial\phi}{\partial z}}.$$

But this is the condition (5) that the resultant is normal to the surface, and in fact only in this way can there be equilibrium, according to the definition of a smooth surface.

For a rigid body, a possible displacement is one in which all the points receive equal and parallel displacements, so that dx, dy, dz are the same for all. We then have

$$(20)\quad \Sigma(X dx + Y dy + Z dz) = dx\Sigma X + dy\Sigma Y + dz\Sigma Z = 0.$$

If this is to be true for arbitrary values of dx, dy, dz we must have

$$\Sigma X = \Sigma Y = \Sigma Z = 0, \tag{21}$$

which are three of the conditions for equilibrium already found. A second possible displacement of a rigid body is one in which it is turned through an angle $d\theta$ about the Z-axis. Let us introduce polar co-ordinates, so that

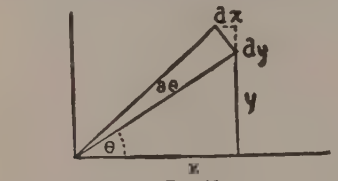

FIG. 18.

$x = r\cos\theta$, $y = r\sin\theta$. Then in the rotation, r being constant,

$$dx = -r\sin\theta\, d\theta = -y\, d\theta,\ dy = r\cos\theta\, d\theta = x\, d\theta,\ dz = 0.$$

Consequently the virtual work is

$$\Sigma(X dx + Y dy + Z dz) = d\theta\,\Sigma(xY - yX). \tag{22}$$

If this is to vanish whatever $d\theta$ we must have

$$\Sigma(xY - yX) = 0. \tag{23}$$

But this is one of the conditions for equilibrium (9) already found, and the two others are similarly found by rotating about the other axes.

Suppose now that we have any number of points $x_1, y_1, z_1, \ldots x_n, y_n, z_n$, acted on by any forces, $X_1, Y_1, Z_1, \ldots X_n, Y_n, Z_n$, and subject to any number of constraints,

$$\begin{aligned} &\phi_1(x_1, y_1, z_1, \ldots x_n, y_n, z_n) = 0, \\ &\phi_2(x_1, y_1, z_1, \ldots x_n, y_n, z_n) = 0, \\ &\quad\ldots\ldots\ldots\ldots\ldots\ldots \\ &\phi_k(x_1, y_1, z_1, \ldots x_n, y_n, z_n) = 0. \end{aligned} \tag{24}$$

Then the equation of virtual work,

$$\sum_{r=1}^{r=n} (X_r dx_r + Y_r dy_r + Z_r dz_r) = 0, \tag{25}$$

must hold for any changes of the co-ordinates which satisfy the conditions,

$$d\phi_1 = \sum_{r=1}^{r=n} \left(\frac{\partial\phi_1}{\partial x_r} dx_r + \frac{\partial\phi_1}{\partial y_r} dy_r + \frac{\partial\phi_1}{\partial z_r} dz_r \right) = 0.$$

$$\ldots\ldots\ldots\ldots \tag{26}$$

$$d\phi_k = \sum_{r=1}^{r=n} \left(\frac{\partial\phi_k}{\partial x_r} dx_r + \frac{\partial\phi_k}{\partial y_r} dy_r + \frac{\partial\phi_k}{\partial z_r} dz_r \right) = 0.$$

Multiplying these equations in turn by multipliers $\lambda_1, \ldots \lambda_k$, and adding to (25),

$$\begin{aligned} \sum_{r=1}^{r=n} \Bigg[&\left(X_r + \sum_{s=1}^{s=k} \lambda_s \frac{\partial\phi_s}{\partial x_r} \right) dx_r \\ &+ \left(Y_r + \sum_{s=1}^{s=k} \lambda_s \frac{\partial\phi_s}{\partial y_r} \right) dy_r \\ &+ \left(Z_r + \sum_{s=1}^{s=k} \lambda_s \frac{\partial\phi_s}{\partial z_r} \right) dz_r \Bigg] = 0, \end{aligned} \tag{27}$$

which is satisfied for all virtual values of $dx_1, \ldots dz_n$, if we take

$$\begin{aligned} X_r + \sum_{s=1}^{s=k} \lambda_s \frac{\partial\phi_s}{\partial x_r} &= 0, \\ Y_r + \sum_{s=1}^{s=k} \lambda_s \frac{\partial\phi_s}{\partial y_r} &= 0, \quad r = 1, 2, \ldots n. \\ Z_r + \sum_{s=1}^{s=k} \lambda_s \frac{\partial\phi_s}{\partial z_r} &= 0. \end{aligned} \tag{28}$$

From these equations, eliminating the k multipliers $\lambda_1, \ldots \lambda_k$, we have $3n - k$ equations of equilibrium.

5. KINEMATICS.— Let us now consider questions of motion. The velocity of a point is defined as the limit of the space Δs described by it to the time of description Δt, when both decrease indefinitely.

$$v = \lim_{\Delta t = 0} \frac{\Delta s}{\Delta t} = \frac{ds}{dt}. \tag{29}$$

Since displacements are compounded as vectors, the resultant of a displacement AB (Fig. 1), and another BD being AD, if the two displacements take place in the same time, the velocities are also proportional to the three lines, so that velocities are vectors, compounded by the parallelogram. Accordingly a velocity may be represented by its components along the co-ordinates axes. Its direction being that of the tangent to the path, its direction cosines are those of the tangent,

$$\frac{dx}{ds}, \quad \frac{dy}{ds}, \quad \frac{dz}{ds}.$$

Consequently, its components are

$$v_x = v\frac{dx}{ds} = \frac{ds}{dt}\frac{dx}{ds} = \frac{dx}{dt}, \tag{30}$$

$$v_y = v\frac{dy}{ds} = \frac{ds}{dt}\frac{dy}{ds} = \frac{dy}{dt}, \quad v_z = v\frac{dz}{ds} = \frac{ds}{dt}\frac{dz}{ds} = \frac{dz}{dt}.$$

Also,

$$\begin{aligned} v^2 &= v_x^2 + v_y^2 + v_z^2 \\ &= \left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2 = \left(\frac{ds}{dt}\right)^2. \end{aligned} \tag{31}$$

Similarly, the projection of a velocity in any direction is the velocity of the projection of the point on a line having that direction.

If a point moves in a plane it may be convenient to introduce polar co-ordinates r, ϕ.

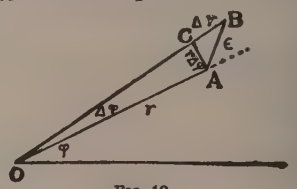

FIG. 19.

If the point moves from A to B (Fig. 19), a distance Δs in the time Δt, dropping a perpendicular AC upon the radius OB, the displace-

ment may be resolved into AC and CD, equal to $r\Delta\phi$ and Δr respectively, and accordingly the velocity may be resolved into the components in those directions.

$$(32) \qquad v_\phi = \lim_{\Delta t=0} \frac{r\Delta\phi}{\Delta t} = r\frac{d\phi}{dt},\ v_r = \lim_{\Delta t=0} \frac{\Delta r}{\Delta t} = \frac{dr}{dt}.$$

Also,

$$(33) \qquad v^2 = v_\phi^2 + v_r^2 = r^2\left(\frac{d\phi}{dt}\right)^2 + \left(\frac{dr}{dt}\right)^2 = \left(\frac{ds}{dt}\right)^2,$$

as may also be seen from the expression for the arc in polar co-ordinates. The components v_r and v_ϕ are called the radial and tangential components of the velocity respectively, while $\frac{d\phi}{dt}$ is called the angular velocity of the radius.

The area of the triangle OAB being $\frac{1}{2}r^2d\phi$, the radius vector sweeps over area at the rate $\frac{dS}{dt} = \frac{1}{2}r^2\frac{d\phi}{dt}$, but since the area is also equal to one-half the product of AB by the perpendicular on it from O, then we find this rate of area description to be equal to one-half the *moment of the velocity* about O. Using the formula (8) for moment of a vector we have

$$(34) \qquad \frac{dS}{dt} = \frac{1}{2}r^2\frac{d\phi}{dt} = \frac{1}{2}(xv_y - yv_x) = \frac{1}{2}\left(x\frac{dy}{dt} - y\frac{dx}{dt}\right),$$

which may be easily verified by passing directly from rectangular to polar co-ordinates.

6. If the velocity of a point varies we define the *acceleration* as the limit of the increment of velocity to the time in which it takes place. We may consider the numerical change,

$$(35) \qquad \lim_{\Delta t=0} \frac{\Delta v}{\Delta t} = \frac{dv}{dt} = \frac{d^2s}{dt^2},$$

or the vector change. If AB (Fig. 20) denote the velocity at a time t, AC the velocity at

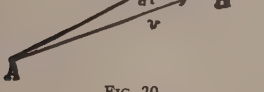

FIG. 20.

the time $t+\Delta t$, the vector increase of velocity is BC, and the acceleration is the limit of the ratio of BC to Δt. Obviously it may be resolved into any components, which are the corresponding components of BC each divided by Δt. In the triangle ABC, since the velocities AB and AC have the directions of the tangents to the path at the respective instants the angle between them is the angle $d\tau$ between the two consecutive tangents. It is obvious that the direction of the infinitesimal side BC may be anything whatever, and that accordingly the direction of the acceleration is totally unrelated to that of the velocity, that is of the tangent to the path. Resolving along the axes, we find for the components of the accelerations

$$(36) \qquad a_x = \frac{dv_x}{dt} = \frac{d^2x}{dt^2},\ a_y = \frac{dv_y}{dt} = \frac{d^2y}{dt^2},$$

$$a_z = \frac{dv_z}{dt} = \frac{d^2z}{dt^2},$$

from which

$$(37) \qquad a^2 = \left(\frac{d^2x}{dt^2}\right)^2 + \left(\frac{d^2y}{dt^2}\right)^2 + \left(\frac{d^2z}{dt^2}\right)^2.$$

Since the direction cosines of the tangent are the same as those of the velocity, v_x/v, v_y/v, v_z/v, we may use the formula (12) to resolve the acceleration along the tangent.

$$(38) \qquad a_\tau = (a_xv_x + a_yv_y + a_zv_z)/v$$

$$= \left(\frac{d^2x}{dt^2}\frac{dx}{dt} + \frac{d^2y}{dt^2}\frac{dy}{dt} + \frac{d^2z}{dt^2}\frac{dz}{dt}\right) \Big/ \frac{ds}{dt}$$

But differentiating equation (31) and comparing with (38), we find

$$(39) \qquad a_\tau = \frac{d^2s}{dt^2}.$$

Thus the rate of increase of the numerical velocity is equal, not to the whole acceleration, but to its tangential component. This we call the tangential acceleration, and it is equal to the limit of DC (Fig. 20), divided by Δt. The normal acceleration is easily obtained from the figure as the limit of BD divided by Δt. But in the figure we have $BD = AB \cdot d\tau = vd\tau$, so that the normal acceleration,

$$(40) \qquad a_\nu = v\frac{d\tau}{dt}.$$

Also, if ρ is the radius of curvature of the path, $ds = \rho d\tau$.

$$(41) \qquad a_\nu = \frac{v}{\rho}\frac{ds}{dt} = \frac{v^2}{\rho}.$$

The normal acceleration is always directed toward the *concave* side of the path, and is called the *centripetal acceleration.*

We will now consider some of the most important cases of acceleration. If the motion is rectilinear, the velocity and the acceleration have always the same direction, but may vary in magnitude and in sign. After uniform motion, in which the velocity is constant and the acceleration zero, so that equal spaces are described in equal times, the simplest case is that of constant acceleration,

$$(42) \qquad \frac{d^2s}{dt^2} = a = \text{const.}$$

Integrating we obtain

$$(43) \qquad \frac{ds}{dt} = at + b,$$

where b is a constant representing the velocity when $t=0$. Integrating again,

$$(44) \qquad s = \tfrac{1}{2}at^2 + bt,$$

where s denotes the space described since $t=0$. Thus if the particle start from rest ($b=0$), it describes spaces proportional to the *squares* of the times of description. It was found by Galileo that bodies fall toward the earth according to such a law, and that in a given locality the value of the acceleration is the same for all bodies. The value of this acceleration of gravity is generally denoted by g. Comparing the velocity attained by a body

falling from rest with the height, we obtain, by (43) and (44),

$$(45) \qquad v = gt,\ h = \tfrac{1}{2}gt^2,\ v^2 = 2gh.$$

Conversely, if a body be thrown upwards with a velocity v, it will reach the height h.

If we consider the motion of a body under gravity, but possessing a horizontal velocity as well as a vertical component, since there is no horizontal acceleration the horizontal velocity v_x is constant. Calling the vertical distance fallen z, the horizontal distance traversed x, we have

$$z = \tfrac{1}{2}gt^2,\ x = v_x t,$$

and eliminating t we have the equation of the path, $z = \frac{1}{2}\frac{gx^2}{v_x^2}$, representing a parabola with the axis vertical. The velocity at any point and its inclination to the horizontal are found from

$$v_z = gt = \sqrt{2gz},\ v^2 = v_x^2 + v_z^2,\ \tan\alpha = v_z/v_x.$$

If, on the other hand, the particle be projected upward with velocity v at an angle α with the horizontal, it will describe the same parabola, rising to the vertex in the time t and falling on the symmetrical half. This problem was also solved by Galileo.

Consider a particle revolving with constant velocity v in a circular path of radius r. Then since $s = vt$, by (39) we find that the tangential component of the acceleration vanishes. The normal component is given by (41) as v^2/r. Thus the acceleration is constant in amount and always directed toward the centre. It is to be observed that although the numerical velocity is constant, the vector velocity is constantly changing its direction, hence the acceleration is not zero, but is perpendicular to the velocity. If we resolve the uniform circular motion into components parallel to given directions, for instance, if P (Fig. 21) is projected into Q and R lying on the axes OX, OY, and if P revolves with constant angular velocity $\omega = \frac{d\phi}{dt}$, we have $\phi = \omega t$, $OQ = r\cos\phi = r\cos\omega t$, $OR = r\sin\phi = r\sin\omega t$. The rectilinear motion of either Q or R is called *simple harmonic motion*, or a *simple vibration*. It is evidently periodic, that is, it repeats after the interval $T = \frac{2\pi}{\omega}$. The number of vibrations in unit of time, or the *frequency*, is $\frac{1}{T} = \frac{\omega}{2\pi}$. Since the acceleration of P is constant in magnitude,

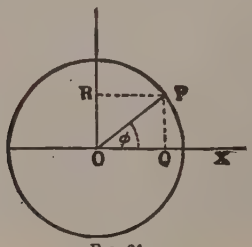

Fig. 21.

and always in the direction PO, its component along OX varies as $\cos\phi$, that is, as the distance OQ. In other words, a point describing a simple harmonic motion has an acceleration proportional to its displacement from the centre of symmetry, and directed toward it. We may also consider harmonic motion analytically. If the acceleration is proportional to the displacement but opposite in direction, we shall have

$$(46) \qquad \frac{d^2s}{dt^2} = -\omega^2 s,$$

where ω is a constant. The integral of this differential equation is

$$(47) \quad s = A\cos\omega t + B\sin\omega t = a\cos(\omega t - \alpha),$$

where A and B are arbitrary constants and $A = a\cos\alpha$, $B = a\sin\alpha$. The constant a is called the *amplitude*, while the angle α, called the *phase*, depends simply upon the instant adopted from which to count the time. By taking for α the values 0° or 90° we obtain either $a\cos\omega t$ or $a\sin\omega t$.

If we compound two simple harmonic motions in lines at right angles to each other, if the amplitudes and periods are the same and the phases differ by a right angle, the previous construction shows that we obtain uniform circular motion. If the amplitudes and phases do not have this relation, we have

$$(48) \qquad \begin{aligned} x &= a\sin(\omega t - \alpha) \\ &= a(\sin\omega t\cos\alpha - \cos\omega t\sin\alpha), \\ y &= b\sin(\omega t - \beta) \\ &= b(\sin\omega t\cos\beta - \cos\omega t\sin\beta). \end{aligned}$$

Solving for $\sin\omega t$ and $\cos\omega t$

$$(49) \quad \sin\omega t = \left(\frac{x}{a}\sin\beta - \frac{y}{b}\sin\alpha\right)\Big/\sin(\beta-\alpha),$$

$$\cos\omega t = \left(\frac{x}{a}\cos\beta - \frac{y}{b}\cos\alpha\right)\Big/\sin(\beta-\alpha).$$

Squaring and adding we eliminate t and obtain the equation of the path,

$$(50) \qquad \frac{x^2}{a^2} + \frac{y^2}{b^2} - 2\frac{x}{a}\frac{y}{b} = \sin^2(\alpha-\beta),$$

which represents an ellipse. The motion is called *elliptic harmonic motion*. The ellipse is evidently inscribed in a rectangle of sides $2a$, $2b$ (Fig. 22), and according to the values of $\alpha-\beta$ may have any shape, reducing to a straight line when $\alpha-\beta$ is zero or 180°. If the two harmonic vibrations are not of the same period, the resulting path belongs to a system of curves associated with the name of Lissajous. They may be easily constructed point by point, but the elimination of t will be possible only if the periods have a common measure.

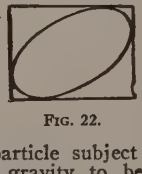

Fig. 22.

Suppose a particle subject to the constant acceleration of gravity to be constrained to

move in a vertical circle of radius l (Fig. 23). The component of the acceleration g in the direction of the tangent is $-g \sin\theta$, while the distance moved from the bottom of the circle

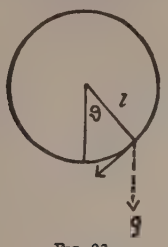

FIG. 23.

is $l\theta$. We thus have the differential equation

$$(51) \qquad \frac{d^2s}{dt^2} = l\frac{d^2\theta}{dt^2} = -g\sin\theta.$$

The solution of this equation requires elliptic functions, but if θ is small enough we may neglect the difference between the angle θ and its sine, so that the equation of motion is

$$(52) \qquad \frac{d^2\theta}{dt^2} = -\frac{g}{l}\theta,$$

which is the same as the equation (46) of harmonic motion with $\omega^2 = g/l$. Accordingly the small vibrations of a pendulum are harmonic, of the period $T = 2\pi\sqrt{\frac{l}{g}}$, which is independent of the amplitude of oscillation. The fact of this *isochronism* of the pendulum, or independence of the period from the amplitude, was discovered by Galileo, while the laws of uniform circular and of harmonic motion, and of the pendulum, were found by Huygens. The latter also used the formula $g = \frac{4\pi^2 l}{T^2}$ to determine the value of g.

Let us now examine the consequences of the celebrated laws discovered by Kepler as governing the motion of the planets about the sun. The first law states that the areas swept over by the radius vector from the sun to a planet in equal times are equal. Calling the area S, $\frac{dS}{dt} = \text{const.}$ But differentiating the value of $\frac{dS}{dt}$ given in (34), we find

$$(53) \qquad 2\frac{d^2S}{dt^2} = x\frac{d^2y}{dt^2} - y\frac{d^2x}{dt^2} = xa_y - ya_x.$$

But this is the *moment* of the acceleration with respect to the origin, and if it vanishes, the acceleration must be directed toward the origin. The kinematical interpretation of the first law is then that the planets are accelerated toward the sun. The second law states that the planets describe ellipses about the sun as a focus. The equation of a conic section referred to its focus is

$$r = \frac{p}{1 + e\cos\phi}, \qquad p = a(1-e^2),$$

where a is the major axis, e the eccentricity. Now to resolve the acceleration along the radius vector, we multiply its components a_x, a_y, respectively, by the direction cosines of the radius vector, which are $\cos\phi$, $\sin\phi$. Differentiating the equations for change of co-ordinates $x = r\cos\phi$, $y = r\sin\phi$, twice, we have

$$a_x = \frac{d^2x}{dt^2} = \frac{d^2r}{dt^2}\cos\phi - 2\sin\phi\frac{d\phi}{dt}\frac{dr}{dt} - r\sin\phi\frac{d^2\phi}{dt^2} - r\cos\phi\left(\frac{d\phi}{dt}\right)^2,$$

$$a_y = \frac{d^2y}{dt^2} = \frac{d^2r}{dt^2}\sin\phi + 2\cos\phi\frac{d\phi}{dt}\frac{dr}{dt} + r\cos\phi\frac{d^2\phi}{dt^2} - r\sin\phi\left(\frac{d\phi}{dt}\right)^2,$$

from which

$$(54) \qquad a_r = a_x\cos\phi + a_y\sin\phi = \frac{d^2r}{dt^2} - r\left(\frac{d\phi}{dt}\right)^2.$$

Now by Kepler's first law,

$$2\frac{dS}{dt} = r^2\frac{d\phi}{dt} = \text{const.} = h, \qquad \frac{d\phi}{dt} = \frac{h}{r^2}.$$

Changing the variable from t to ϕ,

$$\frac{dr}{dt} = \frac{dr}{d\phi}\frac{d\phi}{dt} = \frac{h}{r^2}\frac{dr}{d\phi} = -h\frac{d}{d\phi}\left(\frac{1}{r}\right).$$

Differentiating by t,

$$\frac{d^2r}{dt^2} = -h\frac{d^2}{d\phi^2}\left(\frac{1}{r}\right)\frac{d\phi}{dt} = -\frac{h^2}{r^2}\frac{d^2}{d\phi^2}\left(\frac{1}{r}\right).$$

From the equation of the path we obtain

$$\frac{1}{r} = \frac{1}{p} + \frac{e}{p}\cos\phi, \quad \frac{d^2}{d\phi^2}\left(\frac{1}{r}\right) = -\frac{e}{p}\cos\phi = \frac{1}{p} - \frac{1}{r},$$

from which

$$\frac{d^2r}{dt^2} = -\frac{h^2}{pr^2} + \frac{h^2}{r^3}, \quad a_r = -\frac{h^2}{pr^2}.$$

Thus the fact that the path is a conic section shows that the acceleration is inversely as the square of the distance from the focus. The negative sign shows that it is *toward* the sun.

The third law states that for different planets the squares of the times of description of the orbits are proportional to the cubes of the major axes. Since $2dS/dt = h$, if T is the time of a complete period hT is twice the area of the orbit.

$$hT = 2\pi ab = 2\pi a^2\sqrt{1-e^2}, \quad h^2 = \frac{4\pi^2a^4}{T^2}(1-e^2),$$

$$(55) \qquad a_r = -\frac{h^2}{pr^2} = -\frac{h^2}{a(1-e^2)}\frac{1}{r^2} = \frac{4\pi^2a^3}{T^2}\frac{1}{r^2}.$$

Now since a^3/T^2 is the same for all the planets, we see that the factor of $1/r^2$ in the acceleration is the same for all the planets. These kinematical interpretations of Kepler's laws in terms of acceleration were given by Newton.

6. KINETICS.— The whole of our experience of dynamical phenomena was summed up by Newton in his *Axioms or Laws of Motion*, which are as follows:

I. *Every body persists in its state of rest or of uniform motion in a straight line, except in so far as it is compelled by impressed forces to change that state.*

The property of persistence thus defined is called *Inertia*. The law of inertia was recognized in a less definite way by Galileo, but Newton makes of it a criterion for the existence of force, and in fact implies that if a body is moving in any other way than uniformly in a

straight line, that is, without acceleration, it is acted on by a force. The second law gives a positive definition of force.

II. *Change of motion is proportional to the moving force applied, and takes place in the direction of the straight line in which the force acts.*

In the explanation of this law, and in a corollary appended, Newton makes clear that it is intended to include the independence of effect of two simultaneous forces, and their composition by the parallelogram.

In his introductory definitions, Newton states what he means by quantity of motion, to which force is proportional, namely, the product of velocity by mass, or what is now called *momentum,* but the motion of mass is best introduced by the third law, which is perhaps the most important, as well as original, of the three.

III. *To every action there is always an equal and contrary reaction; or, the mutual actions of any two bodies are always equal and oppositely directed.*

If the force were measured by the acceleration alone, the accelerations of the two interacting bodies would be *equal* and opposite; that is not the case, but they are found to be proportional, with a factor of proportionality which is found to be always the same for two given bodies, no matter how they act on each other. For example, let them be connected by a string, and act on each other through its tension, or by an elastic cord whose length may vary. If for symmetry we write a factor for each acceleration,

$$(56)\quad m_1\frac{d^2x_1}{dt^2}=-m_2\frac{d^2x_2}{dt^2},\quad m_1\frac{d^2y_1}{dt^2}=-m_2\frac{d^2y_2}{dt},$$
$$m_1\frac{d^2z_1}{dt^2}=-m_2\frac{d^2z_2}{dt^2},$$

the factors m_1, m_2 are called the *masses* of the bodies, and their ratio is determined by the ratio of the accelerations. Thus we may compare the mass of any body with that of a given body taken as a unit. The usual unit of mass is the pound or the gram.

By the introduction of the conception of mass and of momentum we pass from kinematics to kinetics, or dynamics proper. As long as we were concerned with one body at a time, like Galileo and Huygens, the notion of acceleration was sufficient, but when we deal with a number of bodies with mutual actions, the notion of force is necessary. The terms on either side of equations (56) represent the forces, and the equations express the third law. The second law may now be stated by saying that force is the rate of change of *momentum.* The forces generally are known in terms of the positions of the bodies, and perhaps of their velocities, and when given by their components X, Y, Z as functions of these quantities, the equations

$$(57)\qquad m\frac{d^2x}{dt^2}=X,\quad m\frac{d^2y}{dt^2}=Y,\quad m\frac{d^2z}{dt^2}=Z$$

are called the differential equations of motion.

Our kinematical examples of the previous section may now be dynamically interpreted. The fact that bodies fall with a common acceleration g shows that the forces with which they are moved toward the earth, or their weights, $W=mg$, are proportional to their masses. The unit of force, namely, that force which produces in a pound an acceleration corresponding to an increase of velocity of one foot per second in each second, has received the name of *poundal.* The weight of each pound is accordingly g poundals. The unit generally used by scientists is the force which produces in a gram the acceleration corresponding to an increase of velocity of one centimeter per second in each second. This force is called a *dyne,* and the weight of a gram is g dynes. These units are called *absolute* units, as they do not depend on accidental circumstances of time or place, but are referred to three fundamental units, of time, length and mass, the latter two of which are preserved in concrete standards, the former is preserved in the rotation of the earth. The more familiar *gravitation unit,* which we have used in the section on statics, and which is the *weight* of the pound or gram, is not absolute, since g varies at different parts of the earth, according to the formula

$$(58)\quad g=980.62-2.6\cos 2\lambda-.000003h,$$

where λ is the latitude, h the height above sea-level, and the units are the centimeter and the second. The weight of a body is accordingly variable, but its mass is invariable. For $\lambda=45°$, at sea-level we have

Weight of pound $=32.17$ *poundals,*
Weight of gram $=980.62$ *dynes.*

The popular usage of the term pound or gram to denote both a mass and a force is unfortunate, and should be avoided.

The fact that the weights of bodies are proportional to their masses was carefully tested by Newton by constructing pendulums of different materials, and finding that the acceleration, as determined by the time of oscillation, was independent of the substance.

The fact that a body moving uniformly in a circle has a centripetal acceleration v^2/r shows that it is acted on by a force toward the centre (centripetal force) equal to mv^2/r. If the body, for instance, be revolved in a horizontal orbit on a whirling machine, and be held in place by a string, this string may be passed over a pulley and support a weight, so that we may thus make a comparison between the absolute dynamical measure of force and the gravitational statical one previously used. By repeating the experiment with another revolving mass, we may compare the masses of two bodies, by the process of comparing both with the same weight. This illustrates the dynamical comparison of masses. The usual statical method of comparison by a balance is actually a comparison of *weights,* and gives a correct comparison of masses because the value of g is the same at each pan. If we used a balance-beam so long that g differed sensibly at its two ends, equality of weights would not mean equality of masses.

Another simple illustration of the dynamical method of comparison of masses is furnished by Atwood's machine, by which the laws of falling bodies may be studied. Two masses, m_1, m_2, Fig. 24, are hung from a string passage over a frictionless pulley. Since the distance moved up by one mass is equal to that moved down by the other, the velocities and accelerations of the two are equal and opposite. Each

mass is acted upon by two forces, the tension of the string upwards and its own weight downwards. The tension is the same for both. Con-

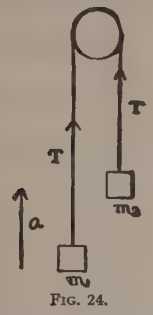

FIG. 24.

sequently we have for the acceleration a,

$$m_1a_1 = \quad m_1a = T - m_1g,$$
$$m_2a_2 = -m_2a = T - m_2g,$$

from which we obtain

$$a = \frac{m_2 - m_1}{m_2 + m_1}g;$$

that is, the acceleration is to that of a body falling freely as the difference to the sum of the masses. Thus by observing the acceleration the masses may be compared. In the usual use of Atwood's machine that difference of masses is produced by an extra weight, which is taken off at a certain height by a fixed ring, after which the two remaining equal masses travel with uniform velocity, and by the velocity generated the acceleration is determined.

The properties of harmonic motion show that a body acted upon by a force proportional to its displacement from a fixed point will execute a harmonic vibration. When a point has a position of equilibrium and is displaced therefrom, forces will in general be brought into play tending to restore it to its position, and these forces will depend upon the displacement. If the displacement be small enough, the forces will be approximately proportional to the displacement, hence the frequency of harmonic vibrations in nature. The vibration of the pendulum or of a tuning-fork are examples.

From the generalization that all the planets are accelerated toward the sun with an acceleration $a = c/r^2$, where c is constant for all, Newton, putting the force equal to cm/r^2, and seeing that the masses of the two interacting bodies, the sun and planet, must enter symmetrically, was led to assume $F = \gamma Mm/r^2$, and from the law of reaction this would also be the force urging the sun toward the earth. Thus he was led to the generalization of universal gravitation, namely, the statement that every mass in the universe attracts every other with a force proportional to the product of both their masses, and inversely to the square of the distance apart. (The number γ is the same for all, depending only on the units used).

Newton tested this by comparing the acceleration of the moon due to the earth's attraction with the acceleration of a body at the earth's surface. Supposing the moon's orbit to be circular, of radius r and period T, its acceleration will be by (55) $a_m = 4\pi^2 r/T^2$. If the acceleration varies inversely as the square of the distance, at the surface of the earth, it will be

$$a_s = a_m\frac{r^2}{R^2} = \frac{4\pi^2 r^3}{R^2T^2},$$

where R is the earth's radius.

Now we have

$T = 27d\cdot 43$ m. $= 39{,}343$ m., $2\pi R = 4 \times 10^7$ meters, $r = 60R$,

from which

$$a_s = \frac{2\pi\cdot 60^3\cdot 4\cdot 10^7 \text{ meters}}{(39{,}343\cdot 60 \text{ sec})^2}$$

$$= 9{\cdot}74\ \frac{\text{meters}}{\text{sec}^2} = 974\ \frac{\text{cm.}}{\text{sec}^2}.$$

This agrees well with the value of g from terrestrial observations, while more exact calculations give a still better agreement.

The value of the Newtonian constant, γ, or the number of dynes of attraction of two masses each of one gram, one centimeter apart, is $\gamma = 6.6576.10^{-8}$.

A highly important contribution was made by d'Alembert, who made it possible to reduce every problem of dynamics to one of statics. If a system of particles be not free, they cannot move under the influence of given applied forces as they would if not constrained, but the reactions will cause them to move otherwise, as in the case of the masses in Atwood's machine. For another instance, consider two bullets fastened together by a string and thrown at random into the air. If free each would describe plane curves, namely, vertical parabolas. Under the influence of the tensions of the string which causes the constraint, they describe looped or tortuous paths. If we knew the actual paths and motions, we could find forces which would produce the same motions if the particles were free. These d'Alembert calls the effective forces and they are given by

$$X' = m\frac{d^2x}{dt^2},\quad Y' = m\frac{d^2y}{dt^2},\quad Z' = m\frac{d^2z}{dt^2}.$$

D'Alembert's principle states that the actual applied forces, together with the *reversed* effective sources, would form a system in equilibrium. If we express the equilibrium by means of the equation of virtual work, (25), we obtain

$$\sum_r \{(X_r - X'_r)\delta x_r + (Y_r - Y'_r)\delta y_r + (Z_r - Z_r')\delta z_r = 0$$

or

$$(58)\quad \sum_r \left\{\left(m_r\frac{d^2x_r}{dt^2} - X_r\right)\delta x_r + \left(m_r\frac{d^2y_r}{dt^2} - Y_r\right)\delta y_r + \left(m_r\frac{d^2z_r}{dt^2} - Z_r\right)\delta z_r\right\} = 0.$$

This equation, given by Lagrange, was made by him the basis of all dynamics. Since the reactions would of themselves form a system of forces in equilibrium, they may be left out of the equation (58) of d'Alembert's Principle.

From the equation (58) we can deduce all the principles of dynamics. Suppose every particle is free, then all the virtual displacements, δx_r, δy_r, δz_r, are independent, and in

order that the equation may hold for arbitrary displacements, we must have

$$(59)\qquad m_r\frac{d^2x_r}{dt^2}=X_r,\quad m_r\frac{d^2y_r}{dt^2}=Y_r,\quad m_r\frac{d^2z_r}{dt^2}=Z_r$$

for every r. But these are Newton's equations of motion.

If the particles be free or form a rigid system, a virtual displacement will be given when δx_r, δy_r, δz_r, have the same values for all the particles. We may then remove these factors from the summation.

$$(60)\qquad \delta x\left(\sum_r m_r\frac{d^2x_r}{dt^2}-\sum_r X_r\right)+\delta y\left(\sum_r m_r\frac{d^2y_r}{dt^2}-\sum_r Y_r\right)+\delta z\left(\sum_r m_r\frac{d^2z_r}{dt^2}-\sum_r Z_r\right)=0,$$

and if δx, δy, δz, are arbitrary, this requires

$$(61)\qquad \sum_r m_r\frac{d^2x_r}{dt^2}=\sum_r X_r,\ \sum_r m_r\frac{d^2y_r}{dt^2}=\sum_r Y_r,\ \sum_r m_r\frac{d^2z_r}{dt^2}=\sum_r Z_r.$$

Now we have

$$(62)\qquad \sum_r m_r\frac{d^2x_r}{dt^2}=\frac{d^2}{dt^2}\sum_r m_rx_r=\left(\sum_r m_r\right)\frac{d^2\bar{x}}{dt^2},$$
$$\sum_r m_r\frac{d^2y_r}{dt^2}=\frac{d^2}{dt^2}\sum_r m_ry_r=\left(\sum_r m_r\right)\frac{d^2\bar{y}}{dt^2},$$
$$\sum_r m_r\frac{d^2z_r}{dt^2}=\frac{d^2}{dt^2}\sum_r m_rz_r=\left(\sum_r m_r\right)\frac{d^2\bar{z}}{dt^2},$$

where $\bar{x}$, $\bar{y}$, $\bar{z}$ are the co-ordinates of the centre of mass, which obviously coincides with what in the treatment of statics has been called the centre of gravity. We thus find that the centre of mass of a free system, or of a rigid body, moves as if all the forces of the system were applied at that point and all the mass were concentrated there. In particular if the system is exposed to no external forces, but only to its mutual actions, since these are equal and opposite in pairs, they destroy each other. Consequently the centre of mass of such a system moves uniformly in a straight line. This applies to the solar system.

Under the same conditions, a rotation about an axis is a virtual displacement. Putting as in (22) $\delta x=-y\delta\theta$, $\delta y=x\delta\theta$, $\delta z=0$, and dividing out $\delta\theta$ we have

$$(63)\qquad \sum_r m_r\left(x_r\frac{d^2y}{dt^2}-y_r\frac{d^2x}{dt^2}\right)=\sum_r(x_rY_r-y_rX_r).$$

The quantity on the right is the z-component of the resultant moment of all the impressed forces, as in (9), (23), which will be denoted by the components L, M, N.

The quantity on the left may be written

$$\frac{d}{dt}\sum_r m_r\left(x_r\frac{dy_r}{dt}-y_r\frac{dx_r}{dt}\right).$$

The quantity whose derivative appears,

$$(64)\qquad H_z=\sum_r\left(x_rm_r\frac{dy}{dt}-y_rm_r\frac{dx_r}{dt}\right)=\sum_r(x_rm_rv_{yr}-y_rm_rv_{xr}),$$

is evidently the z-component of the resultant *moment of momentum* of all of the particles of which the system is composed. We thus have the principle that if we construct a vector H having the components H_x, H_y, H_z, where

$$H_x=\sum_r(y_rm_rv_{zr}-z_rm_rv_{yr}),$$
$$H_y=\sum_r(z_rm_rv_{xr}-x_rm_rv_{zr}),$$
$$H_z=\sum_r(x_rm_rv_{yr}-y_rm_rv_{xr}),$$

in virtue of the equations

$$(65)\qquad \frac{dH_x}{dt}=L,\quad \frac{dH_y}{dt}=M,\quad \frac{dH_z}{dt}=N,$$

the velocity of the extremity of the vector H, representing the moment of momentum of the system, is equal and parallel to the resultant moment of the impressed forces about the same point. This principle, with that of equations (61), suffices for the treatment of the motion of a rigid body. By putting all velocities equal to zero we obtain the conditions of equilibrium as in (9).

If in equation (58) we put for δx_r, δy_r, δz_r, the distance actually traversed by the various points in the actual motion in the interval dt,

$$\delta x_r=\frac{dx_r}{dt}dt,\quad \delta y_r=\frac{dy_r}{dt}dt,\quad \delta z_r=\frac{dz_r}{dt}dt,$$

we obtain

$$(66)\qquad \sum_r m_r\left(\frac{d^2x_r}{dt^2}\frac{dx_r}{dt}+\frac{d^2y_r}{dt^2}\frac{dy_r}{dt}+\frac{d^2z_r}{dt^2}\frac{dz_r}{dt}\right)dt-\sum_r\left(X_r\frac{dx_r}{dt}+Y_r\frac{dy_r}{dt}+Z_r\frac{dz_r}{dt}\right)dt=0,$$

and we may write the sum of terms containing the accelerations as an exact derivative,

$$\frac{d}{dt}\frac{1}{2}\sum_r m_r\left[\left(\frac{dx_r}{dt}\right)^2+\left(\frac{dy_r}{dt}\right)^2+\left(\frac{dz_r}{dt}\right)^2\right]=\frac{dT}{dt}.$$

The quantity T whose derivative appears, which is one-half the sum of the products of the mass of each particle by the square of its velocity, is the very important quantity called the *kinetic energy*. Integrating equation (66) between the limits t_0 and t_1,

$$(67)\qquad T_1-T_0=\sum_r\int_{t_0}^{t_1}(X_rdx_r+Y_rdy_r+Z_rdz_r),$$

where T_0 and T_1 denote the values of T at the respective instants t_0 and t_1.

The integral on the right is the work (14) done by all the applied forces during the motion. We thus obtain the principle that *the increase of kinetic energy of a system is equal to the work done by the forces.* Suppose now that the system be taken from one given configuration, where all the co-ordinates have given values, to a second, where they have other given values, the particles describing given paths, and they then be taken from the same initial configuration to the same terminal one, but by other paths. Two cases are to be considered. Either the work done by the forces depends upon the paths, or it is independent of the paths, depending only on the terminal configurations. If the integral

$$\int_{t_0}^{t_1}(X_rdx_r+Y_rdy_r+Z_rdz_r)$$

does not depend upon the path, it can be shown

that every component of every force is the partial derivative of a single function $-W$ of all the co-ordinates, by the corresponding co-ordinates.

$$(68) \qquad X_r = -\frac{\partial W}{\partial x_r}, \quad Y_r = -\frac{\partial W}{\partial y_r}, \quad Z_r = -\frac{\partial W}{\partial z_r}.$$

We then have

$$\sum_r \int_{h_0}^{h} (X_r dx_r + Y_r dy_r + Z_r dz_r) = W_0 - W_1,$$

and the equation (67) becomes

$$T_1 - T_0 = W_0 - W_1,$$

or

$$(69) \qquad T_1 + W_1 = T_0 + W_0.$$

The sum of the two functions $T + W$ is then constant during the motion. As T is called the kinetic, W is called the *potenial energy* of the system. Such systems are called *conservative systems,* and the above principle is called the principle of the *Conservation of Energy.* The motion of energy is of the greatest importance in dynamics. The principle was first used by Huygens and was generally stated by John and Daniel Bernoulli.

As an example of a conservative force we may take gravity. For a single particle we have $W = mgz$ (z being measured upward), so that the equation of energy is

$$\tfrac{1}{2}mv^2 + mgz = \text{const.} = \tfrac{1}{2}mv_0^2 + mgz_0,$$
$$v^2 - v_0^2 = 2g(z_0 - z) = 2gh.$$

Accordingly the velocity attained by a falling particle does not depend on the form of the path, but only on the height fallen. This was known to Galileo, for bodies falling along the inclined plane or the arc of a circle. All forces acting according to the Newtonian law are also conservative.

We have now stated in summary fashion the principal theorems of *Mechanics.* The scope of this article does not permit us to enter into the details of the various methods which arise for treating the more complicated problems, say of the motion of a rigid body. By means of the equations (65), however, we may form an idea of some of the properties of such motions. We have seen that the centre of mass moves as if the whole body were concentrated and all the forces applied there. To find the motion of rotation we have to investigate the moment of momentum of a rigid body. If the body rotate about an axis with angular velocity $d\theta$, we obtain the velocity of a point at a distance r from the axis by differentiating the equations $x = r\cos\theta$, $y = r\sin\theta$,

$$v_x = -r\sin\theta\frac{d\theta}{dt} = -y\frac{d\theta}{dt}, \qquad v_y = r\cos\theta\frac{d\theta}{dt} = x\frac{d\theta}{dt},$$

and the moment of momentum is

$$H_z = \sum_r m_r(x_r v_{yr} - y_r v_{xr}) = \frac{d\theta}{dt}\sum_r m_r(x_r^2 + y_r^2).$$

The quantity $K = \Sigma_r m_r(x_r^2 + y_r^2) = \Sigma_r m_r r_r^2$ is called the *moment of inertia* of the body with respect to the axis. Suppose the axis is horizontal, and the body influenced only by gravity. The resultant of the weights of all the particles of the body is a force $W = Mg$ applied at the centre of mass, which is, say, at a distance h from the axis, the plane through it and the axis making an angle θ with the vertical. Then the moment of all these forces about the axis is $N = Mgh\sin\theta$, and we have the equation of motion

$$(70) \qquad \frac{dH_z}{dt} = K\frac{d^2\theta}{dt^2} = -Mgh\sin\theta.$$

This is the same as that of a simple pendulum of length $l = K/Mh$, which is called the length of the equivalent simple pendulum. A point at a distance l from the axis and in line with it and the centre of mass is called the *centre of oscillation.* This problem of the so-called compound pendulum was solved by Huygens, who also showed that if the body be suspended from a parallel axis through the centre of oscillation the period would be the same.

If a rigid body move in any manner with one point fixed, it may be shown that its motion at any instant may be described as a rotation with a certain angular velocity about a certain axis. All the particles of the body are then moving in various directions tangent to circles with planes parallel to each other, but owing to lack of symmetry the direction of the resultant moment of momentum has no simple relation to the direction of the axis.

FIG. 25.

As the motion goes on the direction of the axis changes in the body, and so does the direction of the moment of momentum. Thus the phenomenon is a complicated one, and can be dealt with only by lengthy analysis. If, however, the axis of rotation is an axis of symmetry, as in the case of the axis of a symmetrical top, Fig. 25, it is evident that the particles may be grouped in symmetrical pairs, m_1, m_2, Fig. 26, so that the moments of momentum H_1, H_2 about the fixed point O will be symmetrical with respect to the axis, and the resultant moment will be in the direction of the axis. If then we apply to the axis a force F (Fig. 25),

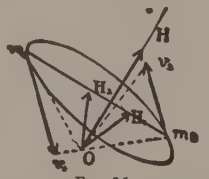

FIG. 26.

it will have a moment M (Fig. 27), perpendicular to the plane of F and the fixed point, and according to equations (65) this will be the direction in which the vector H will move toward H'. The end of the axis will, therefore, move at right angles to the direction in which it is pulled. This is the basis of the explanation of the curious phenomena of all tops and gyroscopes. In the ordinary top, the weight

acting downwards at the centre of mass produces a horizontal moment; the point of the top accordingly begins to move horizontally, causing a movement of *precession*. When the precession begins, the rotation is no longer

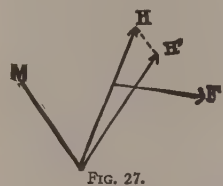

FIG. 27.

about the axis of symmetry, and the vector H no longer coincides with the geometrical axis of the top, but the end of the vector H always travels in a horizontal plane, and the axis of the top moves about it in a motion of so-called nutation. The rotary motions of the planets are explained in a similar manner. It has recently been demonstrated by Einstein that the classical, Newtonian mechanics presented here is only a first approximation to the facts. The discrepancies between the Newtonian and the Einsteinian mechanics are due to the fact that time and space, as ordinarily conceived, are not independent dimensions of being. See RELATIVITY, PRINCIPLE OF.

ARTHUR GORDON WEBSTER,

MECHANICS OF DEVELOPMENT OR EVOLUTION. A term applied by German embryologists and biologists to the changes coincident with the reproduction, fertilization and later growth of organisms. In the organic world, living bodies are constantly undergoing changes of state, these changes being most conspicuous during the period of embryonic development. The changes in the conditions of life together with heredity and selection have caused the evolution of the world of plants and animals. These changes have been complex, and yet in every way have been made with exactness, order and regularity, and the larger knowledge of development mechanics has in a great measure been due to the researches of Pander, Lotz, Born, Wilson, Loew, Ryder, Wyman, Driesch and others. Probably the most noteworthy treatments, though of opposing schools, are those of Von Wilhelm Roux, 'Programm und Forschungsmethoden der Entwichlungsmechanik der Organismen leichverständlich dargestellt' (Leipzig 1897), and of Dr. Oscar Hertwig, 'Zeit- und Streitfragen der Biologie: Mechanik und Biologie' (Jena 1897). Nature does for man in the organic what he has to effect in the inorganic world, and it is only necessary that he observe these changes to be able to state a series of relations of antecedent and consequent. See LIFE; GROWTH; KINETOGENESIS.

MECHANICS' INSTITUTES. The establishment of mechanics' institutes marks the struggle of the artisan to provide for his own education. Denied a technical education, unable to take advantage of college and university education because of financial and economic stress, the artisan nevertheless demands for himself such educational opportunities as he can use during his free hours. His needs are peculiar. His range of interests is prescribed by his trade or vocation, his time is limited, his preparation is likewise limited and variable. His demands cannot be satisfied, therefore, by conventional methods and equipments. A special organization must be set up. Mechanics' institutes are a distinctive product of England, no other country having developed an equal number of such organizations. Nor are such institutions characteristic of any other national educational scheme. The reason for this is the conservatism of English universities and higher educational institutions generally. The artisan was not provided with a systematic training beyond the fundamentals of his trade as given by a more or less definite apprentice system. Industrial education and manual training were not made a part of public education until late in the 19th century. Hence the necessity for the artisan to devise a scheme for educational extension into his adult years, an education that would meet his specific needs. Birmingham and Glasgow were the pioneers in developing educational opportunities for mechanics. In Birmingham Sunday lectures in mechanics and in the physical sciences were given as early as 1789. An "Artisan Library" was maintained. Glasgow organized its Mechanics' Institute in 1823. This is probably the first use of the term. The London Mechanics' Institution was founded in the same year and was under the leadership of Dr. Birkbeck, who had been instrumental in the maintenance of the work in Birmingham. Liverpool followed with its Mechanics' and Apprentices' Library in 1825. Other cities followed and in 1839 a Metropolitan Association of Mechanic's Institutions were formed; in 1848 a similar association known as the Yorkshire Union was formed with 86 institutions as members.

The range of work became wider as the movement grew. The Manchester Mechanics' Institute announced its purpose to be "to enable artisans of whatever trade to become acquainted with such branches of science and art as are of practical application in their trade." The subjects offered either by lecture or class instruction were as follows: natural philosophy, science, natural history, literature, writing, grammar, composition, algebra, geometry, drawing, music, French, German, Latin. This is indicative of the scope of the work attempted.

The aim of the mechanics' institutes was to bring education within reach of the middle and lower classes in England. The programs show that it was an effort to give as much of the traditional content of education as these classes could assimilate. It was education given to mechanics, but much of it was not about mechanics nor yet about industry or closely re-

lated matters. Herein lies the explanation for the decline of the movement. The institutes failed to hold their clientèle as the artisans lacked the necessary educational background. But out of and on these foundations have grown the highly efficient technical schools which are in successful operation today.

Mechanics' institutes were also established in the United States, notably in Boston, Philadelphia, New York and Rochester, N. Y. A few are still in successful operation. It is notable that they are taking an important part in the development of vocational and industrial education in the United States. With free public schools, especially free state colleges and state universities, giving extensive courses in the mechanic arts and in the sciences, there is less demand for these private institutions with their special appeal to the mechanics' interests. Their function has been that of the pioneer. They have blazed the way for engineering and technical schools and for vocational and trade schools. See also EDUCATION, INDUSTRIAL; EDUCATION, TECHNICAL; MANUAL TRAINING; COOPER UNION; VOCATIONAL EDUCATION.

A. R. BRUBACHER,
Late President, State College for Teachers, Albany, N. Y.

MECHANICS' LIENS, *in statute law,* a lien or claim upon real estate to secure payment for work or labor performed on, or materials furnished for, buildings or other improvements thereon; which labor or material has been furnished at the request or with the consent, express or implied, of the owner of such real estate or other property. In early English law lands were charged with liens by express agreement of the owner and were generally covered by mortgages. Courts of equity also recognized mortgage agreements. By statute other liens were created, including judgment liens and liens for taxes and assessments.

In the United States the increasing number of independent contractors who constructed buildings on contract, and of dealers in building material, resulted in the enactment of numerous mechanic lien laws. Such laws have also been enacted in Canada, but not in Great Britain. The statutes hold that the value of real estate is increased by the addition of improvements and that the property should accordingly be held subject to such claims. Mechanics' liens are valid prior liens over all other claims, such as mortgages, judgments or taxes, and the term covers all claims for labor, whether skilled or unskilled, and for all building materials furnished. But liens are held against the property and not personally against the owner. The lien only attaches to the very property upon which the work was done, and has no effect on other pieces of real estate of the owner.

In most states the law provides that the work to which the owner is entitled under a contract must be entirely performed before the contractor can file a lien, but where owners' payments are made in instalments, some codes permit the filing of a lien when the owner defaults in the payment of an instalment. Liens usually take precedence according to the time of their filing in the county clerk's office. In some states subcontractors, who have not had direct dealings with the owner, may nevertheless file liens against the property for the work performed by them. The statutes of mechanics' liens vary in the different states in the manner of details, time of filing, method of procedure, etc., and state statutes should be consulted.

MECHANICSBURG, mê-kăn'ĭks-bûrg, borough, Pennsylvania, in Cumberland County; altitude 430 feet; 9 miles southwest of Harrisburg; on the Pennsylvania Railroad. It is located within a farming area raising fruits, field crops, and hay, and there are clay pits nearby. Industrial products are shirts, pajamas, silks, automobile wheels, flavoring extracts, and structural steel.

The place was settled in 1790, and was called Drytown (from the scarcity of water) until 1828, when it was incorporated and renamed, the new name alluding to the number of mechanics employed in its machine shops. Pop. (1940) 5,709; (1950) 6,786.

MECHANICSVILLE, Battle of (also called BATTLE OF BEAVER DAM CREEK). After the Battle of Oak Grove, June 25, 1862, the Army of the Potomac was thrown upon the defensive by the sudden appearance of "Stonewall" Jackson on its right. North of the Chickahominy, George McClellan had but one corps in position, that of Fitz-John Porter, temporarily strengthened by a division of Pennsylvania reserves. The reserves held the extreme right of the line at Mechanicsville and Beaver Dam Creek, with three brigades and five batteries of 26 guns. His main position was along the east bank of the creek, a tributary of the Chickahominy, and was very strong, his left resting on the Chickahominy, his right and advance extending to a body of woods near and overlooking Mechanicsville, held by a regiment and a battery. Rifle-pits had been constructed for the infantry, epaulments had been thrown up to cover the guns and a strong picket-line was in front from Mechanicsville Bridge to Meadow Bridge along the Chickahominy. A. P. Hill's Confederate division and Thomas Cobb's Legion were in plain view from the left, intrenched on the opposite side of the Chickahominy.

About noon of the 26th Hill's men were seen in motion. At 12.30 the Union pickets at Meadow Bridge were driven in; John Reynolds' brigade on the right, covering the crossing of the road from Mechanicsville to Bethesda Church; Truman Seymour on the left, covering at Ellerson's Mill the crossing of the road from Mechanicsville to Gaines' Mill; and Meade's brigade, with two batteries, in reserve. A. B. Hill had 14,000 men in his division, which he had concentrated near Meadow Bridge, under orders from Gen. Robert Lee to cooperate with Jackson, who was marching from Ashland to turn McClellan's right. Hill sent Lawrence Branch's brigade and a battery to cross the Chickahominy seven miles above Meadow Bridge and communicate with Jackson's advance, and when Jackson had crossed the Virginia Central Railroad, Branch was to cross the Chickahominy, push down the river and uncover Meadow Bridge, which Hill was to cross at once and then sweep down to Mechanicsville, uncovering in turn the Mechanicsville Bridge, which James Longstreet's and D. H. Hill's divisions were to cross, when all were to push down the left bank of the Chickahominy and cut off McClellan's communications with his base at White House on the Pamunkey, and thus force him to abandon his operations against Richmond and retreat down the Peninsula. Jackson was late,

and it was 10 o'clock before Branch opened communications with him. As time passed and nothing was heard from Branch or Jackson, Hill grew impatient, and at 3 P.M. put his five brigades and six batteries in motion. Charles William Field's brigade seized Meadow Bridge and crossed it, closely followed by the brigades of Joseph Reid Anderson and James J. Archer. The brigades of Maxcy Gregg and William Dorsey Pender then crossed the bridge and marched across the country to support the right wing of the attacking column. Field was met by severe artillery fire, but, forming his troops in a line, he forced the Union advance of a regiment and battery from Mechanicsville back to the main line beyond Beaver Dam Creek.

It had not been Lee's intention to attack McCall in position, but to have Jackson turn it. Since Jackson was not up in time and McClellan would doubtless learn Lee's plan and make a counterattack against Richmond, Lee ordered A. P. Hill to attack. The brigades of Field, Archer, and Anderson were ordered to advance on the Mechanicsville road against Reynolds. They were met by heavy artillery fire and were bloodily repulsed, although one of Anderson's regiments on the left wing succeeded in making a temporary stand beyond the creek. Parts of Porter's corps now came up and strengthened Reynolds' right. Following the repulse on the left, Pender's brigade and Roswell Sabine Ripley's brigade of D. H. Hill's division made a determined attack on Seymour at Ellerson's Mill. A millrace, swampy ground, and other obstacles were in their way, however, and Seymour's direct fire and Reynolds' flank fire checked them and then repulsed them with heavy losses.

The attack was renewed, but it resulted in even greater losses, some regiments losing all their field officers and half of their men. It was now sunset, and no further effort was made to assault the position, but the firing was continued until 9 P.M. On the following morning, McCall was ordered to fall back on Gaines' Mill (see GAINES' MILL, BATTLE OF).

Union casualties at the Battle of Mechanicsville totaled 49 killed, 207 wounded, and 105 missing. Confederate losses, including both killed and wounded, were over 1,500 (Longstreet's estimate of 3,000 to 4,000 killed, wounded, and missing is probably excessive). In his account of the battle, General Longstreet said: "Next to Malvern Hill, the [Confederate] sacrifice at Beaver Dam was unequaled in demoralization during the entire summer."

C., *Story of the Civil War* (New York 1907); Steele, M. F., *American Campaigns,* 2 vols. (Washington 1909); Freeman, D. S., *R. E. Lee,* vol. 2 (New York 1934); id., *Lee's Lieutenants:* Vol. 1, *Manassas to Malvern Hill* (New York 1942).

MECHANICVILLE, city, New York, situated in Saratoga County, at an altitude of 105 feet, on the Hudson River and the New York State Barge Canal system, 19 miles by rail north of Albany. It is served by the Boston and Maine and the Delaware and Hudson railroads, both of which have repair shops in the city. Mechanicville processes dairy products from the surrounding agricultural area, and manufactures pulp and paper products, knit goods, women's dresses, and bricks. The city has a public library and a high school.

There is a monument to Elmer Ephraim Ellsworth (q.v.), colonel of a Zouave regiment, killed at the outbreak of the Civil War.

Settled before 1700, Mechanicville was incorporated as a village in 1859 and as a city in 1915. Government is of the commission type, and the city owns its water supply system. Pop. (1950) 7,385.

MECHANISM or **MECHANICAL THEORY.** In its most general meaning, mechanism is the relation of a limited number of invariable substances to each other in such a way that they vary in their relations according to invariable laws. More specifically, it means the explanation of phenomena by the universal laws of matter in motion. Mechanism is closely connected with the attempt to resolve bodies into their simplest elements and to explain their qualities as due to uniform laws of connection and interaction among these elements.

The mechanical theory has usually been held in connection with some form of atomism. Since the aim of this kind of explanation is to reduce qualitative determinations to quantitative and mechanical relations of elements, these elements have usually been conceived to possess only such qualities as are necessary to explain the empirical qualities, the ideal being to find a single, homogeneous element possessing only the characteristics essential to corporeity. The term "mechanical" is also used in a looser sense, though still within the limits of the general definition given above, to describe any explanation which regards all the qualities of a body as due to the mere summation of the qualities of its parts—that is, a mechanical theory of society.

Mechanism as a Theory of the World.— As a philosophical theory, mechanism is the attempt to regard the entire universe as a closed system of causes and effects in which every change is ultimately reducible to a change of motion. In this sense, therefore, it is practically synonymous with materialism (q.v.).

Mechanism as a Method of Explanation.— After the Middle Ages the development of the new science, at the hands of Nicolaus Copernicus, Johannes Kepler, Galileo Galilei (qq.v.), and many of their contemporaries, depended very largely on the application to nature of the method of mechanical explanation. Francis Bacon (q.v.), by his opposition to the use of teleology in scientific explanation, did much to bring about the acceptance of mechanism, and it was firmly established as the true scientific method of dealing with nature by René Descartes (q.v.), who, though not an atomist, still denied to matter all but quantitative characteristics and defined the method of science as strictly mechanical. Even the physical phenomena of living bodies (everything in the world, in fact, except the *res cogitans* in man) he regarded as capable of a purely mechanical explanation. From the 17th century on mechanism became the recognized method for natural science, and consequently it soon became an urgent philosophical problem to discover a satisfactory way of reconciling the mechanical conception of nature with a teleological and idealistic conception of the universe. Thus Gottfried Wilhelm von Leibnitz (q.v.), while admitting the necessity of reducing all natural phenomena to motion, held that ultimate reality consists of an infinity of centers of force (monads), conceived as in some sense analogous to minds. Accord-

ingly, metaphysical explanation must be in terms of teleology, though mechanism is the sole valid explanation of the phenomenal manifestation of reality in nature. A similar conception, having its historical origin in Leibniz, was held in the 19th century by Lotze (1817–81) (q.v.), who proclaims the purpose of his philosophy to be «to show how absolutely universal is the range of mechanism, and at the same time how completely subordinate the significance of the function which it has to fulfil in the structure of the world» ('Microcosmus,' Introduction). Kant also regards the mechanical categories as the sole valid means of scientific explanation. The causal category is, for him, rigorously constitutive of our experience and hence is determinant of our conception of all objects in the world of experience; teleology, on the other hand, though a necessary means of regulating our investigations of organized matter, remains a merely subjective principle which can give no insight into the origin of any being. When we deal with objects which «cannot be thought by us, as regards their possibility, according to the principle of mechanism,» we may treat them «as if» they were teleologically ordered; but «nothing is gained for the theory of nature or the mechanical explanation of its phenomena by means of its effective causes, by considering them as connected according to the relation of purposes.» The phenomena of the moral life, according to Kant, lie outside the realm of scientific experience and hence are not subject to mechanical explanation. Since Kant's time, many thinkers, perhaps the majority, have followed him in regarding mechanism as the ultimate principle of explanation for science; thus Helmholtz, F. A. Lange, Dubois-Reymond, Clausius, Thomson, Maxwell, etc. Wundt attempts to find for it a logical justification as the only theory which can afford an adequate conception of natural causality. On the other hand, more recent writers, especially among physicists, have taken the opposite view. According to them, the pre-eminence of mechanical explanation is merely a dogma based on its successful use in science. E. Mach, Stallo, Helm and H. Cornelius take this position. These thinkers maintain that the purpose of scientific explanation is to condense into a single compact statement (e.g., a mathematical formula) a large mass of empirical data. A scientific law is merely a short-hand statement of the facts, and its value is purely economic. So long as the mechanical theory affords useful analogues for the formulation of other phenomena, it is a valid scientific method. Whenever this ceases to be the case, mechanism must be superseded by a more economical theory. Kant's conception of mechanism as a mode of dealing with experience has been developed by contemporary English idealism. The general problem of all rational knowledge is conceived to be the construction and maintenance of a coherent and systematic experience. In all thought, therefore, there is implied a totality which constitutes the truth. But this totality manifests itself in different categories of thought and in varying degrees of perfection. Matter and motion are the abstractions in which the sensuous world is reduced to homogeneity in order to be susceptible of quantitative treatment, and in this treatment they are able to a large extent to represent genuine and actual relations of that world» (Bosanquet, 'Logic,' Vol. I, p. 200). Mechanical explanation, therefore, is one form in which the unity of thought may be manifested; it is «that form of identity and difference in which an identity is regarded as the sum of the difference in which it is presented» (ib., p. 201). Its value for knowledge is therefore said to be instrumental or methodological, because it is a method which thought uses in its effort to construct a rational experience. It possesses ultimate truth just in proportion to the degree of rational unity which it achieves in experience as a whole.

In psychology the term mechanism is sometimes used to describe a theory which seeks to explain mental phenomena as due to the combination or interaction of simply psychic elements. This usage is an analogy with the atomic theory of matter. The classical example is Herbart (q.v.), who gave the term currency. According to his theory every representation has a constant quality and a variable force. These forces stand in relations of greater or less opposition and the whole state of consciousness is conceived as a resultant of all the forces involved in it. Consult Th. Ribot's 'German Psychology of To-day' (Eng. trans. by J. M. Baldwin, pp. 24 ff.). For mechanism in biology see MECHANISM AND VITALISM.

GEORGE H. SABINE.

MECHANISM AND VITALISM. The Newtonian mechanics has long constituted an ideal for all the natural sciences on account of the elegance of its form and the clearness of its definitions. There has consequently been a tendency to reduce biology as well as chemistry, astronomy, optics, etc., to a mechanical basis and to explain all biological phenomena in terms of motions of particles. This tendency is known as *mechanism*, and those who follow it are called *mechanists*. Now, a living oganism, even from the purely mechanical side, is of the greatest complexity and intricacy of structure. Practically all organic tissues are colloidal in nature, and the physics and chemistry of even a simple colloid are as yet very imperfectly understood. Furthermore, the most minute observable portion of living tissue is far from being a simple colloid, but manifests a distinct and highly complicated structure. As a consequence, all mechanical explanations of living processes are bound to be of an extremely sketchy nature. Now, the actions of animals and plants are subject to fairly simple descriptions in terms derived from our own consciousness. When a spider catches a fly, we seem to render that fact intelligible to ourselves by saying that it wants to eat the fly. As a consequence, our biology as it exists is permeated through and through by anthropomorphic con-

cepts, such as purpose, desire, sensation, etc. While the mechanists claim that, as far as the scientist is concerned, all the facts ordinarily described through the mediation of these concepts are susceptible to a correlation in a fashion which, though purely mechanical, is too complicated for our own human faculties to grasp, there are others, the so-called *vitalists,* who deny this possibility.

The vitalists may either discover a peculiar purposive, anthropomorphic force active in biological matters alone, as does Driesch, or they may, like Bergson, regard the purposive account of the world as everywhere prior to the mechanical account. They draw their arguments from certain processes which, like the regeneration of lost parts, or the adaptation of the individual to the environment by mutation, appear peculiarly fitted for purposive explanations involving some prevision of the future. These processes they regard as not merely non-mechanical, but counter to the current of mechanism, involving either indeterminism, or determination through factors which have no mechanical correlates.

The paucity of the fruits of purely mechanical research in biology is obvious; on the other hand, the methods of the vitalist are generally so crude and his definitions so vague that there is no great body of biological knowledge which has been gained from the vitalistic standpoint. The terminology of vitalism abounds in such expressions as *élan vital,* or "entelechny," which are only defined *per ignotius.* In short, whether a complete mechanization of biology be possible or not, biological investigation has been fertile precisely in so far as it has subjected itself to the norms, if not to the concepts, of physical science. It would consequently seem that mechanism is methodologically correct, even if it be metaphysically wrong. See also MATERIALISM; MECHANISM.

Consult Bergson, Henri, 'Creative Evolution' (New York 1911); Driesch, Hans, 'The History and Theory of Vitalism' (London 1914); Mack, Ernst, 'Popular Scientific Lectures' (Eng. trans., Chicago 1895).

NORBERT WIENER.

MECHANISMS, Mental, are modes of thought obtaining both in the unconscious and in conscious mental activity, the most important of which are identification, compensation, projection, introjection and rationalization. In earliest infancy the average individual gradually makes a distinction between self and external reality, tending to regard as *himself* those parts of his experience which give him pleasure and as *external* those parts which give him pain. He thus very early unconsciously identifies himself with certain portions of his environment. This unconscious habit of thought continues throughout life. All persons constantly identify themselves with persons and things surrounding them or which come within their mental purview. This has the very important result of making them regard those external persons or things as having an influence over themselves and their acts and their emotions. Thus a man who defended the actions of a celebrated physician who was condemned and executed for murdering his wife was giving, in his defense, an illustration of identification of himself with the murderer, as was shown later to some extent by his confession that he lived very unhappily with his wife and sympathized with the criminal who had succeeded in getting rid of his partner in that way. Two varieties of identification are distinguished, namely, the subjective form or introjection, and the objective or projection. In introjection the subject accepts an idea which really has an external origin, and identifies it with some portion of his own mind, as for instance when one reads a description of some disease and infers that one has that disease oneself. This is a characteristic of impressionable and hypersensitive natures who feel an excessive sympathy for other people. It leads to various forms of introversion in which the individual tends more and more to live a life within himself and to become more and more unable to achieve objective success in the world. Projection, on the other hand, is that objective form of identification which takes an idea which has had actually an internal origin and believes that it has an external origin. Examples of this mechanism in an excessive degree are found in the mental malady known as paranoia (q.v.), in which the suspicions of the individual, having a purely subjective origin, are projected upon the external social environment. The paranoiac believes that he is a great man, taking his belief from the grandiose thoughts which occur to him as a compensation [see below] for an unconscious feeling of *inferiority,* and he views external reality more and more as conspiring against him to prevent the realization of his wishes for superiority. It is true that all individuals give evidence in thought and act of both introjection and projection, but it is only when these mechanisms are unduly developed that the discrepancy between the unconscious wish and the actuality become such as to render the individual obnoxious. All healthy adults identify themselves with parts of their environment to some extent, as with their possessions and with the members of their family and of their social milieu, but such identification is productive of good both in action and in thought. It should not, however, be allowed to go too far, and a rigorous critique should be exercised by comparison with real things in order to prevent excess.

Compensation is that mechanism of the unconscious which secures an activity sometimes quite the opposite from that found to be the goal of the unconscious wish. For example when a person shows an extraordinary interest in antivivisectionism or the prevention of cruelty to children or to animals, it is frequently discovered upon analysis that this form of activity is a compensation for an unconscious sadism or desire to inflict cruelty. Lynching, which ostensibly aims at the punishment of an offender, is in reality mediated through an unconscious desire to inflict cruelty or to see it inflicted. Much of the action of extravagant chivalry is also an illustration of an unconscious desire to indulge in acts of cruelty. This is an apparent contradiction, but numerous analyses have shown the truth of this statement. The fact that a conscious and an opposing unconscious wish are satisfied both at the same time makes the compensation all the more ambiguous. That is, the individual consciously believes that he is satisfying only the wish to *right* a wrong, not being conscious of the fact

that in taking especial pleasure in righting a wrong, he is unconsciously satisfying a wish to occupy his mind with the *wrong* itself. It is not known to the militant suffragette that her conscious desire to arrogate to herself the privileges of *men* is a compensation for an unconscious desire to be dominated by a *man.* Compensation is a physiological mechanism, too, by virtue of which the function of one organ, say the kidneys, is taken over at times by that of another, for instance the skin, in excreting certain waste products. An aim is sought by nature and failing in attaining this aim through one avenue, she tries another. Similarly in the mental processes, the psyche is aiming constantly at the satisfaction of desire, and if it fails to get it consciously, it will get it unconsciously by compensation, that is, the desire of which the individual is not aware, though it may be fundamental in his psyche, will nevertheless gain its satisfaction in some substitutive form, through something which symbolizes in conscious life the object of the unconscious craving. A very infantile partial trend of the libido, (q.v.), namely, the child's desire to be looked at, is gratified by the actor in a domestic performance where he may be utterly unconscious of the fact that his primary desire is to exhibit his body but unconscious only of the fact that he wishes to represent a character for the edification of the public.

Rationalization is the constant tendency on the part of all people to give an *ex post facto* reason for their thoughts or acts. This is why "a man convinced against his will is of the same opinion still." The term rationalization was introduced into analytic psychology by Dr. Ernest Jones. If a person is hypnotized and during the hypnotic sleep is told by the hypnotizer to do something when he wakes up, such for instance as putting a chair on a table, he will do so, and when he is asked to give a reason for this act, he will fabricate a wrong one, because he does not know the right cause. The cause of his act was the hypnotic suggestion, and is perfectly well known to the hypnotizer. But to the hypnotized subject the cause is unknown as it is contained in his unconscious, and, having been given to him in his unconscious state, it does not emerge into consciousness. This is paralleled by almost every instance in which a reason is given for doing anything. The entire cause in the case of some persons is, as with the hypnotized person, in the unconscious, while with the majority of people a large proportion of the causes of all their actions is in their unconscious and is unknown to them. The reasons which people then give for their actions are termed rationalizations and the tendency of all persons to feel that they have to give reasons when they are asked for them is what is meant by rationalization. See also SYMBOLISM. Consult Hendrick, I., 'Facts and Theories of Psychoanalysis' (1939); Jelliffe, Smith Ely, 'Sketches in Psychosomatic Medicine' (1939).

MECHANOTHERAPY, treatment of disease by mechanical means or exercise. See MASSAGE.

MECHITARISTS, mĕk-ĭ-tăr'ĭsts, a sect of Armenian Christians acknowledging the authority of the Pope, but retaining their own ritual. The name originated from Mechitar Da Petro (1676–1749), who in 1701 founded a religious society at Constantinople for disseminating a knowledge of Armenian literature. They soon removed to the Morea, whence in 1715 they went to Venice, and later to the island of San Lazzaro. There are branches of the sect in Vienna and elsewhere. At Venice its printing presses have turned out the best works in Armenian literature, and a periodical which has a large circulation. Consult Boré, *Le couvent de Saint Lazare à Venise, etc.* (Paris 1837).

MECHLIN (Dutch: Mechelen; French: Malines), the Catholic archiepiscopal see of Belgium, a city in the Antwerp Province. The origin of the town goes back to 870 when it was first mentioned in the Treaty of Meersen. It owes its existence to an abbey and small inland port. In the Middle Ages, it acquired several trade monopolies for a large region: salt, fish, and wheat had to be stored and sold there. Drapery was a prosperous industry. Under the rule of Charles V and Philip II, it became the seat of government, and an art center developed under the impulse of the rulers. Several great architects of international renown in the 15th and 16th centuries came from Mechlin.

In 1949, its main industries were tapestry weaving and the manufacture of hand-carved furniture. It is also the seat of an unique institution, the only school for carillonneurs in the world, founded by Jef Denijn. Its outstanding monument is the Cathedral of St. Rombaut (13th century) which contains an excellent carillon and the tomb of Cardinal Mercier, famous defender of Belgian liberties in World War I.

Among the most famous artists the town produced are the painter Frans Hals, the sculptors Luc Faid'herbe, Théodore Verhaeghen, and Ernest Wijnants. The cathedral choir is exceptionally well conducted by the scholarly Canon Van Nuffelen.

Mechlin suffered a disastrous air attack during World War II. Pop. (est. 1949) 61,994.

MECKLENBURG, mĕk'lĕn-boorg, Germany, a territory on the Baltic Sea, a former Saxon province, now divided into the republics of MECKLENBURG-SCHWERIN and MECKLENBURG-STRELITZ.

(1) Mecklenburg-Schwerin, bounded on the north by the Baltic Sea, elsewhere chiefly by Prussia and Mecklenburg-Strelitz, has an area of 5,066 square miles. The capital is Schwerin. Mecklenburg-Schwerin is watered by several rivers, most important of which are the Elbe and its tributaries, the New Elde and the Sude, on the southern border, the Warnow, the Recknitz and the Stepenitz, which flow toward the Baltic. There are many lakes and ponds, the largest of which are the Müritz See (51 square miles), the Schweriner See (23 square miles), the Kölpiner and the Plauer See. The country is generally flat, though here and there intersected by low ranges of hills, and its surface is extensively covered with wood. Near the sea

are large tracts of sand and morass. The climate, though raw, is mild and healthful; the average temperature throughout the year is 46° and the precipitation is 21 inches.

The principal industries are agriculture, dairying and stock-raising. About 50 per cent of the population are tillers of the soil. The landholders were formerly hereditary tenants of the peasant class, title being vested in the upper classes, as the emperor or the aristocracy. The chief crops are wheat, rye, oats, barley, corn, pease, beans, beets, turnips and potatoes, and tobacco is cultivated to some extent. The principal manufacturing industries are foundries, machine shops, brick yards, tanneries, paper mills, sugar refineries, breweries, distilleries, tobacco factories, etc. There is considerable commerce through Warnemünde (Rostock) and Wismar. The railway mileage is 1,094 miles. The predominating form of religion is the Lutheran. Besides the university at Rostock there are several gymnasia and numerous burgher, parochial and other schools. Under the Empire the two Mecklenburg duchies had a common assembly or Landesunion, consisting of the representatives of the landed aristocracy or Ritterschaft and the burgomasters of 49 towns, the tenants of the royal domains had no representation. The assembly met once a year, alternately at Malchin and Sternberg. The executive authority in Mecklenburg-Schwerin was vested in a cabinet of four ministers; there were also a permanent committee consisting of nine members at Rostock, who represented the two estates when the assembly was not in session, and deputation and convocation diets, which might be assembled upon special occasions and for special purposes. Mecklenburg-Schwerin had two votes in the federal council and six representatives in the Reichstag, the only elective offices. Each duchy had a separate system of lower courts but they had a Supreme Court at Rostock in common. There was no general financial budget for Mecklenburg-Schwerin; there were three entirely distinct systems of finance. The budget of the first system was called the administration of the sovereign; the second, the states administration and the third, the ordinary budget of the common administration. The Constitution of the Republic is dated 17 May 1920. Technical education is well advanced and higher education is provided for by the University of Rostock. Pop. (1925) 674,411.

(2) Mecklenburg-Strelitz, divided by Mecklenburg-Schwerin into two large districts, the province, under the empire, of Stargard, and the province of Ratzeburg, both on the east, and on the west in several smaller districts, existing in separate patches, has an area of 1,131 square miles. Pop. 110,371, capital Neustrelitz. The country is flat and similar in physical characteristics to Schwerin. Under the Empire Strelitz had one joint representative chamber with Schwerin, but Ratzeburg was not included in these estates and was governed directly by the grand duke. The grand duke gave Ratzeburg a representative constitution 1869. Mecklenburg-Strelitz had one vote in the federal council of the empire and one representative in the Diet. Consult Raabe, W., 'Mecklenburgische Vaterlandskunde' (3 vols., Wismar 1896).

MECKLENBURG (měk'lĕn-bĕrg) **DECLARATION,** in American history, a series of rebellious resolutions adopted 20 May 1775, at Charlotte, Mecklenburg County, N. C., by a convention held at midnight and representing each militia company in the county. The resolutions declared that the people of Mecklenburg County were free and independent of the British Crown, and not only was the general tenor that of the Declaration of Independence, but many phrases in the resolutions are word for word as they appear in that document. The minutes of the midnight meeting are said to have been destroyed by fire in 1800. Whether the Declaration of Independence followed the words of the Mecklenburg Declaration, or whether the latter, having probably been replaced from memory, was tinctured with the former, is a disputed question. In 1831, the day of 20 May was made a legal holiday in North Carolina. Consult Cooke, 'Revolutionary History of North Carolina' (1853); Draper, 'The Mecklenburg Declaration' (1874); Graham, G. W., 'The Mecklenburg Declaration of Independence, May 20 1775,' and 'Lives of its Signers' (New York 1905); Hoyt, W. M., 'The Mecklenburg Declaration of Independence' (ib., 1907); Moore, J. H., 'Defense of the Mecklenburg Declaration of Independence' (Raleigh 1908).

MECONIC ACID, an organic acid occurring in opium and having the formula $C_5HO_3(OH)(COOH)_2$. In preparing it, the opium is exhausted with water at 100° F., the infusion is neutralized with calcium carbonate and evaporated to a syrup, and calcium meconate is precipitated by adding a concentrated solution of calcium chloride. Two crystallizations from hot dilute hydrochloric acid follow, and the free acid is then deposited in the form of small scales, containing three molecules of water. Upon heating to 212° F. the hydrated crystals lose their water, and become white. Meconic acid is readily soluble in alcohol, but only slightly so in ether and in cold water. It has a sour taste and a pronounced acid reaction, and its solutions are turned red by ferric chloride, $FeCl_3$. Meconic acid forms numerous salts («meconates»), as well as various organic derivatives; but none of these is of importance in the arts.

MEDAL, a piece of metal in the form of a coin, cross, or star, stamped with the portrait of an eminent person or with an inscription commemorating a famous action or event, and not to be circulated as money. Medals belong to two periods, ancient and modern, separated by a wide interval. Early Greek and Roman medals were struck for prizes in athletic games, or in commemoration of great events. The Roman series of medals or medallions is very extensive in gold, silver and brass or copper. The gold medals begin with Constantine and continue to the fall of the empire; the silver begin under Gallienus and continue as long; the copper from Augustus to Alexander Severus.

In more modern times the art of medal-making has been brought to great perfection, and most of the principal nations have adopted the plan of preserving their history by these durable monuments. The French series is deserving of special mention as the most perfect and complete in the world. It commences under Louis XI and continues to the present date, illustrat-

ing every important event in the history of France. The English series commences under Henry VIII, but as works of art the medals have not high rank. The British battle medals, however, form an admirable series.. The Italian and German medals of modern date are very fine. The mediæval are interesting and bold in design, but rude in execution. The papal series, commencing with Paul II, are worthy of attention.

One of the earliest American medals is that presented to Gen. John Armstrong for his successful attack in 1756 on the Indians at Kittanning. Most of those struck during the Revolution were made in France. The next American medal of which there appears to be any record is that which was presented to General Gates after the surrender of Burgoyne, 17 Oct. 1777. On 25 March 1776, when news of the British evacuation of Boston reached Congress, that body resolved that its thanks be presented to the Commander-in-Chief, and that a gold medal be struck in commemoration of the event. This medal was nearly two and three-quarters inches in diameter. On one side was a profile head of Washington, with the legend in Latin: "The American Congress to George Washington, the Commander-in-Chief of its armies, the asserter of freedom." On the reverse the device showed troops advancing toward a town, others marching toward the water, ships in view, General Washington in front, mounted, with his staff, whose attention he is directing to the embarking enemy. The legend is: "The enemy for the first time put to flight." Then, too, at the time of his death, among minor honors paid to the great general's memory, was the publishing of a silver commemorative medal.

There is the record of one medal only granted by Congress in commemoration of any naval victory during the War of the Revolution, and that was a gold one presented to Paul Jones for his defeat of the British frigate *Serapis* when commanding the *Bonhomme Richard*, 23 Sept. 1779. Other gold medals were those presented to Commodore Perry and Lieutenant Jesse D. Elliot for the part which they took in the battle of Lake Erie, 8 Oct. 1812; to Captain Lawrence, who, in command of the *Hornet*, 24 Feb. 1813, captured the British brig *Peacock*; to Captain Warrington of the *Peacock*—then under the Stars and Stripes—for the capture of the *Epervier*, 20 April 1814; to Capt. Thomas Macdonough, who commanded the American squadron in Plattsburg Bay, August 1814; to Captain Decatur, who, in command of the *United States*, captured the British frigate *Macedonian*, 25 Oct. 1812; and to Captain Jones and Captain Blakely, who, when commanding the *Wasp*—the one, 12 Oct. 1812, and the other 28 June 1814—captured respectively the *Frolic* and the *Reindeer* from the British navy.

The giving of medals went out of fashion after the second war with Great Britain, and but little was done by the government during the War of the Rebellion. Maj. Robert Anderson received two medals for his gallant defense of Fort Sumter, but one was presented by the citizens of New York and the second by the Chamber of Commerce of the same city. After the successful operations by Grant in East Tennessee and at Chattanooga, Congress voted him thanks and a gold medal with suitable emblems, devices and inscriptions. It is worthy of remark that no less than 189 medals were struck in honor of Abraham Lincoln, and later medals have been issued in memory of Garfield and McKinley, and in honor of Sampson, Schley, Dewey and others in the Spanish-American War. (See also COINAGE; NUMISMATICS; TOKEN MONEY). Consult Hawkins, 'Medallic Illustration of the History of Great Britain and Ireland' (London 1885); Loubat, J. F., 'Medallic History of the United States' (New York 1878); Leduc, 'Histoire des décorations en France' (Le Mans 1890); Hill, G. F., 'Portrait Medals of Italian Artists of the Renaissance' (New York 1912).

MEDAL OF HONOR, United States Military, an honor bestowed upon army and navy officers and men for specific services; regarded as a higher token of the war hero than the Victoria Cross of England, the medal of the Legion of Honor of France, or the Iron Cross of Germany. It is given not for the sheer performance of duty, no matter how hazardous that duty may be, but for some voluntary act of valor, beyond the bounds of mere obedience to orders. Out of the millions of men who have battled for the United States in the different wars this country has had, the vast majority, as history shows, performed their duty. Of these, however, have been about 2,000 men who have done more, who have braved dangers when they were not expected to brave them, overcome difficulties that were regarded by the rest as insurmountable, and faced death when it seemed it meant the sacrifice of their own lives. Many are the ways these medals have been won. By the Act of 12 July 1862 the United States government authorized the striking of 2,000 medals to be given to non-commissioned officers and privates for gallantry in action and soldier-like qualities. On 3 March 1863 the sum of $20,000 was appropriated for making the medals, and officers were made eligible to receive them. Medals were also authorized by Congress in recognition of acts of bravery performed during the World War and the war with Spain in 1898 (in the naval battles of Manila and Santiago, the Manila medals bearing the portrait of Admiral Dewey, and the Santiago medals a portrait of Rear-Admiral Sampson). The medal is a bronze five-pointed star within a circle suspended from a cross bar inscribed with the word "Valor" and surmounted by an eagle, united by a ribbon of 13 stripes of red, white and blue. Consult Rodenbough, 'Uncle Sam's Medal of Honor' (New York 1886), and 'United States Army Regulations' (latest issue).

MEDAL OF HONOR LEGION, an association of officers and enlisted men of the United States army, who were awarded medals of honor for special acts of bravery and devotion. At first limited to participants in the Civil War, it was subsequently extended to all medal holders. The association has altogether about 400 members among the army veterans and among naval veterans. The meetings are held annually.

MEDALLION, mē-dăl'yŏn. (1) The term medallion in numismatics is applied to those productions of the mint of ancient Rome, or struck in the provinces under the empire, which, if gold, exceed the *aureus* in size; if silver, the *denarius;* and if copper, the first or large brass. Medallions are not numerous. Those struck in

the Greek provinces are more common than the Roman, but of inferior workmanship. A beautiful and famous gold medallion exists of Augustus, and one of Domitian, but few, in any metal, are found prior to the reigns of Hadrian and Antoninus; those in brass are the largest, many of them being several inches in diameter, and for the most part of admirable workmanship. (See MEDAL).

(2) In architecture, an oval panel carved in bas-relief, usually carrying a head or figure. The same term is used for a color design.

MEDANO, mā-dä'nō, the Spanish name for peculiar moving sand-hills in Peru. They are seen on the plain of Islay near Arequipa, and are crescent-shaped bodies of white sand, which move across the desert in the direction of the winds which blow from sunrise to sunset. The sand composing the *medano* seems different from the desert sands over which the moving mass is blown or carried.

MEDARY, Samuel, American editor and politician: b. Montgomery Square, Montgomery County, Pa., 25 Feb. 1801; d. Columbus, Ohio, 7 Nov. 1864. In 1825 he settled at Batavia, Clermont County, Ohio, and in 1828 established the *Ohio Sun* in support of Jackson's candidacy for the presidency. He sat for Clermont County in the State house of representatives in 1834–35 and was a member of the State senate in 1835–37. In 1837 he purchased at Columbus the *Western Hemisphere,* later the *Ohio Statesman,* which he edited until 1857. In 1857–58 he was governor of Minnesota Territory and in 1858–59 of Kansas Territory. He was named Minister to Chile in 1853 but declined. He established the *Crisis* at Columbus in 1860, and was its editor until his death. He gave active aid to Morse in the promotion of the electric telegraph, was a firm supporter of the measures of Jackson and Douglas; is said to have originated the battle-cry "Fifty-four forty, or fight!" in connection with the Oregon boundary dispute, and was often called the "old wheel-horse of Democracy." There is a monument to his memory at Columbus, Ohio.

MEDEA, mę-dē'ą, a powerful sorceress of the Greek heroic age, daughter of Æetes, king of Colchis. By some her mother is said to have been Idyia, daughter of Oceanus; by others Hecate or Neæra. By her profound knowledge of the magical virtues of plants she practised witchcraft. She became the wife of Jason (q.v.), the leader of the Argonauts. For 10 years she lived with him after having supported him in every danger, till the charms of Glauce, or Creusa, the daughter of King Creon, kindled a new passion in him, and he discarded Medea, who brooded on revenge. With this purpose she sent the bride, as a wedding gift, a poisoned garment, also a poisoned crown of gold, which Glauce put on and died in agony. The sorceress reduced Creon's palace to ashes by a shower of fire, murdered her two children by Jason and then mounted her dragon chariot and escaped. Some say that she went to Hercules, others to Athens, to King Ægeus, by whom she had Medus. From Athens also she was banished as a sorceress. She finally returned to her home, where her son Medus reinstated her father, who had been dethroned by his brother Perses, after which she died. The story of Medea has often been a subject of tragic poetry ancient and modern. The tragedies of this name, by Æschylus and Ennius, have perished, as well as the Colchides of Sophocles. The Medeas of Euripides and Seneca are alone extant. The story has also been dramatized by Corneille and Grillparzer. Cherubini made this myth the subject of an opera. Consult Lübker, F., 'Reallexikon des plassischen Altertums' (8th ed., Leipzig 1914), and Mallinger, Léon, 'Médée étude sur la litterature comparée' (Paris 1898).

MEDEA, The, a play of jealousy and revenge, in which the interest is sustained from the beginning to the very end, and is artistically almost without a flaw, was brought out by Euripides in 431 B.C. Few tragedies of ancient or modern times are more dramatic. None exhibit the working of a fiercer and more intense passion. With the 'Hippolytus' it forms the double summit of the poet's works, and probably no Greek tragedy has been more famous in the modern world. The great enchantress, who fell in love with Jason when he came to Colchis in quest of the Golden Fleece, escapes with Jason to Greece, and lives happily with him for many years. Later Jason and his barbarian princess are obliged to flee to Corinth. In this city the scene of our play is laid. The old nurse speaks the prologue: Jason has deserted his wife for the daughter of Creon, king of Corinth. Dishonored, forsaken, the hapless woman sits brooding. The pædagogus enters and reports a conversation he has just overheard: Creon proposes to banish Medea. Medea is heard bemoaning her fate: oh, that she had never listened to the smoothing words of the deceitful Greek. Embittered, she imprecates curses on Jason and her children and prays that the whole house may be blasted to naught. Then she comes out and explains her position to the Corinthian women, who form the chorus. Creon enters and orders Medea to get her gone. She dissembles: the king is mistaken in believing that she is dangerous — she is simply hot with hate against Jason. "Let me remain — I shall yield to the stronger hand and hold my peace." The king reluctantly consents for her to remain one day. A great change comes over the woman scorned after Creon's departure: "I would not have groveled so before him except to get revenge. I shall bide my time, find first a safe refuge, then compass their destruction in secrecy by craft. Till then, my soul, sit still. By the Queen of Night that habits my hearth's dark shrine, no one shall ever vex my soul with impunity."

The chorus sing: "the old order is upturned; piety and fear, religion, justice, truth, loyalty all decline to their contraries, and naught but confusion lives." Jason appears and upbraids his wife for her froward spirit; she may rail at him, but not against the king. He had tried to appease the incensed ruler, but she persisted in her folly. But he will not desert her even in this dire extremity. "O most pernicious and perfidious man! You front me, you, the most hateful, insolent wretch on earth? But I am glad you came, for I shall tell you what you are, that you may chafe and wince.— I saved you, slaying the dragon and delivering you from death. I abandoned my home and followed you. Yet now you forsake me, the mother of your children. A loyal

spouse I have in you! I, a poor lorn woman, with her two babes, a fine reproach for our newly wedded prince!" Jason feels that he must be a skilful pilot to run before the wind of her loud words; but he declares that she received more than she gave, for she lives in a good Greek land, where law and justice reign — she is no longer an obscure barbarian. He had her welfare at heart when he contracted the new alliance. Women are so unreasoning that they know not where their fortunes lie. Jason withdraws and the chorus sing a song on the power of love. King Ægeus of Athens enters. He promises to protect Medea, if she comes to his city seeking refuge. Then she sends for Jason and asks his forgiveness for the rash words spoken in angry mood: "Ho, children, come forth and welcome your father with me." But the thought of their impending death, when she beholds her babes, is too much even for Medea's iron courage. The tears force themselves to her pitying eyes. In explanation of her weakness she tells Jason that she is a woman, naturally born to tears, prone to weep, subject to fears: her heart melted at the thought of reconciliation. Jason has naught but praise for her altered mood; may his children grow to manhood triumphant o'er his foes. Medea weeps. Jason asks her why she turns her face away and hears not with joy his benisons. "'Tis nothing—I bore them, bred them, loved them, and when you prayed that they might live, I wondered whether this would come to pass." She begs Jason to intercede for her children and allow them to remain in Corinth — she will send his bride royal gifts. The children carry the presents in a casket to the palace. The chorus sing an ode and the pædagogus enters to inform Medea that the children may remain. "Be of good comfort, thy children will yet bring thee back home." "Nay, I shall first send others home. Alas! O children, you have a home, but I go to another land, just when I begin to feel that I am blest in you. Out upon my daring! 'Twas all for naught I toiled for you, my children. Ah, the fond hopes that your dear hands would minister to my wants and when I die put the shroud around me. Oh, why do you look at me thus? My heart is unequal to the task. My babes' bright morning faces unnerve my arm. I *cannot* do it. I will take my children with me. Why, to wring their father's heart, give my own a double pain? But am I to be mocked? Shall I let my foes go unpunished? I *must* do it. Out upon my cowardice! Go in, children. Nay, my heart, let them live; spare the tender babes, my unblown flowers, my life, my joy, my all the world. No, by the avenging deities, I will not give up my children to my foes. But I must see them before I go. O my darlings! O sweet mouth and form and face, sweet kiss, sweet embrace! O balmy breath and tender touch of your delicate cheeks! Go in, go in. I can look no longer, I faint." The chorus sing an ode on the comparative benefits of having children and having no children. A messenger enters: "when your children entered the palace we were all glad. The rumor spread that you were reconciled." One kissed the hands of the children, the other their golden hair. The princess sat with fond look on Jason; but when she espied the pair, she pulled down her veil and turned away in scorn. Jason entreated her to allay her wrath: "Accept these gifts and ask your father to remit the doom of exile, for my sake." And when she saw the splendid gifts, she granted her lord's desire. Then she took up the robe — after they had gone — and tried it on. The golden crown she placed upon her head and arranged her hair before a mirror. Then she rose and walked about the room, stepping lightly with delicate foot and glancing oft toward the lowest folds around her ankle. Suddenly a ghastly spectacle presented itself. A pallor spread o'er her face. Back she tottered all a-tremble, and barely reached her couch before she fell, frothing foam around her lips, her eyeballs rolling wildly. One servant darted to her father's chamber, another flew to call the bridegroom. The hapless girl lay full a minute speechless. Then she roused and gave forth a scream, for a double agony had charged upon her: from the inclusive verge of golden metal around her brow a marvelous stream of fire shot forth, while the robes began to eat her delicate flesh. Up she started and sped across the room, a pillar of fire, shaking hair and head in vain endeavor to cast off the crown. But firm it held. Whene'er she shook her locks the flames started up twice as high and fierce. O'erwhelmed she sank upon the floor, past recognition save to a parent's eye: the clear calm look was gone, the comely features marred, drops of intermingling fire and blood dripped from her head, while gobbets and flakes of flesh dropped from her bones, like tears of resin from the pine, as those unseen jaws of the poisonous drug fed on her form. All feared to touch the corpse. Suddenly her father entered. He knelt and clasped her in his arms: "Oh, my poor child, what god brought thee to this cruel death?" At last he stayed his tears and tried to raise his old bent form, but the robes did cling to him as the ivy to the laurel. He writhed upon his knees and tried to wrench himself away, but only pulled the flesh from off his bones. At last the ill-starred sire gave up the ghost. Now their corpses lie side by side, a spectacle to draw tears of pity from the eye. Medea informs the chorus that she must slay her children and hasten away: "Now, my heart, put on thy armor for the deed. Shrink not. Think not on the happy days agone. For this one brief day forget thy children — e'en if thou dost slay them, they are most dear, and I the most unhappy woman in the world." Medea enters the house and soon the screams of the children are heard within. Jason enters and asks for Medea; he feels anxious for his children — the king's relatives may do them hurt. "Wretched man, your children are dead, slain by their mother's hand." Jason is overwhelmed. He orders the gates to be unbarred. Medea appears aloft in a chariot. Jason asks for the bodies; but she refuses to give them up: she will take them and bury them herself, that her foes may not demolish the grave. She intends to go to the land of Erechtheus to live with Ægeus. She prophesies that Jason will die most miserably, struck on the head by a piece of fallen timber from the Argo. She soars away, and Jason calls on Zeus to witness the treatment he has received at the hands of the tigress. Thus the play, in which we see the perfection of Euripides' art.

ends. The fury of her vengeance is as the love of Phaedra in the *Hippolytus;* but instead of overwhelming her soul, it excites to action, arms it against the deepest instincts of mother-love and makes it triumph over everything in a kind of grandiose and savage egoism. The more impetuous the fury, the more pathetic the struggle of feminine instincts. In no other play is there anything more characteristically Euripidean than Medea's celebrated monologue. Next to the human passions it is the natural affections, the tenderness of parents for their children, the love of brothers and sisters, of husband and wife, that Euripides portrays best.

JOSEPH E. HARRY,
Author of "The Greek Tragic Poets."

MEDELLIN, mā-thâ-yēn′, city, Colombia, the capital of the Department of Antioquia, and an episcopal see, picturesquely situated in a mountain valley 4,850 feet above sea level on the Porce, an affluent of the Canca, 150 miles northwest of Bogotá. From it radiate several highways and airlines.

It was founded in 1674 and has a cathedral, college, seminary, technical school, mint, hospital and other public buildings. The development of the gold and silver mines in the region has contributed largely to its modern progress.

It has manufactures of pharmaceuticals, chemicals, electric appliances, foodstuffs, pottery, porcelain ware, cloth, candies, cigarettes, clocks, shoes, paper, and jewelry and has a considerable trade, exporting gold, silver, coffee, and hides. Pop. (1938) 143,952.

MEDFIELD, town, Massachusetts, in Norfolk County; altitude 179 feet; 19 miles southwest of Boston; on the New York, New Haven and Hartford Railroad. It is a residential suburb. The public library houses historical relics. Medfield was settled and incorporated in 1651. Pop. (1950) 4,549.

MEDFORD, city, Massachusetts, in Middlesex County; altitude 12 feet; on the navigable Mystic River; 5 miles northwest of Boston; terminus of a branch of the Boston and Maine Railroad from Boston; and, through West Medford, on the Lowell division of the same railroad. A residential suburb of Boston, it has important manufacturing interests. Among its products are machinery for cutting shoe soles; wax and polishes; waterproofed textiles, and valves.

Medford's public library has a collection of autographed letters of George Washington. The city's educational facilities include a standard public school system and Tufts College (q.v.), which has, in cooperation with Harvard University, the Fletcher School of Law and Diplomacy, training students for government service and participation in the management of international relations. Lawrence Observatory, which rises to a height of 310 feet above sea level, affords a view of the surrounding country. In its early days Medford was famous for rum and ships.

Shipbuilding began here in the first years of the nineteenth century, and prospered until the early 1870's. The distilling of rum at Medford ceased very soon after 1900. In the pre-Revolutionary War years Medford was a source of supplies for New Hampshire and Vermont. It was a city of merchants. Medford-built ships engaged in the China trade, and made fast voyages around the Cape to California.

Medford first known as Meadford, was settled in the 1630's; incorporated as a town in 1684, and made a city in 1892. Its government is administered by mayor and council. Pop. (1940) 63,083; (1950) 59,714.

MEDFORD, city, Oregon, and Jackson County seat; altitude 1,377 feet; on the Southern Pacific Railroad; 206 miles south of Eugene; has an airport with airline service. Situated in the Rogue River Valley, it is the center of a fruit growing, dairy farming, lumbering, and mining region. It is also a summer resort. Near by is Rogue River National Forest, and the city is connected by highway with Crater Lake National Park. From 1900 to 1910, as the fruit industry developed, Medford grew from a town of less than 2,000 to a city of more than 8,000. It has mayor and council, and city-owned water system. Pop. (1940) 11,281.

MEDFORD, city, Wisconsin, and Taylor County seat, altitude 1,414 feet, on the Black River and the Minneapolis, St. Paul and Sault Ste. Marie Railroad, 79 miles northeast of Eau Claire. Principal occupations are dairying, mill-working hardwoods, and canning. The city has a mayor and council, and owns its water supply. Pop. (1950) 2,799.

MEDHURST, mĕd′hĕrst, **Walter Henry,** English oriental scholar and missionary: b. London, 1796; d. there, Jan. 24, 1857. He was educated for the ministry and in 1816 made a missionary tour through India and Malacca, establishing himself in 1822 in the island of Java, where he remained eight years. During this interval and for several years afterward he pursued his missionary labors there, in Borneo and on the coasts of China. In 1843 he settled in Shanghai and subsequently passed six years in the interior of China. He was an accomplished student of the languages and literatures of eastern Asia, being well versed in the Chinese, Japanese, Javanese and other dialects, besides Dutch, French and English, in all of which he wrote. Besides a Chinese version of the Bible, he published *English and Japanese Vocabulary* (1830); *Dictionary of the Hokkien Dialect* (1832–1839); *Translation of a Comparative Vocabulary of the Languages of China, Corea and Japan* (1835); *China in its State and Prospects* (1838); *Chinese Repository,* 20 vols. (1838–1851); *Notes on Chinese Grammar* (1842); *Chinese Dialogues* (1844); *Dissertation on the Theology of the Chinese* (1847); *English and Chinese Dictionary* (1847–1848).

MEDIA, mē′dĭ-ȧ, Asia, an ancient kingdom and country of considerable extent, now comprised in the provinces of northwest Iran. It was originally inhabited by a Turanian race, who are called Medes by ancient writers; but this name properly belongs to an Aryan race, who had spread themselves widely in the high regions of Western Asia and ultimately established their ascendency in Media. They have been traced both by Persian and Indian traditions to the countries beyond the Indus. The history of Media is involved in considerable obscurity, but careful modern investigations have made the main outlines fairly clear. The Medes are first mentioned

in connection with some of the kings of Assyria from the 9th century B.C. The Assyrian conqueror Shalmaneser II in 836 B.C. received tribute from those of the Zagrus area. In 713 the great King Sargon II (722–705 B.C.) conquered the country and made the Median princes tributary to the Assyrian monarchy. According to the Assyrian inscriptions, one of the Median rulers named Dayukku (Dajaukku) was carried off as a prisoner in 715 B.C.; this Dayukku is the same as the Deioces who, according to Herodotus, founded the Median kingdom on an independent basis and fixed his capital at Ecbatana (now Hamadan). Deioces was followed by three kings in succession, bearing the names (in Greek) of Phraortes (647?–?625 B.C.), Cyaxares (625–585 B.C.) and Astyages (584–550 B.C.).

Phraortes, to whom the Greek historian assigns a reign of 22 years, began the extension of the Median empire by the subjugation of the mountainous region of Persis, to the southeast of Media. He then conquered other parts of Asia, and at length ventured to take the aggressive against the Assyrians and attack Nineveh. In this attempt he failed and lost his life.

Cyaxares succeeded him on the Median throne, and during a reign of 40 years raised his kingdom to the greatest power and importance it was destined to achieve. He thoroughly reorganized the army and advanced against Nineveh. He gained several successes, but before he could take the Assyrian capital he had to return to defend his kingdom against the inroads of Scythians. At first the Scythians carried all before them and became virtually masters of Media, but Cyaxares temporarily secured his position by negotiating with them, and finally slew all their chiefs when they were overpowered by wine at a feast. Thus rid of Scythian authority, Cyaxares again advanced against the Assyrians. In conjunction with Nabopolassar, founder of the Neo-Babylonian empire, he captured Nineveh about the year 606 B.C. After this event the Assyrian dominions were partitioned between the two conquerors, the northern parts falling to Media and the southern portions to Nabopolassar. Nebuchadnezzar, son and successor of Nabopolassar, married a daughter of Cyaxares. Cyaxares carried his arms into Asia Minor and waged war for five years against Alyattes, king of Lydia. On May 28, 585, the Median and Lydian forces were engaged in battle when a total eclipse of the sun took place and struck terror into the soldiers on both sides. This event disposed both sides to enter into peace negotiations, which were successfully carried through by the agency of Nebuchadnezzar and Syennesis, prince of Cilicia. Cyaxares probably died very shortly after this event, and left to his successor a greatly extended empire.

Astyages was the last independent king of Media, and from 550 B.C., when he was conquered by Cyrus the Persian, Media formed part of the Persian empire. See PERSIA-IRAN—*History*.

MEDIA, borough, Pennsylvania, county seat of Delaware County; on the Philadelphia, Baltimore and Washington Railroad, about 15 miles west of Philadelphia. It is a well-built, well-kept residential suburb of Philadelphia, and is situated in a fertile agricultural region. It is the headquarters for the Delaware County Institute of Science, established in 1833. The Institute has a library of about 5,500 volumes, and the borough library has about 3,500 volumes. The street-lighting plant and the waterworks are owned and operated by the borough. The borough was incorporated in 1850; its government is vested in a burgess and council. Pop. (1940) 5,351; (1950) 5,733.

MEDIAL MORAINE. See MORAINE.

MEDIATION, *in international law,* is the friendly intercession of a third power or powers with a view to bringing about the settlement of a controversy between two or more states, to avert threatened hostilities between them or to bring to a close a war in which they are engaged. Most writers on international law make a distinction between "good offices" and "mediation." The employment of good offices by a third power consists in the tendering of friendly advice or the offering of suggestions to the disputing parties with a view to bringing about the settlement of a dispute or the conclusion of peace, if they are engaged in war. A government which tenders its good offices is understood to be willing to suggest a compromise as a common basis of agreement between the contending parties, to arrange preliminaries for the negotiation of a treaty of peace and to do anything else that may serve the parties in settling their controversy or in ending their hostilities.

Mediation, on the other hand, has more of the character of friendly intervention. A mediator assumes the rôle not merely of adviser or conciliator but takes the part of a middleman,—usually the leading part,—in the conduct of the negotiations between the disputants. He is not, however, a judge, for mediation is not arbitration, nor is he an advocate for either side but, to use the language of Sir James Mackintosh, he is "a common friend, who counsels both parties with a weight proportioned to their belief in his integrity and their respect for his power." With a view to encouraging a more frequent recourse to mediation as a means of settling international controversies and in order to define the rôle of the mediator the Hague Peace Conferences of 1899 and 1907 adopted the following rules which were embodied in a convention which was ratified by practically all the powers of the world.

"In case of serious disagreement or dispute, before an appeal to arms, the Contracting Powers agree to have recourse, as far as circumstances allow, to the good offices or mediation of one or more friendly Powers (Art. 2).

"Independently of this recourse, the Contracting Powers deem it expedient *and desirable* (the italicized words were added in 1907) that one or more Powers, strangers to the dispute, should, on their own initiative and as far as circumstances may allow, offer their good offices or mediation to the States at variance.

"Powers, strangers to the dispute, have the right to offer good offices or mediation, even during the course of hostilities.

"The exercise of this right can never be regarded by either of the parties at variance as an unfriendly act (Art. 3).

"The part of the mediator consists in reconciling the opposing claims and appeasing the feelings of resentment which may have arisen between the States at variance (Art. 4).

"The duties of the mediator are at an end when once it is declared, either by one of the contending parties, or by the mediator himself, that the means of reconciliation proposed by him are not accepted (Art. 5).

"Good offices and mediation, undertaken at the request of the contending parties or on the initiative of Powers strangers to the dispute, have exclusively the character of advice, and never have binding force (Art. 6).

"The acceptance of mediation cannot, in default of agreement to the contrary, have the effect of interrupting, delaying or hindering mobilization or other measures of preparation for war.

"If mediation takes place after the commencement of hostilities, the military operations in progress are not interrupted, in default of agreement to the contrary (Art. 7)."

It will be seen that the tender of good offices or mediation by third powers prior to or during hostilities is declared to be a legal right, though not an obligation. The Convention, however, imposes on the disputants an obligation to have recourse to this mode of settling their controversies *so far as circumstances allow.* Each disputant is therefore the judge as to whether the circumstances in a particular case create an obligation to accept the offer tendered. At the outbreak of the European War the President of the United States made known his willingness to serve as a mediator whenever he should receive assurances that an offer would be acceptable by the warring powers. Again in 1916 when war between the United States and Mexico seemed imminent the governments of several of the Latin American republics made known their willingness to offer their good offices in bringing about a settlement of the dispute but the American government declared that the circumstances were not such as to make recourse to this form of sentiment expedient. The express declaration of The Hague Convention that the exercise of the right of mediation by third powers shall never be regarded by either of the disputing parties as an unfriendly act was designed to remove all possibility that an offer of mediation might be construed as an act of gratuitous interference rather than the act of a disinterested friend of both parties. The rôle of the mediator is defined in article 4 as that of reconciliation and article 5 lays down the circumstances when his mission is terminated. Article 6 which declared that mediation has no binding effect on the parties but is entirely advisory in character removes the possibility of further misunderstanding concerning its purpose and effect.

The historical instances of recourse to good offices and mediation are numerous. A few of these may be mentioned as illustrations. During the war of 1812 between Great Britain and the United States, the Tsar of Russia offered to act as a mediator with a view to bringing about a termination of hostilities. The offer was accepted by the government of the United States and to avoid delays plenipotentiaries were at once appointed by the President to conclude a treaty of peace but the offer was refused by the British government and nothing further came of the Russian proposal.

Early in 1861 several Latin American republics tendered their good offices to avert the civil war then imminent; after the outbreak of hostilities the British and French governments through their ministers at Washington expressed a willingness "to undertake the kindly duty of mediation" if the President should desire it. President Lincoln expressed appreciation for "this generous and friendly demonstration" but stated "that we cannot solicit or accept mediation from any, even the most friendly quarter." On various occasions during wars in South and Central America the President of the United States tendered his good offices to bring about the adjustment of difficulties or to terminate hostilities already existing. One of the most remarkable of such examples of mediation on the part of the United States was that which was begun in 1866 and concluded in 1872 for the purpose of terminating the war between Spain on the one hand, and the allied republics of Peru, Chili, Bolivia and Ecuador on the other. During the Franco-German War of 1870–71 France requested the United States "to join other powers" in an effort to bring about peace. President Grant replied that he anxiously desired to see the war ended and peace restored and that he would be glad to use his efforts in bringing about peace if Germany also desired the employment of his good offices. At the same time the French government was informed that it was the uniform policy of the United States not to act jointly with European powers in interference in European questions. During the Chino-Japanese War of 1894 the government of the United States made known to both belligerents its willingness "to contribute its kindly offices toward the restoration of peace" but when an inquiry was made asking whether the United States would be willing to join England, Germany, France and Russia in an intervention between China and Japan the President replied that the United States could not join the powers mentioned in such an intervention. During the Boer War of 1899–1902 the government of the United States alone of all the governments approached by the South African republics tendered its good offices but the offer was not acceptable to the government of Great Britain.

A remarkable recent example of the employment of good offices by the President of the United States to bring about the termination of war was the intervention of President Roosevelt in 1905 which resulted in the conclusion of peace between Japan and Russia. On 8 June 1905 the President caused identical notes to be sent to the governments of both belligerents expressing his wish that "the terrible and lamentable conflict now being waged" might be brought to an end and urging them "not only for their own sakes but in the interest of the whole civilized world to open direct negotiations with one another." He also expressed his entire willingness to do what he properly could if the two powers felt that his services would be of any aid in arranging the preliminaries as to the time and place of meeting of the plenipotentiaries which they might appoint. The suggestion of the President was promptly acted upon and plenipotentiaries were appointed to negotiate

a treaty of peace. They met at Portsmouth, New Hampshire, and a treaty of peace was signed on 23 Sept. 1905.

A still more recent example of successful mediation was that of 1914, which resulted in the temporary termination of an existing conflict between the United States and Mexico. On 25 April, the diplomatic representatives of Brazil, Argentina and Chile addressed a communication to the Secretary of State tendering the good offices of their governments for «the peaceful and friendly settlement» of the controversy. The offer was promptly accepted both by the President of the United States and General Huerta, President of Mexico, and both parties agreed to a mutual suspension of hostilities at the request of the mediators.

At the suggestion of the mediators commissioners representing both parties were appointed and they met at Niagara Falls, Ontario, in May 1914. The mediating plenipotentiaries in turn presided over the conferences. On 24 June a protocol embodying the terms of agreement was signed and it was duly ratified by both governments. JAMES W. GARNER,
Late Professor of Political Science, University of Illinois.

MEDICAGO, genus of leguminous plants common throughout the greater part of the globe and including such forage plants as alfalfa, medic and bur and mail clovers. Some species are annual, others perennial. In all here are about 50 species, of which about six are native to the United States. These include *M. sativa, M. lupulina, M. denticulata, M. Arabica.* In general the perennial species have violet flowers, the annuals small bright yellow flowers. The pods are single-seeded, curved and spineless in some, while in others it is spirally twisted, has spines on the edges and contains several seeds. Medicago sativa is the most important species, since it includes the valuable alfalfa and lucerne.

MEDICAL ASSOCIATION, American. See AMERICAN MEDICAL ASSOCIATION.

MEDICAL ASSOCIATIONS. Organizations of this general designation are very numerous and find their *raison d'être* in the desire of their members or founders to exchange information on professional subjects and to advance the status of the medical profession generally. In colonial America the early medical associations were organized as follows: Boston, 1735; New York, 1749; Philadelphia, 1765; New York, 1769; and others including New Jersey, 1766; Massachusetts, 1781; South Carolina, 1789; Delaware, 1789; New Hampshire, 1791; Connecticut, 1792. The leading association of this type, the American Medical Association (q.v.) was founded in 1847 for the advancement of medical science and the improvement of the public health. Medical specialist associations include the American College of Physicians, founded in 1915, the American College of Radiology, founded in 1924, and the American College of Surgeons, founded in 1913, the American Ophthalmological Association, the Congress of Physical Therapy, the American Gynecological Association, the American Heart Association, the American Laryngological Association, the American Laryngological, Rhinological and Otological Society, the American Psychiatric Association, the American Proctological Society, the American Psychoanalytical Association, the American Psychopathological Association, the American Public Health Association, the American Radium Society, the American Roentgen Ray Society, the American Society for Clinical Investigation, the American Society for Experimental Pathology, the American Society for the Control of Cancer, the American Society of Clinical Pathologists, the American Society of Tropical Medicine, the American Surgical Association, the American Therapeutic Society, the American Urological Association, the Association for Research in Nervous and Mental Diseases, the American Association for the Study of Allergy, the American Association for the Study of Internal Secretions, the Association of American Medical Colleges, the Association of American Physicians, the Association of American Teachers of the Diseases of Children, the Association of Military Surgeons of the United States, the American Association for the Study of Goiter, the American Society of Oral and Plastic Surgeons, the American Association of Obstetricians, Gynecologists, and Abdominal Surgeons, the American Association of Pathologists and Bacteriologists, the American Association of Industrial Physicians and Surgeons, the American Association of Railway Surgeons, and the American Association of Anatomists.

There are in addition several national associations which promote the interests of the medical profession in co-operation with the public. One of the best known of these is the Child Health Association. There are also state associations, county and municipal medical associations.

MEDICAL CODE, a set of regulations adopted by a medical association outlining the conduct of members of the profession. The various codes prohibit advertising in public prints, as well as the endorsement of proprietary or secret remedies. The ethics of both «regular» and homœopathic schools define the relations of patient and physician and of attending and consulting physician, and provide that a physician shall attend the immediate family of a brother physician without charge, except when unusual labor, expense or exposure is involved. The medical code in this country was founded on the English code of medical ethics prepared by Thomas Percival in 1803. In 1847 the American Medical Association adopted a general code which superseded codes existing in several States, and which was unopposed till 1882. In the latter year a majority of the members of the New York County Medical Society voted to disobey the provisions of the code which forbade them to consult with any but «regular» physicians, claiming the right to consult with any physicians that the legislature of each State decided to be

legally qualified. Similar action was taken by a majority of the members of the New York Academy of Medicine. This antagonism affected the whole profession in this country, and the immediate result was the formation of New York County and State associations, whose delegates were received by the American Medical Association, to the exclusion of those from the old societies. In 1903 steps were taken to heal their differences and unite the rivals into one body, with the code so modified in effect as to allow individual liberty in the matter of consultation. Consult Flint, 'Medical Ethics and Etiquette' (New York 1883) and 'Principles of Medical Ethics' (Chicago 1912), the official work of the American Medical Association.

MEDICAL EDUCATION, Colleges and Schools, Legal Supervision, etc. Before the establishment of medical schools in this country medical students either went abroad to study or served an apprenticeship with some practising physician. As a rule the apprentice had little opportunity for study, but was forced to depend on what he could absorb by contact with his preceptor. The physicians of the 17th and 18th centuries who had studied abroad were usually classical students. The first public lectures on anatomy before a class of students in this country are said to have been delivered by Dr. William Hunter of Newport, R. I., in 1752. It seems, however, that Dr. Giles Firmin as early as 1647 delivered readings on human osteology in New England; that Dr. Thomas Cadwallader of Philadelphia gave instruction to students in anatomy between 1745 and 1751; and that Drs. John Bard and Peter Middleton dissected the human body in New York City in 1750 for purposes of medical instruction. In 1762 Dr. William Shippen of Philadelphia gave a course of lectures on anatomy, illustrated by actual dissections. These lectures were continued till the organization of the Medical College of Philadelphia (now the medical department of the University of Pennsylvania) in 1765. Dissections were rarely performed prior to 1760 and even autopsies were seldom permitted. At the time of the American Revolution, with a population of 3,000,000, there were probably about 3,500 physicians in the colonies, of whom it is estimated that not more than 400 had received medical degrees. In New England the clergyman was often the only available physician. Two medical schools were organized in the colonies, the Medical College of Philadelphia (now a department of the University of Pennsylvania) in 1765, and the medical department of King's (now Columbia) College, in 1768. The first medical degree conferred in this country, that of bachelor of medicine, was granted to 10 men by the Medical College of Philadelphia in 1768. The degree of doctor of medicine was first conferred in 1770 by the medical school of King's College on two students who had taken the bachelor's degree in 1769. Fifty-one medical degrees had been conferred by these institutions before 1776, when operations were suspended by the war. In the colonial period two medical societies (the State Medical Society of New Jersey, in 1766, and the Delaware State Medical Society, in 1776) and one permanent general hospital were organized. Harvard University Medical School was organized in 1782, Dartmouth Medical College in 1797, the School of Medicine of the University of Maryland and the College of Physicians and Surgeons of New York in 1807. In 1813 the medical department of Columbia College was finally discontinued; the College of Physicians and Surgeons took its place in 1860. Of the 76 medical schools now existing in the United States (less than half the number of schools in operation in 1906), three were established between 1765 and 1800, 12 between 1801 and 1825, 19 between 1826 and 1850, 29 between 1851 and 1875, 80 between 1876 and 1900, 5 between 1901 and 1904.

At the time of the organization of the early medical schools the practice of obstetrics was relegated as a rule to ignorant midwives; physiology, histology, organic chemistry, pathology, and surgery, as now recognized, were hardly known. The schools at first conferred the degree of bachelor of medicine on those who had studied two years with a preceptor and attended one course of lectures, the degree of doctor of medicine after three years of study and two courses of lectures. The bachelor's degree was abandoned in 1813. At first the Medical College of Philadelphia required for admission some knowledge of Greek and Latin, physics, natural history and botany, but the requirement was abandoned about the time of the reorganization of the University of Pennsylvania in 1792. For a century there were as a rule practically no requirements in preliminary general education for admission to medical schools, and even to-day this is their greatest defect.

In 1839 the New York State Medical Society resolved that teaching and licensing ought to be separated as far as possible. Further discussion of this question led to a convention of delegates from all medical schools and societies in the United States, held in New York in 1846; from it sprang the American Medical Association. This national organization, thoroughly representative in character, gave a new impetus to medical societies. The following societies have exercised an important influence in promoting higher standards: Association of American Medical Colleges (1890); American Institute of Homœopathy (1844); National Confederation of Eclectic Medical Colleges (1871); Southern Medical College Association (1892). These prescribe for admission to medical schools a preliminary general education equivalent to one year in a high school. All prescribe four courses of lectures in different years as a condition for an M.D. degree, though they give an allowance of one year to graduates of reputable literary colleges and of other professional schools. All tend to improve facilities for teaching, dissections and clinics. The schools registered by these societies are 72, 19, 7 and 13 respectively.

In 1859 the Chicago Medical College, now the medical department of Northwestern University, was established to test the practicability of a thorough graded system of instruction. Students were divided into three classes, and each class was examined at the close of the

year. Each of the three courses was six months in duration. Attendance on hospital clinical instruction and practical work in the chemical, anatomic and microscopic, or histologic laboratories were required for graduation. In 1871 the Harvard Medical School adopted a similar plan. The Syracuse Medical School followed, and to-day the graded system of consecutive lectures is the rule. In 1896 President Eliot wrote substantially as follows: Within 25 years the whole method of teaching medicine has been revolutionized throughout the United States. The old medical teaching was largely exposition; it gave information at long range about things and processes which were not within reach or sight at the moment. The main means of instruction were lectures, surgical exhibitions in large rooms, appropriately called theatres, rude dissecting rooms with scanty supervision, and clinical visits in large groups. The lectures were repeated year after year with little change, and no graded course was laid down. There was little opportunity for laboratory work. The new medical education aims at imparting manual and ocular skill, and cultivating the mental powers of close attention through prolonged investigations at close quarters with the facts and of just reasoning on the evidence. The subjects of instruction are arranged, as at the Harvard Medical School, in a carefully graded course, which carries the student forward in an orderly and logical way from year to year. Laboratory work in anatomy, medical chemistry, physiology, histology, embryology, pathology and bacteriology demands a large part of the student's attention. In clinical teaching, also, the change is great. Formerly a large group of students accompanied a visiting physician on his rounds, and saw what they could under very disadvantageous conditions. Now instruction has become, in many clinical departments, absolutely individual, the instructor dealing with one student at a time, and personally showing him how to see, hear and touch for himself in all sorts of difficult observation and manipulation. Much instruction is given to small groups of students, three or four at a time — no more than can actually see and touch for themselves.

In 1918 there were, excluding graduate schools, 95 medical schools in the United States with 13,630 students. The growth in medical students in 32 years up to 1910 was 333 per cent. In the last 30 years, however, there has been a radical change in medical education in the United States which has had the effect, as will be shown in the following table, of improving the quality of the education, while at the same time reducing the number of those granted medical degrees. Acting upon the recommendation of the American Medical Association, a committee has made a division of medical schools into three classes, A, B and C, the first containing those medical schools which fulfilled the highest requirements. Here are the results following the reconstruction:

Year	Colleges	Students	Women	Graduates	Women
1904.....	160	28,142	1,129	5,747	.....
1914.....	102	16,502	631	3,594	.....
1915.....	96	14,891	592	3,536	.....
1916.....	95	14,022	566	3,578	134
1918.....	95	13,630	581	2,807	106
1926.....	79	18,840	935	3,962	212
1930.....	76	21,597	955	4,565	204

While the actual number of physicians graduated is very much less than that of the year 1904 the reports of 1930 showed the largest enrolment since 1911. The diminution in number of medical students was not affected by the European War nor was the actual number of medical students and teachers affected by the selective draft, for the Medical Officers' Reserve Corps and the Enlisted Medical Reserve Corps provided against that contingency.

Class A colleges require a four-year high school course and two years of work in a college of arts and sciences approved by the council on education of the American Medical Association. The council also specifies what is required in the studies both in high school and college, and also what is to be expected of the medical schools themselves, both in supervision, equipment, teachers, clinical facilities [including, for instance, daily dispensary cases, at least six maternity cases for each senior student and 30 necropsies for each senior class of 100 students or less], medical library, museum, dissect material, etc. In 1918 there were 69 medical colleges of Class A in the United States and two in Canada.

Medical schools of Class B are those which under the present organization give promise of being made acceptable by general improvements. Of these there are 14 in the United States and six in Canada. Class C contains those which require complete reorganization, do not keep satisfactory records, or enforce entrance requirements or give a major portion of their instruction after 4 P.M., or are privately owned and conducted for profit. Of these there are 12 in the United States.

The comparative value of the work done now and 25 years ago is realized when it is known that in 1904 only 2.5 per cent of medical schools required college work as an entrance requirement, while in 1918 92.2 per cent did, and that in 1904 only 6.2 per cent of the medical students of the country were in the high grade medical schools, while in 1918 there were 95.3 per cent in the better schools, and that in 1904 but 6.4 per cent of the graduates in medicine came from the high grade colleges, while in 1918 the latter graduated 90.3 per cent.

In 1915 a national board of medical examiners was inaugurated with funds from the Carnegie Foundation. The board consists of six representatives from the government [two from the army, two from the navy and two from the public health service], three members of State licensing boards and seven other physicians appointed at large. The three medical schools which make a lower tuition charge for women than for men are the universities of Michigan, Pennsylvania and Vermont.

About 1903 a rapid improvement in medical education began in the United States, resulting in a very great decrease in the number of medical colleges and it was thought that a dearth of physicians would follow. Fears were also expressed that the medical education, the cost of which was thus greatly increased, would be the privilege of the rich, and that it would undemocratically exclude the poor boy, a fear which has not been justified. Apprehensions were also felt that the raising of the standard of medical education would have the effect of decreasing the supply of physicians for

rural communities. This, however, has been obviated by the improvement of facilities in communication — automobiles, better roads, etc.

Out of 76 medical schools about 70 are coeducational, although a few of the medical colleges admitting women have no women students. The State of New York has 9 medical colleges, the largest number in any State.

More attention should be paid in the United States to instruction in hygiene and state medicine. In Great Britain no one can be appointed a medical officer unless he has a special diploma in public health. In this country little opportunity is afforded for general or special sanitary work on broad lines. This subject is now under discussion and doubtless progressive States will soon provide places where medical officers of health or other persons engaged in sanitary work can obtain practical and scientific training. The scientific investigations which would be made in the laboratories of such schools would be of great value to the public.

The earliest law relating exclusively to physicians was passed by Virginia in 1639, but like the later act of 1736 it was designed mainly to regulate their fees. The act of 1736 made concessions to physicians who held university degrees. In only two of the 13 colonies were well-considered laws enacted to define the qualifications of physicians. The general assembly of New York in 1760 decreed that no person should practise as physician or surgeon in the city of New York till examined in physic and surgery and admitted by one of his majesty's council, the judges of the supreme court, the king's attorney-general and the mayor of the city of New York. Such candidates as were approved received certificates conferring the right to practise throughout the whole province, and a penalty of £5 was prescribed for all violations of this law. A similar act was passed by the general assembly of New Jersey in 1772. In 1840 laws had been enacted by the legislatures of nearly all the States to protect citizens from the impositions of quacks. Between 1840 and 1850, however, most of these laws were either repealed or not enforced as a result of the cry that restrictions against unlicensed practitioners were designed only to create a monopoly.

State Supervision.— Careful attention needs to be given to the difference between a license and a degree; the one carrying with it the right to assume a title which is evidence of scholastic ability, the other the right to enter on the practice of a profession or a pursuit, both emanating from the same authority, the State, either directly or through intervening mediums. As foreigners are often puzzled to account for the diversity in our legislation, the fact is again emphasized that all matters of internal police control are left exclusively to the several States, and that national laws regulating professional practice cannot be enacted. Hence the laws of the United States will be silent concerning licenses and degrees except in so far as they may apply to the District of Columbia and certain recent political dependencies.

Licensing.— The requirements for admission to practise a profession in the 54 political divisions of the United States vary as greatly in the various professions as the political divisions differ in area, extent, population and importance. However, two general items appear in full or in part in the various statutory requirements for licensing; namely, (1) the general preliminary education requirements; (2) the professional preparation. The general preliminary are given uniformly under the synopsis of requirements.

Supervision.— In medicine all political divisions except Alaska now have examining and licensing boards. In some States the stringent laws against non-medical practitioners are enforced; in others quackery receives such legal protection that any person may treat "the sick or suffering by mental or spiritual means without the use of any drug or material remedy." This is due largely to the fact that so many statutes lack specific definitions as to what constitutes the practice of medicine, and without these definitions the conviction of such practitioners cannot be secured through the courts. There is much misunderstanding in this country regarding the duty of the State in relation to the health of the people. It does not consist in discriminating between schools or systems of medicine, but in requiring without prejudice or partiality of all who seek a license to practise for gain on the lives of fellow beings a minimum preliminary and professional training.

Medical Sects.—As commonly understood, regular physicians have no distinctive theory or practice; homœopaths treat diseases with drugs that excite in healthy persons symptoms similar to the morbid condition treated; eclectics make use of what they regard as specific remedies, chiefly botanic; physiomedicalists use only botanical remedies, discarding those which are poisonous. In practice these distinctions are not always observed. The following political divisions specify homœopaths, eclectics or osteopaths as constituting part of their examining boards or have other than regulars on them. Arizona, Arkansas, California, Colorado, Georgia, Hawaii, Idaho, Illinois, Indian Territory, Indiana, Iowa, Kansas, Kentucky, Michigan, Minnesota, Missouri, Nebraska, Nevada, New Jersey, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, Wisconsin, Wyoming.

Midwifery.—Special fees for certificates of registration as midwives are required in California, Illinois, Iowa and Texas. In the following political divisions the provisions of the medical practice acts do not apply to women engaged in the practice of midwifery: Arkansas, Colorado, Florida, Georgia, Idaho, Kentucky, Louisiana, Maryland, Mississippi, Montana, New Mexico, North Carolina, South Carolina, Tennessee, Washington. In other political divisions, though there are some special provisions for certain localities, the general acts regulating the practice of medicine make no reference whatever to the practice of midwifery by women. It would seem, therefore, that these laws restrict the practice of midwifery to licensed physicians. Practically the conditions in political divisions where the laws seem to restrict the practice of midwifery to licensed physicians are little better than in political divisions where the practice of midwifery by women without a license is authorized. There will probably be little change for the better till the practice of midwifery is regulated by definite statutory provisions.

MEDICAL EDUCATION IN THE UNITED STATES AND CANADA. Prior to 1765 students from America necessarily went abroad for their medical education, mainly to the medical schools of Edinburgh, London and Paris. Others secured their training by serving an apprenticeship with a practicing physician. The latter custom was common in view of the expense incident to work abroad. As a rule, the apprentice had little opportunity for study, but was forced to depend on what he could absorb by contact with his preceptor. The physicians of the 17th and 18th centuries who had studied abroad were usually classical students. Among the American Edinburgh graduates was John Morgan who had received his bachelor's degree from the College of Philadelphia in 1757. He had studied medicine under such men as William Hunter, Cullen and the Monros, and later visited Europe in search of additional training. While in Edinburgh he conceived the notion of founding a medical school in Philadelphia, the same to be an integral part of the College of Philadelphia. In this project he enlisted the wholehearted co-operation of William Shippen, Jr., a graduate of the College of New Jersey (Princeton). Shippen had studied in London and graduated from Edinburgh in 1762. This idea took concrete form in 1765 when Morgan, Shippen, and later, Rush gathered around them in the city of Philadelphia a group of students for instruction in the essentials of medicine, surgery and midwifery. This was the first medical school in this country—The Medical College of Philadelphia—now a department of the University of Pennsylvania.

During the next half a century other schools followed, some of which were inspired by Louis and Laennec and showed clearly the influence of French medicine.

The first medical degree conferred in this country, that of Bachelor of Medicine, was granted to 10 men by the Medical College of Philadelphia in 1768.

At the time of the American Revolution, with a population of 3,000,000, there were probably about 3,500 physicians in the colonies, of whom it is estimated that not more than 400 had received medical degrees. Although the medical apprenticeship did not entirely disappear, the lecture became more and more widely accepted as the routine method of instruction, and partly in consequence of this tendency an extraordinary number of medical schools were established during the latter half of the 19th century. Some were short-lived, but others soon appeared to replace them. Unhappily, in these efforts to broaden and systematize the content of the medical curriculum, the importance of clinical experience was gradually lost from view, in a short time resulting in the anomaly of students attempting to learn medicine from books, having little or no contact with patients. Sir William Osler is credited with transplanting in this country the British custom of using medical students as clinical clerks in hospital wards, thus introducing a new appreciation of the importance of practical experience in clinical teaching which has influenced in greater or less degree all of our medical schools.

Near the end of the 19th century Germany was the Mecca for those who wished to devote themselves to the newly established and rapidly growing sciences of physiology, pathology and bacteriology. Pupils of Ludwig, Cohnheim and Koch brought back with them not only new knowledge which had to be incorporated in the curriculum, but also a clearer understanding of the need for a satisfactory foundation of general education on which to build. The Association of American Medical Colleges, organized in 1890, recommended a minimum standard of high school graduation as a prerequisite for medicine. Johns Hopkins University in 1893 made a bachelor's degree a prerequisite for admission to the medical school. This action served to call attention to the necessity for at least some required standard of preliminary education.

State control of medical practice during the first half of the 19th century came to be exercised through local medical societies, membership in which was accepted as a sufficient qualification. Later, the diploma of a medical school was accorded the same recognition. The failure of the schools to keep abreast of scientific progress led to the establishment, during the last years of the 19th and the early part of the 20th centuries, of State medical boards with power to examine all candidates and to license those who were successful in meeting the standards of the board. Representing as they do a great improvement over the previous indiscriminating acceptance of school credentials, the State boards have, nevertheless, been handicapped by lack of funds and by political control.

The American Medical Association, organized in 1847, included in its constitution a declaration of purpose, in these words: «cultivating and advancing medical knowledge; elevating the standard of medical education; promoting the usefulness, honor, and interests of the medical profession; enlightening and directing public opinion in regard to the duties, responsibilities and requirements of medical men; for exciting and encouraging emulation and concert of action in the profession and facilitating and fostering friendly intercourse between those engaged in it.» The most significant event in the life of the association was the reorganization in 1901 which brought all local and State societies into an organic union as constituent parts of the American Medical Association. There followed at once an inquiry into the standards and methods of medical schools. Data were collected from State boards showing the relative success or failure of the graduates of the various schools. The need for more comprehensive investigation of the problems of medical education led in 1904 to the establishment by the American Medical Association of a Council on Medical Education. Personal inspections, beginning in 1907, by representatives of the council called attention to the prevailing lack of standards, the meager resources and untrained personnel in many of the proprietary schools. The Carnegie Foundation for the Advancement of Teaching, by invitation of the American Medical Association and accompanied by the Secretary of the Council on Medical Education, visited all schools in the United States and Canada, and the results of their investigation, published in 1910, aroused the public to a recognition of the fact that medical education in this country lagged far behind that in Europe. By repeated visitation and by annual publication of a classified list of schools, the council was able to bring about a most remarkable improvement in the standards of medical education. Many of the weaker

schools closed; others gained strength through consolidation or university affiliation; nearly all were able to secure either private endowment or State support. By 1914 certain principles regarding medical education had become generally established although not by any means fully translated into appropriate action in every institution. These principles were, first, that a definite minimum standard of preliminary education must precede admission to the medical school; second, that in the medical sciences, such as anatomy and physiology, there must be experienced teachers, trained in their respective subjects, rather than practicing physicians who could devote only a few hours a week to the discharge of their academic responsibilities; third, that medicine must be learned neither from books alone nor from lectures only, but chiefly, from the observation of the sick; that hospitals and dispensaries, therefore, were just as necessary to a medical school as a chemical laboratory or a dissecting room; and fourth, to secure public confidence and support and to maintain high academic standards, it was regarded as necessary that medical schools should be integrated with the rest of the system of higher education; that they should become parts of, or at least affiliated with, universities, and that the proprietary interest of the faculty should cease.

State boards were led to adopt rules or secure legislation excluding from the licensing examination graduates of low grade schools. This, in turn, caused the closing or merger of most of those schools which could not reach an acceptable standard, and the surviving schools were enabled to develop better educational programs.

In the development here outlined America borrowed from Europe many of the best features of the Scottish, French, English and German schools, at the same time integrating them with our own system of education and fitting them into our own university structure.

In 1918 there were, excluding graduate schools, 95 medical schools in the United States with 13,630 students. In 1905 there were 160 schools and 26,147 students. The radical change in medical education which has taken place since 1910 has had the effect, as will be shown in the accompanying table, of improving the quality of the education, while at the same time reducing the number of those granted medical degrees. Medical schools were divided into three classes, A, B and C, the first containing those medical schools which fulfilled the highest requirements based on «Essentials» formulated by the Council on Medical Education and Hospitals of the American Medical Association and ratified by the association's House of Delegates. In 1929, medical schools had either attained an A rating or were deemed unworthy of any recognition and thereafter medical schools were listed as approved or unapproved.

The number of medical schools, students and graduates for five-year periods beginning with 1905 is as follows:

Year	Schools	Students	Graduates
1905	160	26,147	5,606
1910	131	21,526	4,440
1915	96	14,891	3,536
1920	85	13,798	3,047
1925	80	18,200	3,974
1930	76	21,597	4,565
1935	77	22,888	5,101
1939	77	21,302	5,089

While the actual number of physicians graduated was very much less than the number graduated in the year 1905, the reports for 1935 showed the largest enrolment since 1905. The classes entering during the World War period were the lowest on record.

During the World War period there was little opportunity for advance in medical education, but in the decade and a half which followed, some schools were able to make remarkable progress toward the attainment of their objectives. Magnificent buildings, extensive equipment, generous support for research, good facilities, liberal budgets based on large endowments, placed not a few of our institutions in a position second to none. This development, apart from its purely financial aspect, has concerned itself largely with clinical teaching and the necessary clinical facilities.

There has also been a steady increase in the amount of preliminary education possessed by students entering upon the study of medicine. Although many schools have additional requirements, the following indicates the preliminary education acceptable to the council:

The minimum requirement for admission to approved medical schools is two years of college training which include English, theoretical and practical courses in physics, biology and general and organic chemistry. Three years or more in college is, however, recommended.

Since it cannot be assumed that all who have satisfied these requirements merely in terms of hourly credits are fitted for the study of medicine, it is desirable that qualitative standards for admission should be imposed.

As a rule candidates should have received their preliminary education in institutions approved by accrediting agencies acceptable to the council. Exceptions to this rule may be made in the case of applicants who have demonstrated superior ability. For the convenience of admitting officers, the council has prepared a list of colleges approved by national and regional educational associations.

Admission to approved medical schools may also be by examination under the following conditions:

(a) Candidates who have completed two years of collegiate instruction and present evidence of general scholarship of high order, but who lack credits in not more than two of the required subjects may be admitted on passing examinations in these subjects.

(b) Candidates who have completed three years of collegiate instruction and present evidence of having accomplished work of distinction in one or more fields of learning, but who lack credit in any or all of the required subjects, may be admitted on passing examinations in these subjects.

While the minimum requirement of the council for approved schools is two years, for the session 1939–40, 66 of the 77 medical schools in the United States, including 10 schools of the basic medical sciences, had a premedical prerequisite in excess of the minimum. Actually only 223, or 3.8 per cent, of the freshman class of 1938–39 were admitted with less than three years. For this session, 21 schools had a requirement of two years. Similar figures computed on the basis of the freshman class of 1936–37 placed 12 per cent in this class, or 716 students.

The requirements for admission to practice a profession in the United States vary as greatly

in the various professions as the political divisions differ in area, extent, population and importance. However, two general items appear in full or in part in the various statutory requirements for licensing; namely, (1) the general preliminary education requirements; (2) the professional preparation. Reciprocity or endorsement policies exist between the States. Further, in 1915 a National Board of Medical Examiners was organized, and at present its certificate is acceptable for medical licensure without examination in 42 States.

The medical course in the United States in general covers four academic years of approximately 32 weeks each. Fifty-one schools offer such a course. The medical schools of Northwestern and Duke Universities and those of the Universities of Minnesota and Tennessee operate on the quarter system, permitting a student by utilizing the summer months to decrease the length of time necessary to obtain his degree. A considerable number of the students of these schools do not elect to study during the summer months. The medical schools of the University of Chicago are operated on a plan of individual promotion permitting a student to advance as rapidly as he desires, but the great majority complete the course in 12 quarters. Fifty-five schools require a four-year course, while 12 require four years of systematic instruction followed by a fifth year spent as an intern or in research work. Ten schools offer only a two-year course. For the most part the latter are located in smaller communities where clinical material is so scarce that satisfactory teaching of clinical medicine would be utterly impossible. In many instances, facilities do not exist for the satisfactory teaching of such subjects as physical diagnosis and gross pathology, which involve the use of clinical material. The same is true of the introductory courses in medicine and surgery, which commonly form a part of the second year schedule. These schools since 1 July 1939 have been listed as recognized schools of the basic medical sciences.

The standard curriculum recognized by the Council on Medical Education and Hospitals consists of from 3,600 to 4,400 hours, distributed as from 900 to 1,100 hours a year, and grouped as set forth in the following schedule, each group to be allotted approximately the percentage of hours of the whole number of hours in the courses as stated:

		Per Cent	
1. Anatomy, including embryology and histology	14	....	18.5
2. Physiology	4.5	....	6
3. Biochemistry	3.5	....	4.5
4. Pathology, bacteriology and immunology	10	....	13
5. Pharmacology	4	....	5
6. Hygiene and sanitation	3	....	4
7. General medicine	20	....	26.5
Neurology and psychiatry			
Pediatrics			
Dermatology and syphilology			
8. General surgery	13	....	17.5
Orthopedic surgery			
Urology			
Ophthalmology			
Otolaryngology			
Roentgenology			
9. Obstetrics and gynecology	4	....	5
Totals	76	....	100
Electives	24	....	0

When the teaching conditions demand it, a subject may be transferred from one division to another.

In the published lists of the Council on Medical Education and Hospitals, 67 medical schools in the United States and nine in Canada are listed, and 10 schools of the basic medical sciences in the United States and one in Canada, are also listed. All but three of these schools at the present time enjoy the approval of the council, the three being on probation. In 85 schools, 6,364 freshmen students, 5,733 sophomores, 5,506 juniors, 5,447 seniors, 398 fifth year and 247 sixth year students were enrolled during the session 1938–39. In the two medical schools of the University of Chicago, 520 students were enrolled, making a total of 24,215 in the 87 schools. There were, therefore, in the medical schools of the United States, 5,754 freshmen, 5,160 sophomores, 4,947 juniors, 4,921 seniors, plus the 520 students of the University of Chicago, making a total of 21,302. The enrolment in the schools of the basic medical sciences in the United States for the session 1938–39 numbered 569, of which 330 were freshmen and 239 sophomores. The enrolment in the 10 Canadian schools was, first year, 610; second year, 573; third year, 559, fourth year, 526; fifth year, 398, and sixth year, 247, a total of 2,913. In the one school of the basic medical sciences in Canada there were 47 students—24 freshmen and 23 sophomores.

The 24,215 medical students enrolled exclude 1,152 fifth year students in the United States interning or engaged in research, and 121 in Canada interning as a requirement for the degree of Doctor of Medicine.

There are 10 medical schools in Canada which offer a complete medical course and one which offers courses in the medical sciences covering two years only. All of these schools enjoy the approval of the Council on Medical Education and Hospitals. These schools vary in their preliminary requirement. For the session 1939–40 one required a degree for admission to a five-year course. Of the nine other schools, four have a six-year medical course preceded by senior matriculation which is equivalent to the work of the first year in a college of arts; one requires one year for entrance to a five-year medical course; three, including one school offering courses in the basic medical sciences, require two years and one has a three-year prerequisite.

It cannot be too strongly urged that those who wish to enter the medical profession should secure their training in an institution which is recognized by all State licensing boards. Otherwise they may find that their time and money have been wasted. There are schools in existence which do not measure up to accepted standards and therefore cannot be approved by licensing bodies. Students should most carefully consider the difficulties of future practice before entering one of these institutions.

It is not possible to estimate accurately the cost of a medical education. Living costs vary in different parts of the country, and personal expenditures vary still more. There is also a difference in the charges made by medical schools for tuition. For the session 1938–39, three schools charged fees of less than $100 a year. These were State universities which make an additional charge for nonresidents. State universities, generally speaking, do not accept students from outside the State. In 15 colleges fees were over $500. Thirty schools made an additional charge for nonresidents ranging from $37.50 to $400. These amounts include annual

tuition fees and minor charges, such as for matriculation, breakage and graduation. Though the fees in some instances seem large they do not by any means cover the cost of instruction. No medical school at the present time can maintain extensive laboratories, pay the essential salaries to teachers and properly teach modern medicine without an income larger than that derived from students' fees. Medical schools, along with other institutions of the higher learning, have been affected by the economic situation. Almost without exception income has been reduced, and in order to balance the budget, fees have been increased.

It is extremely difficult for a student to earn money while at the same time he is carrying on his medical studies. The medical curriculum is so exacting that all available time should be spent in study. Many a student, in an effort to be self-supporting, has ruined his health or his scholarship. Once a student has been dropped, it is extraordinarily difficult to obtain admission elsewhere. The reason for this is that every school has many more applicants than it can receive, and in face of such active competition a student who has once tried and failed can scarcely hope to be given another chance to the exclusion of some other applicant whose record is unblemished. Therefore, unless a student has some very unusual ability which enables him to earn enough to support himself in a couple of hours a day, he should not expect to earn his way through medical school. It would be better for him to work until he accumulates the required reserves and then go to school. The physician has heavy responsibilities, and to discharge these obligations conscientiously he needs the best training that is obtainable. To warrant his sacrifice of time and money he must be sure to get during his college years an adequate foundation for his professional career.

Provision is made in some schools for scholarships and loan funds for deserving students. In some instances the award is made solely on scholarship, but ordinarily the needs of the student are also given due consideration. The scholarship may consist of the remission of the annual tuition fee or there may be a definite money payment to the recipient. In some instances scholarships are limited to residents of the State.

Women are admitted to all medical schools of the United States and Canada except the following schools: Emory, Harvard, St. Louis, Dartmouth, Hahnemann, Jefferson, and Queen's University in Canada.

In the United States the licensing of physicians is a function of the States. Each State has its own board of medical examiners or department of registration. The medical practice acts of the various States differ, and information regarding the regulations for practice should be obtained directly from the officers within a State.

In September 1933 the Council on Medical Education and Hospitals voted to undertake a resurvey of all medical schools in the United States and Canada. During the academic years 1934–35 and 1935–36, Dr. Herman G. Weiskotten, dean of Syracuse University College of Medicine, visited all schools in company with a representative of the council, the Association of American Medical Colleges or the Federation of State Medical Boards of the United States. A confidential report in graphic form by which the schools were grouped in tenths of a rank order of excellence for each one of several criteria was sent to the schools visited. A committee of the council late in 1939 finished its final report which presents a comprehensive review of medical education in this country from 1934 to 1939. Schools of osteopathy and a few unapproved medical schools refused to permit an inspection or to furnish official reports. When the survey of medical schools was undertaken in the fall of 1934, the number of medical students admitted to the first year classes in 76 schools in the United States was 6,537. The corresponding figure for 1939 was 5,768, a decrease of 769. On the other hand, the size of upper classes has not been reduced to the same extent. More careful selection of the students accepted will doubtless tend to diminish the number who drop out because of scholastic failure, so that the number of graduates may show a smaller decline than the number of matriculants. During the four years, 1935 to 1938 inclusive, the number of persons licensed annually to practice medicine increased from 5,509 to 6,252, showing that the reduction in the number of medical students had not diminished the number of physicians added each year to the medical profession. The excess of physicians licensed annually over the number of medical graduates is attributable to the licensing of graduates of schools outside of the United States. At the time the schools were visited, the number of teachers with professorial rank in the basic medical science departments of the 66 four-year schools was 1,084; the number of students in the first two years was 11,434. The teacher-student ratio, therefore, for men in the higher ranks was 1:11. For 1939, the corresponding figure was 1,247 professors and 10,551 students, with a teacher-student ratio of 1:8.

Since the completion of the survey, in a group of 28 of the less progressive schools, preclinical facilities have been improved in 17 at a cost of from $29,000 to $500,000 with an average of $89,941. The total amount contributed for this purpose was in excess of $1,500,000. Facilities for clinical teaching in 20 have been improved at costs ranging from $10,000 to $2,500,000. Total expenditure for this purpose has been in excess of $10,500,000 with an average of $545,795. Twenty-four of these 28 schools have increased their annual budgets by amounts varying from $10,347 to $87,816, with an average of more than $47,000 and an aggregate of over $1,100,000. Such increasing expenditures during the depression years surely indicates a determination on the part of the public and the profession that there shall be no falling off in the standards of medical education or the quality of medical service. The policy of the council during this survey was different from what it was in 1905–10 for the reason that the whole picture of medical education is radically different from what it was at that time. Even the weakest of the medical schools at the time of this survey was a stable institution as compared with the numerous proprietary schools and diploma mills in existence at the time that the council was created.

In 1937 the medical schools of Canada were approached regarding the survey of Canadian medical schools made during 1934–36 as to the policy to be adopted in the future—that is, whether the American Medical Association should continue the grading of medical schools in Canada or whether they would prefer that

the medical schools themselves or some other body take over this task. The problem was referred to the Canadian Medical Association which in June 1938 brought in a report to the effect that in the event of the Council on Medical Education and Hospitals of the American Medical Association publishing a list of approved schools, those Canadian schools wishing their inspection and approval could request this inspection. This leaves each school free to deal directly with the council. In May 1939, the council voted that after 1 Jan. 1945 the Canadian medical schools would be included in the council's classification only at their own request.

American medicine is assuming more and more a position of leadership and distinction in the world. A decline in the quality of medical education in many European countries has increased the responsibility of our medical schools to keep medical education abreast of the rapid advances in the knowledge applicable to medicine. It is important to realize that the survey above discussed is part of a continuous process. The relationships of the Council on Medical Education and Hospitals to the medical schools and hospitals are on a day to day basis. The accrediting activities of the council, which were the first in professional education and which have been supported from the beginning by the medical profession, make it possible to keep not only the personnel of the medical schools and hospitals but also the general medical profession in touch with developments in medical education. The physician realizes, as no one else can, the disasters, personal or communal, that flow from ignorance and improper or incomplete preparation, and these can be prevented only by insistence upon high standards of medical education. There are now sufficient medical schools for the instruction of physicians to meet the needs, so far as can be ascertained, of the public. It is true that a number of students every year fail to obtain admission to existing institutions, but these are for the most part border-line students and those least likely to render useful service in the practice of medicine. Widespread publicity and generally diffused knowledge of the council's activities have had a most salutary influence on the selection by men and women of medical schools qualified to prepare them for the ever increasing complexity of the actual requirements for the care of the sick and the prevention of disease.

WILLIAM D. CUTTER, M.D.,
Secretary, Council on Medical Education and Hospitals, American Medical Association.

MEDICAL FIELD SERVICE. See AMBULANCE COMPANIES; HOSPITALS, MILITARY; MEDICAL ORGANIZATION IN THE UNITED STATES ARMY.

MEDICAL JOURNALISM. One of the earliest newspapers on record, the *Gazette de France,* was issued by a physician, Renaudot (Paris 1631). He established the *Gazette* to bring employers and employees together. It was a quarto sheet, printed in four columns on one side. Medical matters were not treated directly in the *Gazette,* but its purpose was the prevention of disease and suffering by lessening poverty. With the origin of scientific societies in Italy at the time of the Renaissance, these published journals which sometimes contained articles of medical interest. The first journal paying considerable attention to medicine was *Le Journal des Scavans.* This was published every Monday for three months at Paris, at the beginning of 1665, the next year it continued longer, and then every two weeks rather regularly. It lasted some 10 years, and altogether some 700 pages were printed. Early issues, contained reviews of Willis' 'Cerebri Anatome,' and Steno's 'De Musculis et Glandulis,' and other medical reviews of current interest. The German Society of Naturalist Physicians (Gesellschaft Naturforschender Aerzte), founded in 1652, began to publish in 1670, after coming under Imperial protection, its 'Transactions' monthly under the name *Ephemeridæ.* A more purely medical periodical was the *Acta Medica Hafiensia,* edited by Thomas Bartholin at Copenhagen in 1671. The Royal Society chartered by Charles II began to publish its well-known philosophical 'Transactions' in 1665. Included among its publications were the works of Malpighi and Leeuwenhoek in the 17th century and those of Galvani in the 18th.

All these were in Latin. The first medical periodical in the vernacular was the *Nouvelles Découvertes sur toutes les Parties de la Médecine,* issued monthly (Paris 1679–81). It was published by Nicholas de Blagny, a somewhat irregular medical practitioner of the time who realized the value of publicity. He met with decided opposition from the medical profession, who deprecated not only his methods but above all the publication of medical matters in the language of the people. He waked the French medical profession, however, to the value of a medical publication and not long after, a *Journal de Médecine* was published by the Abbé de la Roque and continued by Claude Brunet, who established a monthly, *Progrès de la Médecine* (1695–1709). French medical journalism then went to sleep, to use the expressive phrase of Südhoff, for some 50 years. Formal German medical journalism began with the *Acta Medicorum Berolinensium,* founded in 1717. This appeared twice a year at first, and then annually until 1730. In 1717, there began at Leipzig a quarterly publication called the *Collection of Natural History and Medical Information.* This continued for many years. The second half of the 18th century saw a thorough waking up to the advantage of medical journalism. At Hamburg in 1759 the weekly, *Der Artz,* began. In various German cities, a series of medical Bibliotheks, that is, regularly issued reviews of medical books, made their appearance. In 1767, the German medical journal, *Neue Arzneien* (New Remedies) was founded. Most of these journals lasted only a few years until their founder became occupied with other things or his enthusiasm evaporated.

Eighteenth century medical journalism or its equivalent, at the time, consisted to a great extent of the transactions of various medical societies. A number of very important contributions to medicine were published originally in these and they have a distinct bibliographic value. Südhoff suggests that the material for the cultural history of medicine in this century lies buried in the files of its forgotten medical periodicals. These were very numerous and Garrison has given a check list in chronological order of some hundred of them.

Toward the end of the 18th century, the special journals of the scientific departments of medicine began to make their appearance. Probably the most important of these was

Reil's *Archiv für die Physiologie* (1795), which was the incentive for the foundation of Johannes Müller's *Archiv für Anatomie, Physiologie und wissenschaftliche médicin* (Berlin and Leipzig, 1834–57), continued by Reichert and Du Bois Reymond and still published at the present time. Siebold's *Lucina* (Leipzig 1802–11), Langenbeck's *Bibliothek für die Chirurgie* (Göttingen 1805–13), Grafe's and Walther's *Journal der Chirurgie und Augen-Heilkunde* (Berlin 1820–50), Magendie's *Journal de physiologie expérimentale* (Paris 1821–31), Malgaigne's *Journal de Chirurgie* (Paris 1843–46), *Bulletin de la Société anatomique de Paris* (founded in 1826 and still current), and the *Mémoires* and *Bulletin de l'Académie de medecine* are typical examples.

About the middle of the 19th century, yearbooks began to be regularly published. About the same time Virchow's *Archiv für Pathologische Anatomie* and the *Comptes rendus* of the *Société de Biologie* of Paris began publication. There are now literally hundreds of such journals published in the various countries and languages. The tendency to extreme specialization in medical journalism became marked in the last quarter of the century when special journals for narrow interests were published. *Mind* (1876), *Brain* (1879), and *La Cellule* (1884), are typical examples. Garrison notes that the contribution of the 20th century to medical journalism is the large number of recent periodicals devoted to the psychological and sociological aspects of the sexual instinct.

In Italy medical journalism developed rather slowly, Italian professors being inclined rather to write books than the shorter articles. Certain special subjects like electrotherapeutics, because of Galvani's and Volta's discoveries, were covered early. *Il Galvani*, with the subtitle *Giornale di Elettro-Idro-ed Aero-Terapia*, was published at Milan at the beginning of the 19th century. All medical therapeutics was reduced to electrical terms by it. Since then the Italians have the habit of calling their medical journals after their great physicians, and have had journals named for Cesalpino, Malpighi, Spallanzani and a number of other distinguished medical discoverers.

A very early attempt at the publication of a medical journal in America was made through a translation of the French *Journal of the Military Hospitals*, under the title of *A Journal of the Practice of Medicine, Surgery and Pharmacy in the Military Hospitals of France* (Vol. I, No. 1, New York 1790). This contained some 120 pages but is the only number that has come down to us.

The first medical journal published in America was the *Medical Repository*, a quarterly, under the editorship of Samuel L. Mitchill, Edward Miller and Elihu Smith. It was founded in 1797, and the interest which it aroused can be best appreciated from the fact that of volumes I and II, a second edition was printed in 1800 and exhausted, and a third edition issued in 1804. This is the only time in the history of American medical journalism that this has happened. The *Medical Repository* continued publication until 1824. Its success led after a few years to the almost simultaneous foundation at Philadelphia of two medical journals, *The Medical Museum* (1804–11) and the *Philadelphia Medical and Physical Journal* (1804–07). Though neither of these lasted long, the establishment of other medical journals went apace. In Boston, the *Medical and Agricultural Register* was published for two years (1806–07), the *Baltimore Medical and Physical Recorder* for a similar period (1808–09). An effort was made to attract additional readers in these journals by including subjects of cognate interest. This was also the case with regard to the *American Medical and Philosophical Register* (New York), which lasted, however, only some five years (1810–14). *The New England Journal of Medicine and Surgery* had a happier fate, enduring some 15 years (Boston 1812–28). Philadelphia had by this time, owing to professional jealousies and politics and the mismanagement of medical schools in New York, come to be the centre of medical education in the United States and the medical journalism of the country focussed there. The *American Medical Recorder* (1813) lasted more than 10 years and was followed by the *Philadelphia Journal of the Medical and Physical Sciences*, founded in 1820 by Nathaniel Chapman. In 1825, the title of this journal became the *American Journal of the Medical Sciences*, still with us. Under the editorship of Dr. Isaac Hays and his son, this came to be the representative American medical journal long known as *Hays' Journal*. The oldest American medical weekly in existence is the *Boston Medical and Surgical Journal*, founded in 1828, whose editors have been some of the most distinguished physicians of Boston. The *Medical News*, founded in Philadelphia by the younger Dr. Hays in 1843, was transferred to New York (1896) and combined with the *New York Medical Journal* (1905). This latter was founded in 1865, followed almost immediately by the *Medical Record* (1866), both still in existence.

The first medical journal issued west of the Alleghanies was the quarterly *Reporter of Medicine, Surgery and Natural Sciences*, issued at Cincinnati, 1822. The first Canadian medical periodical was the *Journal de Médecine de Quebec*, issued in 1826.

The founder of medical journalism in its modern sense, as not only a carrier of news and information for physicians but also as a force for the uplift of the profession, the regulation of the practice of medicine, the direction of medical legislation, and the exposure of abuses, was Thomas Wakley, an Englishman, who in 1823 founded *The Lancet* in London. When this appeared there were a great many abuses, especially in hospital practice and medical education needing correction. Hospital posts and even sometimes medical professorships had become family matters, subjects of inheritance. Hospital instruction was so given that it reached but a very limited number. Wakley began by publishing the hospital lectures of professors for the benefit of the profession. When Abernethy, the distinguished London surgeon of the time, applied for an injunction against the publication of his lectures without his permission, Lord Eldon decided that lectures delivered in hospitals were public property. The trial proved a good advertisement for Wakley and his work, and after a time he was elected to Parliament and he became the most important factor in England for the correction of social abuses by legislation. *The*

Lancet has always continued the work of its founder in this regard, and has been noted for its crusades against food and drug adulterations, its campaigns for the correction of medical abuses, and its leadership of the medical profession of England generally for the amelioration of medical social conditions. The work of *The Lancet* was not only supplemented but extended in England, when the *British Medical Journal,* representing the British Medical Association, was founded in 1857. The association, organized in 1832, published yearly 'Transactions' until 1853, and then the *Association Medical Journal,* which was succeeded by the *British Medical Journal* after some five years. The *British Medical Journal* has come to be a most powerful factor for the correction of medical abuses and the exposition of impositions of various kinds upon the profession as well as the public. The American Medical Association, founded in 1847, did not establish its journal until 1883. This was scarcely more than a weekly 'Transactions' until under the management of Dr. George Simmons, at the beginning of the present century, it began to be thoroughly representative of the best interests of the medical profession in America and of the genuine medical interests of the public, taking its place worthily beside the *British Medical Journal.* The *Journal A. M. A.* initiated the reform of medical education by securing four-year courses and full-time professorships in the medical schools, and thus has secured a noteworthy reduction in the number of schools of medicine in the country, decidedly to the advantage of medical teaching generally. It was enabled to do this through its reorganization of the American Medical Association which strengthened State and county medical organizations and brought a reform of their medical journals. The advertising abuses of medical journals were emphatically pointed out and an initiation of reform secured. The *Journal A. M. A.* has done extremely valuable work for the medical profession and the public in the exposure of quacks, the regulation of physicians' registration and, above all, the analysis and exposure of so-called patent medicines, many of which selling in very large quantities, at expensive prices and bought particularly by the poor, were shown to contain either such harmful materials as alcohol or cocaine as their chief ingredient, or else to be made up of absolutely inert materials like salt or sugar and water, slightly colored.

The success of the London *Lancet* led to the foundation of the *Lancette Française* in 1828, which followed the plan of reporting hospital lectures and afterward became the *Gazette des Hopitaux,* which still continues. The *Gazette Médicale de Paris* was founded in 1830. Other French journals in large numbers were founded in the second half of the 19th century and the weekly newspapers were supplemented by the *Progrès Médicale,* paying attention particularly to current medical items, Paris, 1873. In the last quarter of the 19th century a whole series of such weekly journals meant to carry medical news and represent the medical profession as well as organize the correction of abuses, were founded in various parts of the world. The *Deutsche Medizin, Wochenschrift* in 1875, *Vrach* in Saint Petersburg in 1880, and Geneva, Munich, Prague, Rome, Vienna and many other cities came to be represented in this way.

At the beginning of the European War, there were some 1,700 medical journals published in the various languages. Their distribution was as follows: the United States had 630; Germany, that is, the German-speaking countries, 451; the French, 268; the British, 152; the Italian, 75; the Spanish, 29. This was entirely too many for the maintenance of such proper standards as would make them seriously valuable and prevent abuses. Many of them were published almost entirely as a means of propagating information for business purposes with regard to various drugs and preparations, the journals being established for this purpose, or the proprietors allowing their columns to be used for such exploitation because of the money paid for advertising. The more medical journals the lower the standards. The war, with its scarcity of paper, etc., brought an end to a great many of the proprietory medical journals and undoubtedly it has done very much to purify the field of medical journalism.

Bibliography.—Chereau, 'Journalisme Medicale Français' (L'Union Medicale, 1867); Garrison, 'Medical Journalism' (article in 'Reference Handbook of the Medical Sciences,' New York 1918), and 'History of Medicine' (New York 1918, 2d ed.); Südhoff, 'Das Mediz, Zeitschrift-Wesen im Deutschland' (Münich Med. Wochenschrift, 1903).

JAMES J. WALSH, M.D.

MEDICAL JURISPRUDENCE, the science of applying medical knowledge to the purposes of legal investigation; the application of the principles and practice of various branches of medicine in judicial proceedings requiring the explanation of doubtful questions, such as those relating to conception and birth, time and cause of death, physical and mental diseases, etc. Medical jurisprudence is often spoken of as forensic medicine, that is, the medicine of the forum. It embraces subjects both purely medical and purely legal, and covers a very wide range. These questions have usually been considered under five divisions: (1) Such as arise out of the relation of sex, including impotency, pregnancy, legitimacy and rape; (2) injuries to persons, as wounds, death from violence, poisoning and abortion; (3) disqualification by different forms of mental diseases; (4) feigned disability or disease; (5) questions as to age, identity and life insurance. The major part of what is known as medical jurisprudence relates to evidence given in courts, even if the whole subject is not properly embraced within the subject of judicial evidence. As medical books can be used only in a very restricted sense in judicial proceedings, the testimony of medical experts has become very important. Our laws do not give recognized preference to any particular class or school of medical practitioners as qualified for expert witnesses. Knowledge is the test of qualification to give such evidence. The presiding judge passes, as a preliminary, upon the question of qualification and determines whether the witness shall be permitted to testify. The opinion of a medical expert is never conclusive but is simply to be regarded by the judge or jury in the same manner as other evidence given to assist in establishing a fact. The medical expert is fre-

quently called upon to state facts, as well as to give his opinion based upon facts shown by other testimony to exist. He may testify as to the health of a patient whom he had treated, of his habits and mental traits. He may testify that he found poison in the stomach of a person found dead and give an opinion as to whether the poison caused death. He may give an opinion as to how long a person has been dead, from the condition of the body when found; whether a certain wound would produce death; and his opinion as to the instrument used to inflict the wound.

In all of these subjects of investigation the evidence of a medical expert is almost indispensable. In matters of life insurance, where the insured dies shortly after a policy has been issued to him, medical expert examination and evidence are often of great importance, bearing upon the condition of the insured at the time of insurance and upon the question of representations. In suits for injuries to persons through the fault of others the question of the extent and probable continuance of disability are to be investigated with the aid of expert evidence. Many questions of supposed crime could not be properly determined without the knowledge and skill of the physician, applied as science directs. In cases involving sanity and mental capacity medical jurisprudence reaches the zenith of its importance. The untrained non-scientific mind cannot measure the status and capacity of other minds. If it is difficult, sometimes nearly impossible, for the best informed to determine accurately the physical condition of a person, none but those eminent for knowledge of and experience in matters of the mind ought to judge of its condition and hazard opinions as to its peculiarities and capacity. Insanity is a disease of the mind which assumes many forms —almost as many as there are different phases in the human mind. Many definitions are given of insanity, one of which is that it is a physical disease located in the brain, which deranges the mental and moral faculties to a greater or less degree. This definition is not quoted in preference to any other for the purpose of approval, but because it differs so radically from others, and to show the difficulty of comprehending the nature of this dread malady. The general term insanity comprehends all shades of mental diseases, from the slightest abnormal condition to that of the wildest maniac. The expert alienist is called upon to testify as to a person's ability to make a will, a contract or to transact any kind of business. He is asked to decide whether a person is bereft of his normal reason to the extent that prudence requires his confinement; and when he has been confined, whether it would be safe or prudent to let him have his liberty. The questions upon which the expert's opinion with regard to the insane, or those supposed to be insane, are asked, can hardly be enumerated. The importance of the subject cannot be overestimated, and new and earnest efforts are being constantly exerted by the medical profession to render its information upon this difficult subject as full and complete as possible. Many works upon medical jurisprudence have been published and in all of them insanity, in its various forms, has had a prominent place, while quite a number of authors have produced commendable works devoted entirely to the subject of the medical jurisprudence of insanity. Consult Scheffel, Carl, *Medical Jurisprudence* (Philadelphia 1931); and Smith, S. A., *Forensic Medicine* (8th ed., London 1943).

MEDICAL ORGANIZATION, United States Army. The separation of the War Department into a Department of the Army and a Department of the Air Force by the National Security Act of 1947 required certain changes in medical organization which were not immediately worked out. While the historical part of the present article will deal with the medical organization of the War Department, the statement of present medical organization and functions will deal, except in a few instances, with those of the Department of the Army.

History.—The history of the United States Army Medical Department began in the Colony of Massachusetts Bay on May 8, 1775, when the Provincial Congress ordered that a committee of physicians, appointed by the Congress, examine as to professional qualifications all persons recommended for appointment as surgeons to the several regiments by their commanding officers. Prior to this date, medical aid had been voluntarily rendered by private physicians, who later sent in bills for services rendered. These physicians had no military status or authority. At this time the inchoate medical establishment of the army was termed "The Hospital." On July 19, 1775, the Colonial Congress in Philadelphia appointed a committee to consider ways and means of establishing the hospital, a project strongly recommended by Gen. George Washington. The Colonial Congress, on July 27, 1775, created "An Hospital," with Dr. Benjamin Church (q.v.) as director general and chief physician, at four dollars per diem. Three months later Church was tried by a council of war for treasonable correspondence with the enemy, and imprisoned. Dr. John Morgan (q.v.) was appointed to succeed him. Morgan, who had been instrumental in organizing the medical department of the University of Pennsylvania (1765), rendered most valuable services up to his dismissal from the army, Jan. 9, 1777. On April 11, Dr. William Shippen (q.v.) was appointed to succeed Morgan, who later (1779) received a handsome exoneration at the hands of Congress. Morgan's dismissal was due, in part, to the increasing sickness among the troops and to the difficulty in supplying them with medical supplies, but principally to the fact that the medical service was very loosely organized. As there was no strong central government and no War Department, it necessarily followed that there could not be an organized medical service under central direction. At this time the Prussian and British plan of medical administration was in vogue, with physicians, surgeons, and deputy directors general, and a fourth staff officer dubbed "Physician and Surgeon General of the Army" in each of the Middle, Eastern, and Northern departments. These four "generals" were of vague status and their office was apparently established at the same time as that of the director of "The Hospital." All this led to further contretemps, such as the court-martial and acquittal of Shippen (1780). The congressional resolution of Sept. 30, 1780 resulted in the election of Shippen as director general and the appointment of John Cochran as chief physician and surgeon. By the end of the war, con-

gressional acts assigned a director and deputy director of the Hospital Department. General Washington manifested the keenest interest in the welfare of the medical establishment, as evidenced particularly in his instructions to Morgan for the removal of the hospital to New York (April 3, 1776), his letters to John Hancock on the doubtful and jealous character of the regimental surgeons and their intrigues against the hospital (1776–1777), and his letter of approval of Shippen's and Cochran's plan for reorganization (Feb. 14, 1777). The first hospital regulations, drafted by Morgan after conference with Washington and the regimental surgeons, were published in July 1776. The first army regulations, drafted by Friedrich Wilhelm von Steuben (q.v.) in the winter of 1778–1779, contained a section on "treatment of the sick."

While the results achieved by the medical service during the Revolutionary War seem open to criticism, it must be remembered that the high mortality among the troops enrolled, not dissimilar to that of other armies of that time, was due chiefly to respiratory and gastrointestinal diseases in epidemic forms, and to septic conditions following battle wounds. As might be expected, regimental hospitals were collections of sick men huddled together without organization, regulation, sufficient clothing, or rudimentary comforts. Many fatal infections at that time were caused by the common practice of variolating with human unattenuated smallpox virus through purchase of scabs in the open market. This practice, although forbidden by Gen. Horatio Gates, continued until swept away by Jennerian vaccination in 1796–1798. The earliest examples of the Medical Department's contribution to medicine are found, however, during this period, in the publication of the first American pharmacopeia in 1778 and the publication of a treatise on wounds and fractures in 1776 by Dr. John Jones (q.v.). The latter was not only the first American book on surgery but also, by reason of the appendix on camp and military hospitals, the first American book on military medicine. During the Revolutionary War, 1,400 medical men of the colonies volunteered their services. Many of them achieved eminence, not only in the field of medicine but also in actual command of troops, and in the legislative halls of Congress.

Following Yorktown (Oct. 19, 1781), Congress rapidly demobilized the army in 1782–1783 and the Hospital Department was all but disbanded. In 1792 the army was reorganized as a "legion" (5,120 men), with Richard Allison as surgeon of the legion (1792–1796). In 1798, war being imminent with France, Congress authorized an army of 10,000, with James Craik (q.v.) as physician general (1798–1800). In 1800, when war did not eventuate, these forces were disbanded. The strength of the army at the outbreak of the War of 1812 was 6,742. The Medical Department was reorganized, but without a strong, centralized head. It encountered the same difficulties as were encountered in the revolution. Mortality, morbidity, and noneffectiveness due to communicable diseases constituted a far greater drain upon manpower than battle casualties. Military authorities now agree that the ravages of smallpox and other communicable diseases were the chief causes of the failure of various campaigns in the war.

In 1813, James Tilton was appointed physician and surgeon general. In 1814 regulations of the Medical Department were issued, defining for the first time the duties of a medical officer. Tilton initiated a fundamental policy when he abolished the distinction between a physician and a surgeon. Medical officers of the army since that time have been known as surgeons, but the duties required of them are in nowise limited to surgery as a specialty in the field of medical practice.

After the War of 1812, the army was again disbanded, the physician and surgeon general was discharged, (1815), and there was no Medical Department until 1818 when Joseph Lovell was appointed surgeon general. From the time of his appointment to the present, the history of the department is unbroken; it has always had a surgeon general, always remained a corps organization.

Lovell effected a central organization, required allegiance on the part of post, departmental, and territorial surgeons, revised the regulations for the administration of the Medical Department, and made the first annual report of the department to the secretary of war. He also initiated at all military stations a system of observations and reports of weather by the medical officers stationed there. This constituted the only weather service of the country for many years. During his incumbency (1818–1836) the practice of requiring professional examinations of candidates for the Medical Corps, continued since 1775, was regularized by an act of Congress, and medical officers were given the pay and relative rank of other officers of the army. Serving under Lovell, Assistant Surgeon William Beaumont (q.v.), in 1833, published his work on digestion which won him recognition as the pioneer physiologist of the United States. In 1836, Surgeon General Lovell established the library of the Surgeon General's Office.

Although the Medical Department made few notable scientific contributions to medicine from Beaumont's day to the Civil War, important administrative developments occurred during that period. Among the most important were the granting of definite rank to medical officers in February 1847; an increase in the Medical Department in 1848 to service the many new garrisons in the new territory acquired during the Mexican War; the bestowal upon medical officers of the right of command in their own department, with special reference to patients in hospitals; the appointment of hospital stewards in 1856; the publication of *Medical Statistics, U. S. Army*, the first part in 1857, the second in 1859; the detail of the first delegate of the Medical Department to the American Medical Association in 1851, and the adoption of the use of ambulances in 1859. Otherwise, the Medical Department went along doing its duty in garrison and field, in peace and war. It fought scurvy, malaria, typhoid, dysentery, diarrhea, as well as Indians, Mexicans, and official neglect.

The Civil War found the government and the Medical Department unprepared. There was no organized ambulance or field hospital service, and no organization for evacuation to the rear, where hospital service was hastily improvised in hotels, barns, and neighboring private houses. The introduction of rifled arms, with fixed ammunition and conoidal bullets, had vastly increased the range and rapidity of fire, with much wider danger zones and greater dispersion of the wounded over the field. As the engagements

increased in magnitude, the wounded lay helpless on the battlefield for hours extending to days before the slow work of evacuation was completed. This not only caused immense suffering and losses among the wounded, but also interfered seriously with the mobility of fighting units through delays and stalling of vehicles, sometimes demoralized commands as to fighting capacity, and encouraged skulkers to desert the lines under the pretext of assisting the wounded to the rear. All this was changed by the advent of Jonathan Letterman (1824–1872), who became the medical director of the Army of the Potomac on June 19, 1862, and whose genius for medical administration brought about the epoch-making reforms which became a pattern for all armies, and eventually fixed principles in our own. Letterman organized a system for the evacuation of wounded, which was placed in operation under the chaotic conditions following the seven days of fighting near Harrison's Landing. At Antietam, this system was applied with great success. By this orderly system of field service, with aid stations in close support of battalions and regiments, and an ambulance service and field hospitals in the rear of divisions, 12,000 Union and 2,000 Confederate casualties were transferred to the field hospitals in 24 hours. The Letterman plan constitutes the basis of the plan of evacuation in the United States Army today.

Another extraordinary medical officer whom the Civil War brought forward was Surgeon General William A. Hammond (q.v.). He was the first to hold the rank of brigadier general with its pay and emoluments. Surgeon General Hammond, despite his unfortunate conflict and prolonged controversy with Secretary of War Edwin M. Stanton, was the strong man of the Medical Department in those days of stress. Under his administration the general hospitals were placed under the control of the surgeon general and, in May 1862, the Army Medical Museum was established. Hammond also recommended the foundation of the Army Medical School in 1862, an ideal consummated by George M. Sternberg (q.v.) in 1893; recommended a permanent hospital and ambulance corps for the Medical Department, and independent transportation for the medical service; and succeeded in placing volunteer medical officers under the direction of the surgeon general. Hammond's administration was singularly effective, although marred by his dismissal by general court-martial Aug. 30, 1864. The findings and sentence were annulled, however, and Hammond was made a brigadier general on the retired list in 1878.

Following the Civil War, there was, as in all previous American military history, a general demobilization, followed by a reorganization of the Regular Army. From this time until the outbreak of the Spanish-American War, very little was accomplished in the field of army medical service.

The outstanding events during the period were the establishment, by act of Congress, of the Hospital Corps, composed of men enlisted by the Medical Department for medical service exclusively, and the establishment of the Army Medical School in 1893 for the training of regular medical officers in military medicine and surgery, with particular reference to preventive medicine. George M. Sternberg, who was surgeon general from 1893 to 1902, was the American pioneer in bacteriology and a lifelong worker in public health. He discovered the pneumococcus bacterium independently of, and almost simultaneously with, Louis Pasteur. Sternbergs' *Manual of Bacteriology,* issued in 1893, was a landmark of the science in America. Throughout most of his career, General Sternberg was a student of, and a writer on, yellow fever. It was he who appointed the commission, of which Walter Reed was head, to study yellow fever in Cuba after the Spanish-American War.

In spite of Sternberg's scientific attainments, the Medical Department, like the rest of the country, was totally unprepared for the Spanish-American War. Our military forces, distributed in small commands throughout the United States, had had no military training in large units. The medical service was organized on the post basis, without plans or preparations for expansion of personnel and procurement of supplies. The strength of the army was barely 25,000 and the Medical Corps numbered 192 officers.

During this war Congress made no provision for an increase in the regular Medical Corps, except for 15 assistant surgeons. The war was fought largely by volunteers. The act of April 22, 1898 authorized 8 corps surgeons, 110 division and brigade surgeons, all volunteers, and 650 contract surgeons. The strength of the Hospital Corps was 6,000. Approximately 2,500 medical officers and 22,500 hospital corpsmen were needed. Consequently, the medical service was totally inadequate and the results appalling. This breakdown in medical administration was due in part to the meager equipment and personnel allotted the army on a peace footing and, in part, to the fact that the war was entered upon without previous planning or forethought. The findings of the Dodge Commission (Grenville M. Dodge, q.v.) appointed by President McKinley to investigate the conduct of the war, resulted in certain important changes in the organization of the Medical Department, to which Surgeon General Robert M. O'Reilly (q.v.) devoted his administration (1902–1909). These changes were to prove the main factors of success in our medical arrangements for later wars.

The Dodge Commission, as a result of its investigation, recommended for the Medical Department a larger force of commissioned officers; authority to establish in time of war a volunteer hospital corps; a reserve corps of selected trained female nurses; a year's supply of all medicines, hospital equipment, and stores for an army at least four times the actual strength, to be held constantly on hand in medical supply depots; a better arrangement for the transportation of medical supplies; the simplification of administrative paper work; the creation of a fund for the purchase of special diets for the sick; and more adequate accommodations for the transportation of convalescent soldiers. Practically all of these recommendations were carried out during the administration of Surgeon General O'Reilly.

The military forces in Cuba, Puerto Rico, and the Philippines accomplished what they set out to do in good time and without difficulty; but the severe incidence of malarial and yellow fevers among troops in Cuba necessitated withdrawal of the army from the island, once the main object of the expedition had been accomplished. A board, composed of Walter Reed, Victor C. Vaughan (qq.v.) and Edward Shakespeare, made an exhaustive study of the typhoid fever epi-

demic in the military camps and published a very valuable report. The outstanding conclusion reached was that typhoid fever was not necessarily always a waterborne disease, and that its spread during the war was largely through intimate contact. The role of typhoid carriers was not then understood.

The appalling typhoid incidence during the Spanish-American War was the motivating influence in the Medical Department's intensive and successful search for a protective vaccination against this scourge. By 1908 the results of experimentation in the British Army in India were sufficiently promising to justify Surgeon General O'Reilly's sending Maj. Frederick Fuller Russell to England and Germany to investigate the subject. On his return Russell submitted a report on the epidemiology and control of the disease. A board of eminent members of the newly constituted Medical Reserve Corps convened to consider the subject; it recommended the use of typhoid vaccine in the army. This report was approved by the War Department and voluntary antityphoid vaccination was commenced in the military establishment in 1909. Such vaccination has been compulsory in the military service since 1911.

Environmental sanitary measures have undoubtedly had their effects in lowering the incidence of typhoid fever, yet the remarkable decrease in the admission rate of this disease from 3.53 per thousand per annum in 1908 to 0.78 per thousand in 1911 and 0.03 per thousand in 1939 is significant of the success of typhoid vaccination in the United States Army. During World War I the admission rate was 0.37 per thousand as against 141 per thousand in the Spanish-American War.

The Philippine expedition dispatched soon after the Battle of Manila Bay was a force composed of regulars and volunteers. The medical service was a regenerated organization composed of an administrative overhead of regular medical officers, volunteer surgeons, and contract surgeons. This force encountered all of the usual tropical diseases in the Philippine Islands, which caused high morbidity and mortality. Chief among these were malarial fevers, dysentery, and sprue. So excellent had been the results of vaccination on the population of Puerto Rico in 1898 that it was duplicated in the Philippines, where smallpox had ravaged the islands for centuries. There also the application of the principles of preventive medicine and practical sanitation resulted in markedly lessening the admission rate for these infectious diseases.

Important research work performed by the Medical Department of the army resulted in the demonstration by Maj. Walter Reed and his three associates, James Carroll, (q.v.), Jesse Lazear and Aristides Agramonte (q.v.), of the transmission of yellow fever by the mosquito. By a most careful and scientific investigation they positively demonstrated that yellow fever was transmitted by the bite of *Aëdes aegypti*. The revolutionary findings were put into such practical application by Gen. Leonard Wood and William C. Gorgas (qq.v.), later surgeon general, that yellow fever does not now exist in United States territory. Undoubtedly Reed's discovery and Gorgas' application of its principles in a practical way enabled the United States to build and maintain the Panama Canal, and the effects upon commerce, trade, and industry in southern United States and Central and South America have been of inestimable value from an economic as well as a humanitarian standpoint.

Two important congressional enactments affected the organization of the Medical Department between the Spanish-American War and World War I. The act of Feb. 2, 1901 radically reorganized the military system. The Medical Corps was increased and the Army Nurse Corps was established. The act of April 23, 1908 created the Medical Reserve Corps, which was the first reserve of officers, with the exception of the National Guard, that this country had ever had during its previous military history of 125 years. This was one of the most advanced steps taken in military preparedness in the history of the Medical Department. Not until eight years later did the National Defense Act of 1916 establish the Officers' Reserve Corps for each of the arms and other services. During the same period, two new corps were established as commissioned components of the Medical Department—the Dental Corps in 1911, and the Veterinary Corps in 1916.

In 1916 and 1917, during the punitive expedition into Mexico, motor ambulances were given their first trial in the military operations of the United States Army.

At the beginning of World War I, the Medical Department was better prepared than it had been for earlier wars. Its numerical expansion kept pace with the rest of the army, and its operations during World War I dwarfed all prior accomplishments, although they were, in turn, exceeded by those of World War II. The following table illustrates the expansion of the department during the two wars:

	World War I			World War II
	Apr. 6, 1917	Nov. 15, 1918	June 20, 1940	Aug. 31, 1945
Medical Corps	833	30,591	1,230	45,300
Dental Corps	86	4,620	267	14,000
Veterinary Corps	62	2,002	126	2,070
Sanitary Corps	0	2,919	0	2,500
Medical Administrative Corps	0	0	72	19,900
Army Nurse Corps	403	21,480	949	56,000
Pharmacy Corps	0	0	0	68
Medical Department Dietitians	0	0	0	1,575
Physical Therapists	0	0	0	1,300
Enlisted Men	6,619	281,641	13,628	493,000

During World War I, many problems theretofore relatively unimportant or unknown were presented. Wounds by high explosives caused a predominence of fracture requiring frontline immobilization prior to evacuations. Lacerated wounds required débridement and open antiseptic treatment with secondary closure, particularly to avoid ordinary wound infection and gas bacillus (Welch) infection. The necessity for early operation in gunshot wounds forced the establishment of surgical and evacuation hospitals as near the front as the military situation would permit. The system of evacuation was expanded for practical use in large-scale operations. The use of airplanes made new demands on personnel operating them and resulted in a new specialty—aviation medicine.

Between the two world wars, major developments in the organization and structure of the Medical Department resulted from the National Defense Act of June 4, 1920. The number of enlisted men was established at 5 per cent—raised in 1940 to 7 per cent—of the total actual

strength of the army. The proportionate basis which this act established for determining the number of officers in the Medical Department was replaced, in 1939, by allotments for each corps. One new corps, the Sanitary Corps, was established during World War I. The act of 1920 established still another corps, the Medical Administrative Corps. In addition it gave the Dental Corps the same grades and system of promotion as the Medical Corps, and reorganized the Veterinary Corps. The latter did not achieve a system of promotion parallel to that of the Medical and Dental corps until 1935. Members of the Army Nurse Corps gained relative rank in 1920. This accorded them equal rights and privileges with officers, but not equal pay or command functions.

As a result of World War I success in training officers in schools and camps for field service, the department established the Medical Field Service School in 1920. To continue the training of flight surgeons and research in aviation medicine, initiated during the war, the School of Aviation Medicine was established in 1919. At about the same time, two professional service schools in addition to the Army Medical School, were established—the Army Veterinary School in 1920, and the Army Dental School in 1922. These three schools, known collectively as the Medical Department Professional Service Schools, were redesignated the Army Medical Department Research and Graduate School in 1946.

During World War II, the Medical Department profited from its experiences of the previous war. Its problems and operations, however, were of far greater magnitude. The dispersion of military forces throughout the world in all kinds of environment intensified the problems of preventive medicine and multiplied the difficulties of supply and evacuation. New types of military operations—amphibious landings, large-scale strategic and tactical bombing, and highly mobile land warfare—presented new problems of medical support. The medical demands of a military force twice the size of that in World War I taxed the capacity of the country to supply enough physicians for both military and civilian needs. The department's success in achieving its mission in this global war is indicated by a comparison of the mortality rates of the army with those for World War I. In the earlier war, deaths from disease were 16.5 per 1,000 troops per annum; in World War II, the rate was 0.6. The respective death rates among battle casualties reaching medical facilities were 8 and 4 per cent.

World War II caused important administrative developments in the Medical Department. Advances in medicine and the increasing specialization which occurred between the two wars resulted in a trend, during World War II, toward separation of administrative from advisory and professional functions and in the extension of the consultant system, begun during World War I. Experts in particular fields of medicine and surgery, appointed as consultants, exerted a potent influence in the determination of policies pertaining to the prevention and treatment of disease. Civilian consultants, placed on a permanent basis in April 1946, gave the Medical Department during the war the benefit of the knowledge of experts in the fields of gastroenterology, cardiovascular diseases, dermatology, infectious diseases, chemotherapy, allergy, tropical diseases, and tuberculosis. Military consultants, through close supervision of the classification, assignment, and professional work of specialists, contributed to the effective utilization of these scarce types of personnel. A further contribution toward that end was the specialization of general hospitals, a procedure first used during World War I, in neuropsychiatry, general surgery, arthritis, neurology and neurosurgery, neurosyphilis, tropical diseases, trench foot, thoracic surgery, amputations, plastic and ophthalmologic surgery, vascular surgery, deep X-ray therapy, radium therapy, blindness, and deafness.

To relieve medical and dental officers from administrative and certain professional duties, the Medical Administrative and Sanitary corps were expanded and three new commissioned components were established—the Pharmacy Corps, Medical Department Dietitians, and Physical Therapists. In June 1944, an act of Congress gave all female officers of the department full commissioned status in the wartime Army of the United States. After the war, a Medical Service Corps replaced the Sanitary, Medical Administrative and Pharmacy corps, and, in April 1947, a Women's Medical Specialists Corps, composed of dietitians, physical therapists, and occupational therapists, was established in the Regular Army. The Army Nurse Corps achieved Regular Army status at the same time.

Problems in furnishing medical supplies and equipment to armed forces throughout the world led to an army-navy study in the autumn of 1944 of the possibilities of joint procurement. As a result, the Army-Navy Medical Procurement Office was established in December 1945.

The increasing importance of the functions of the Army Medical Museum as a reviewing and diagnostic center for the laboratories of the Medical Department resulted in the surgeon general's approval in November 1943 of a new designation for the establishment—The Army Institute of Pathology. The institute served as headquarters for mobile units of artists and photographers, sent into all theaters of operation to provide the Medical Department with photographs and motion pictures of nearly every phase of medical activity in combat areas.

Important advances in the Medical Department's professional functions and in its field service occurred during the war. One of the chief advances in surgical treatment was the concept of wound management which involved the "phasing" of surgical treatment. In the first phase, initial wound surgery was performed in mobile hospitals near the front lines, often within artillery range of the enemy. To bring surgical skill forward to the casaulty, the Medical Department increased the mobility of its field units and organized highly specialized teams to be shifted as the needs of the combat zone demanded. The second phase of surgical treatment, more definitive and reparative wound surgery, occurred at general hospitals in the communications zone; the third, corrective and rehabilitative surgery, at general hospitals in the United States. Of equal importance with front line surgery as a lifesaving measure were air evacuation, which played an increasingly important part as the war continued, and the use of blood plasma, whole blood, sulfonamides and penicillin in theaters of operation as well as in the zone of interior. Medical Department studies and field

trials which confirmed the effectiveness and extended the range of usefulness of penicillin bridged the gap between experimentation and practical application with unprecedented speed.

The Medical Department's success in preventing and treating diseases equaled that of saving casualties. The sulfonamides and penicillin proved effective in the prevention of meningococcal infections and complications of upper respiratory infections, and in the treatment of bacillary dysentery, gonorrhea, syphilis, and diseases caused by staphylococci, streptococci and pneumococci. The extension of established policies of immunization and sanitary discipline decreased the incidence of typhoid and paratyphoid fevers in World War II to about one seventh that of World War I. Only thirteen cases of cholera and only twelve of tetanus occurred in the entire army despite the fact that the former was epidemic or semiepidemic in a number of areas where troops were stationed, and that much of the fighting was over terrain heavily infested with the spores of tetanus. The most significant development in the control of insect-borne diseases was the adoption of DDT. It proved singularly effective in the control of a serious epidemic of typhus in Naples during 1943 and 1944 and played an important part in controlling malaria, the disease of greatest strategic importance in World War II.

Consonant with the army's mission of conserving manpower, emphasis in the care of neuropsychiatric casualties was shifted from "diagnosis and disposal" to prevention and treatment of psychiatric disorders. The effective use of a well-balanced program of physical, educational, and occupational reconditioning in the treatment of neuropsychiatric cases, and in hastening the convalescence of other patients led to the establishment in November 1946 of a physical medicine service, designed to coordinate and integrate the use of physical reconditioning, occupational therapy, and physical therapy in a well-rounded therapeutic program under professional supervision.

Since V-J Day the Medical Department has declined greatly in numbers—to 52,350 officers and enlisted personnel (October 1947). Its responsibilities are still global, however, reaching wherever American forces are stationed. The increasing importance of the Army Air Forces, reflected during the war in the growth of a semiautonomous air forces medical service, has resulted in the separation of the air forces from the army. Important organizational and operational problems in the medical services of the two forces are now in the process of solution.

Functions.—The Medical Department is a noncombatant branch of the army. Its personnel, equipment, and supplies, except those of the Veterinary Corps, are protected by the provisions of the Geneva Convention. Nevertheless, it deals with the whole combat force, and, in every tactical operation in time of war, it executes a major withdrawal in the evacuation and hospitalization of casualties. The fact that withdrawal of noneffectives must be made against the forward flow of troops and supplies, yet with the least possible interference with this flow, adds to the difficulty of the task. Casualties to be evacuated are gathered individually from all units of the field force and are neither organized nor self-supporting. Evacuation to the rear must be carried out as a piecemeal process by the successive medical echelons of higher units. Types of transportation range from the hand litter to the hospital train and airplane ambulance, and medical installations are usually located at points where the transition from one kind of transport to another occurs.

Major duties and responsibilities with which the Medical Department is now charged are as follows:

(1) The conduct of physical examinations for those entering the army.

(2) The preservation of health and the prevention of disease among the personnel subject to or assigned to army control, including the inhabitants of occupied territory.

(3) The provision of medical, surgical, and dental care, including the maintenance of prescribed medical establishments and units, for sick and wounded personnel, and the methodical disposition, including transportation, of such personnel, with prompt restoration to duty of those rendered capable and removal of those incapacitated.

(4) Proper selection, classification, and training of Medical Department personnel.

(5) The operation of a veterinary service, including both the conservation of health of public animals, and the inspection of meat and dairy food products.

(6) The procurement, storage, issue, and maintenance of medical supplies and equipment.

(7) The research and experimentation connected with the development and improvement of Medical Department materiel, equipment, and supplies.

(8) The preparation and disposition of records and reports.

In the coordination of its policies on an army-wide basis the Medical Department works closely with other branches of the Department of the Army; with the Quartermaster Corps in the development of army rations; with the Corps of Engineers in the construction of hospitals; and with the Chemical Corps in research on the medical aspects of chemical warfare. Long-existing relations with the Bureau of Medicine and Surgery of the navy have been strengthened by the inclusion of the departments of the Army and the Navy in one military establishment.

In areas in which the status of health of army personnel impinges upon general public health, as in the prevention and cure of the venereal diseases, and in measures taken to prevent the entry into the United States of communicable diseases from abroad, the Army Medical Department cooperates with the Public Health Service and with local health authorities. It receives the aid, intensified during war, of a variety of quasi-governmental and private agencies, especially in the field of medical research (see section on *Research and Development*). The National Red Cross which aided with the provision of certain medical supplies, notably whole blood, and with the recruitment of army nurses in World War II, furnishes recreational and social workers at army hospitals.

Organization.—The Medical Department of the army is now under the jurisdiction of the Department of the Army within the National Military Establishment, following the National Security Act of July 26, 1947, which united the army, navy, and air forces in a single organization. The Medical Department consists of a surgeon general, four assistants, the Medical Corps, the Dental Corps, the Army Nurse Corps, the Veterinary Corps, the Women's Medical Specialist Corps, the Medical Service Corps, Medical Department enlisted personnel, and a small number of contract surgeons. Contract surgeons are civilian physicians appointed by the surgeon general to meet emergency professional needs in situations where it is impracticable to maintain a medical officer.

Under the National Defense Act, as amended

by the Officer Personnel Act of 1947, the surgeon general and one of his assistants, who must be an officer in the Dental Corps, have the rank of major general, while the three other assistants have the rank of major general or brigadier general, as determined by the secretary of the army. The surgeon general and assistants are appointed by the president for four-year periods. They must be of the grade of lieutenant colonel or higher and must be recommended for the office to which they are appointed by a board of officers established for the purpose by the secretary of the army.

The officers of the several corps of the Medical Department and its enlisted members are distributed in all United States Army stations throughout the United States and its overseas possessions and in stations located in areas under United States Army occupation. The sanitary and health supervision at each station falls under the jurisdiction of the station surgeon, an officer of the Medical Corps, who is responsible to the station commander for all matters affecting the health of the command. He has charge of the conduct of sanitary inspections; the station veterinary activities, including the meat and milk inspections made by his veterinary assistant; the supervision of the station hospital, or dispensary, with its staff of medical and dental officers, and often nurses; the training of the Medical Department enlisted men; and, in stations having tactical organizations, the furnishing of medical personnel and supplies during training excursions in the field. Each army and major tactical force in the field also has its surgeon and medical headquarters, together with attached hospitals and other medical units.

Since most military stations and establishments in the United States fall under the control of the six army commanders of the six areas into which the country is divided, the medical activities of stations in each area come, in an administrative sense, under the Medical Department adviser to the army commander, an officer of the Medical Corps known as the army surgeon. In Panama, Hawaii, and Puerto Rico such medical supervisors are called department surgeons. On his immediate staff each army and department commander has an adviser of the Dental Corps and one of the Veterinary Corps.

Principles and policies governing the operation of the medical service of the army are promulgated by the secretary of the army as compulsory regulations. These policies are established on the advice of the surgeon general, who is a member of the technical and administrative staff of the Department of the Army. The surgeon general is thus able to formulate a uniform policy of medical service, carried into effect as a requirement by all army and department commanders through their Medical Department personnel and other subordinates, in all military stations and establishments both at home and overseas.

The operations of certain medical establishments, however, are under the direct command and administrative supervision of the surgeon general. Such establishments include the Army Medical Center (q.v.) at Washington, D. C., composed of Walter Reed General Hospital, Medical Department Research and Graduate schools, Central Dental Laboratory, Army Prosthetics Research Laboratory, and Veterinary Research Laboratory; Fort Totten Army Medical Center at Fort Totten, New York; Brooke Army Medical Center at Fort Sam Houston, Texas, comprising Brooke General Hospital, the Medical Field Service School, the Fourth Army Area Laboratory, the Surgical Research Unit, and the Central Dental Laboratory; the Army Institute of Pathology in Washington; the Army Medical Library in Washington, together with the Cleveland branch of the library; four medical depots and medical sections of certain general depots; certain specialized laboratories; and the general hospitals. The general hospitals are—in addition to Walter Reed and Brooke—Army and Navy (Hot Springs, Ark.), Fitzsimons (Denver, Colo.), McCormack (Pasadena, Calif.), Murphy (Waltham, Mass.), Oliver (Augusta, Ga.), Percy Jones (Fort Custer, Mich.), Valley Forge (Phoenixville, Pa.), William Beaumont (El Paso, Texas), Letterman (San Francisco, Calif.), Madigan (Tacoma, Wash.), and Tilton (Fort Dix, N. J.). General hospitals provide definitive treatment and prolonged hospitalization. Post, camp, or station hospitals, on the other hand, provide treatment for less serious cases of local origin for limited periods. The latter are under the command which has jurisdiction over the post, camp, or station at which they are located.

These and all other medical establishments having a more or less fixed location in the United States and its possessions, "named" units, are distinguished from the more or less mobile units designed to serve armies in the field. The latter, "numbered" units, have a standardized form of organization and include additional varieties of units appropriate to work in the field. They may be roughly divided into three categories: (1) those whose main function is to provide care and treatment (such as clearing companies and various types of hospitals echeloned farther toward the rear); (2) those whose primary purpose is to provide transportation from the battlefield at successive stages in the chain of evacuation (the medical detachments of regiments, the collecting companies, hospital-train units, ship platoons, etc.); and (3) certain ancillary units not directly concerned with the care or transportation of patients (depot companies and laboratories). As indicated above, the evacuation of sick and wounded takes place through a chain of medical stations which provide progressively more elaborate treatment as the rear areas are reached. The transporting agencies, however, from the litter bearers in the medical detachments at the front through the hospital train and other units farther to the rear, supply emergency treatment while patients are in their hands. A variety of specialized detachments (blood transfusion, auto maintenance, supply, etc.) also exist whose function is to supplement or support certain principal units in the three categories mentioned above.

The Medical Department is continuing the system of affiliated units which made effective contribution to the medical service in World War II. These units are established in civilian medical schools and hospitals. Organized and trained in a reserve status, they consist of personnel assigned to specific duties and accustomed to working together, and are therefore prepared to render efficient service whenever called to active duty.

The Surgeon General's Office.—The central bureau of the Army Medical Department is

the Surgeon General's Office located in Washington, D. C. The surgeon general is not only chief of the Medical Department but also senior medical technical staff officer of the Department of the Army. In the latter capacity he acts as medical adviser to the secretary of the army, the army chief of staff, the army general and special staffs, and other components of the Department of the Army. His command responsibilities include command of such troops and activities as may be assigned to his control by the Department of the Army.

In the absence of the surgeon general, the deputy surgeon general acts in his stead. An executive officer supervises the administrative operations of the Surgeon General's Office. Principal units of the executive office are: the administrative office, which attends to general office needs for supplies and equipment, distribution of all communications, the filing of records, and printing and duplicating services; the legal office, which serves as general counsel; and the editorial branch, which publishes the *Bulletin of the U. S. Army Medical Department*, a monthly periodical designed primarily to keep Medical Department personnel informed on developments in military medicine, including the dental and veterinary fields.

A deputy for plans has responsibility for the preparation of long-range plans and policies designed to solve major Medical Department problems. Technical aspects of plans peculiar to the work of specific divisions of the Surgeon General's Office are handled by these divisions.

The number and character of divisions and their component elements shift from time to time as various phases of the Medical Department's work increase or decline in importance. The field of work of currently operating divisions is described below.

Four divisions are concerned primarily with operations of four of the corps of the Medical Department: the Dental, Veterinary, Nursing, and Medical Service Corps divisions. The last-named division is concerned with the newly established corps of the same name which assumed the functions of the former Medical Administrative, Sanitary, and Pharmacy corps.

Five other divisions reflect the emphasis placed upon the use of civilian consultants in special fields in World War II: the Medical Consultants, Physical Medicine Consultants, Surgical Consultants, Dietetic Consultants, and Neuropsychiatry Consultants divisions. These, composed of specialists, have the responsibility of adapting to army needs the best professional practices in their respective fields.

The preventive medicine division develops and supervises programs for sanitation and prevention of disease for the army and for areas under army control, including a program for the establishment of good health conditions in industrial plants operated by the army. In addition to its analysis of disease incidence data within the army, it analyzes medical, epidemiological, and sanitary data in foreign areas insofar as they affect the army. It also supervises the medical laboratory service of the army.

The personnel division has charge of the staffing of all Medical Department activities with both military and civilian personnel through such procedures as recruitment, classification, assignment, promotion, and separation.

The education and training division plans and supervises programs for training commissioned and enlisted personnel in medicomilitary subjects and devises training aids.

The procurement of medical supplies and equipment is now handled jointly with the navy at the Army-Navy Medical Procurement Office, Brooklyn, N. Y. For the army side of the program the supply division of the Surgeon General's Office determines needs of both the army and of civilians dependent on it in occupied territories, supervises procurement through the Army-Navy Medical Procurement Office, and supervises distribution through the chain of medical supply depots and using agencies.

The hospital division plans and supervises the operations of the program for the evacuation of the sick and wounded and for their hospitalization. It also makes recommendations concerning the construction, lease, and maintenance of army hospitals.

The resources analysis division attempts to match requirements of the Surgeon General's Office as to personnel and facilities with the available resources.

The medical statistics division analyzes statistics pertaining to the health of the army and reports its findings.

The special projects division handles medical problems incident to the development of special weapons.

The fiscal division maintains accounts pertaining to the expenditure of Medical Department funds, makes budget estimates, and prescribes fiscal standards and procedure.

The Medical Research and Development Board (see below) has functions which are sufficiently indicated by its name.

Medical Department Officer Corps.—The Medical Department of the Regular Army comprises six officer corps. There are also now on duty Reserve officers and officers temporarily commissioned in the Army of the United States in each of these corps. The Officer Personnel and the Army-Navy Nurses acts of 1947 established the quotas and the promotion regulations for the Regular Army segments of these corps. Thus the Army Nurse Corps has a Regular Army authorized strength of six per thousand of army strength, and the Women's Medical Specialist Corps a strength of nine tenths per thousand. Individuals may be commissioned in other Regular Army corps in such numbers as the service may require with the general limitation that the total number of Regular Army officers in all branches of the army must not exceed 51,000. The Officer Personnel Act established separate promotion lists for the Regular Army members of the Medical, Dental, Veterinary, and Medical Service corps; their promotion is based on length of time in grade and past performance for all grades above first lieutenant, as in the case of all other Regular Army officers. However, to compensate for the extra years of education required by their profession, officers appointed to these lists after Jan. 1, 1948 receive constructive service credits for promotion purposes. These credits amount to four years for physicians, three for dentists, two for veterinarians, and three for members of the Medical Service Corps possessing a degree of doctor of philosophy or comparable degree recognized by the surgeon general in a science allied to medicine. Officers commissioned in the Regular Army in these corps during 1946 and 1947 received service credits based on age and military

service to assure them proper grade and seniority on their list. Officers receiving Regular Army appointments in the Veterinary, Army Nurse, Medical Service, and Women's Medical Specialist corps are credited with an amount of service equivalent to the period of active commissioned service performed subsequent to Dec. 31, 1947, up to a maximum of five years. All Regular Army officers must take an annual physical examination to qualify for continued service, and all such officers in the Medical, Dental, and Veterinary corps must pass a professional examination as one prerequisite to promotion. In most branches of the Regular Army officers are appointed without reference to the corps in which they serve. In the Medical Department, however, appointment is made to a specific corps. Base pay and allowances of all officers are fixed in the Pay Readjustment Act of 1942, as amended in 1946.

All officers in the Medical Department are classified for service to conform with their training and experience in civilian and military life. Every effort is made to give professional rather than administrative assignments to those desiring and qualified to perform them. Medical and Dental corps officers are encouraged to seek certification by the specialty boards in order to achieve the highest standards of professional competence.

Medical and Dental Corps.—These commissioned components of the Medical Department comprise groups of graduate physicians and dentists. Appointees to these corps must be graduates of a medical or dental school acceptable to the surgeon general and legally authorized to confer the degree of doctor of medicine or doctor of dental surgery, or its equivalent. A candidate for the Medical Corps must also have had an internship acceptable to the surgeon general, or its equivalent in practical or professional experience as determined by the surgeon general. Minimum age for a Regular Army appointment is 21 years, and candidates for grade of first lieutenant may not be over 32 years of age, except by special permission. Above first lieutenant the grade to which a person is appointed is determined by his age and amount of professional practice, including residencies and postgraduate training; no commissions are granted in the Regular Army in grades higher than colonel. By an act of Congress (1947), Regular Army officers of these two corps receive supplemental pay of $100 a month; all other members receive the same amount if they volunteer for a year of active duty.

Veterinary Corps.—Applicants for commission in this corps must have been graduated from a veterinary school acceptable to the surgeon general and legally authorized to confer the degree of doctor of veterinary medicine, or its equivalent. Minimum age for Regular Army appointment is 21 years, and maximum 32; however, the maximum age limitation for any person who served in the armed forces of the United States prior to Sept. 2, 1945 may be waived by the secretary of the army until June 30, 1953. Applicants for Regular Army commissions must complete a one-year period of trial service, and initial appointments are ordinarily made in the grade of second lieutenant. After one year the officer is promoted to first lieutenant, and subsequently to higher grades according to the promotion schedule.

The duties of Veterinary Corps officers fall into two general classes: those pertaining to the inspection of foods of animal origin for consumption by the army, and those having to do with the care and treatment of army animals. The members also train and direct the enlisted personnel of the Medical Department assigned for duty to the corps, investigate and make recommendations on the hygiene and sanitary conditions of the animals of the army, and inspect forage when procured, stored, and issued. As the number of animals used in the army has decreased, food inspection has assumed relatively greater importance. This includes methods and procedures by which such foods are transported, stored, and made available for troop consumption.

Medical Service Corps.—This corps consists of four sections, the names of which suggest the functions performed: pharmacy, supply, and administration; medical allied sciences; sanitary engineering; and optometry. The corps performs such functions as the secretary of the army may prescribe, and he may create such other sections as he deems necessary. Grades range from second lieutenant to colonel. With certain exceptions the minimum age for Regular Army commissions is 21 years and the maximum 30. Each applicant must complete a one-year trial tour of active duty.

Army Nurse Corps.—Original Regular Army appointments to this corps are given to those women who are between the ages of 21 and 27 years inclusive, who have been graduated from a school of nursing approved by the surgeon general, are registered nurses, and members of the Army Nurse Corps Reserve. Such applicants must be unmarried and are appointed in the grade of second lieutenant. Grades in this corps range to lieutenant colonel, except for the chief, who holds the temporary rank of colonel during her four-year term. Retirement is authorized, although not mandatory, after 20 years' service in the corps.

Women's Medical Specialist Corps.—Minimum and maximum age limits for initial Regular Army appointments in this corps are 21 and 28 years respectively. Such applicants must be college graduates and have additional training prescribed by the surgeon general. Dietitians supervise the preparation of food, including special diets, for patients in army hospitals. Physical and occupational therapists, acting upon the prescription of a medical officer, perform or supervise physical or occupational treatment of patients and train personnel of the Medical Department in such techniques.

Officers' Reserve Corps.—This component of the army consists of commissioned civilians qualified and willing to serve as officers in times of emergency. Each of the six corps in the Medical Department has its section in this reserve. In this interim period between hostilities and the final establishment of our peacetime army, not all policies relating to the Officers' Reserve Corps have been settled (1948). Grades range from second lieutenant to general officer. Anyone honorably discharged from service during World War II in commissioned status, or from the first three grades of noncommissioned rank, is eligible for appointment in the Reserve. Appointment holds good for five years and may be renewed. At present any officer may, with his own consent, be ordered to active duty for such time as the president may prescribe. In time of national emergency, declared by Congress, he may be so ordered without his consent. An officer in this

corps receives the pay and allowances of his grade while on active duty. Retirement age is 60 years.

The Honorary Reserve consists of officers retired from the Regular Army on account of age, those who have completed 20 years' service in the Reserve Corps, and those who have become physically disqualified through no fault of their own.

The Officers' Reserve Corps forms the largest source of expansion to meet emergencies short of war, and with the increase of the army, beginning in 1939, Reserve officers of all sections, including those in the Medical Department, were called to active duty in ever-increasing numbers. They formed the bulk of officers on active duty at the time of Pearl Harbor. Classification of Medical Department Reserve officers according to civilian and military experience was initiated in 1940, and these officers performed practically every type of duty called for in the Medical Department.

Consulants.—Highly trained specialists, either civilian or military, may be designated as consultants in the Medical Department. Consultants are assigned to the surgeon general, the surgeons of the Department of the Air Force, Army Ground Forces, and major commands, and the commanding officers of hospitals and other medical installations. In the general hospitals a large part of their time is occupied with the graduate instruction of Medical Department officers. Elsewhere they act as advisers and assistants in evaluating and improving the quality of medical and surgical treatment and preventive medicine. About 1,000 consultants, mostly civilians working on a part-time basis in the general hospitals, are now employed by the Medical Department.

Medical Department Insignia.—The distinguishing emblem of the Medical Department, exhibited on the guidons of its organizations and worn as insignia on the uniform of its members, is the caduceus. As an openwork metal pin on the lapel of officers' uniforms, this device is worn plain by Medical Corps officers or has superimposed upon it small letters identifying those belonging to the other Medical Department corps; as Dental Corps (D); Veterinary Corps (V); Army Nurse Corps (N); Women's Medical Specialist Corps (WS intertwined); Medical Service Corps (MS intertwined); and Contract Surgeons (C). For the Women's Medical Specialist Corps and the Medical Service Corps the caduceus is silver plated; for all others, gilt. Enlisted personnel wear a solid metal button with an unadorned caduceus in high relief.

Training.—The rapid (almost precipitous) demobilization of the army at the close of World War II and the implementation of the army-wide, long-range "Gerow-Board plan" for the postwar training of officers required of the Medical Department not only a drastic consolidation of its facilities for formal training but also a radical revision of its wartime educational system both for officers and enlisted men.

Except for the tactical training of units under control of the Army Ground Forces and on-the-job training received in all Medical Department installations, the Army Medical Department, within two years after the end of hostilities, had concentrated most of its formal training at the following centers: the Medical Field Service School (Brooke Army Medical Center, Fort Sam Houston, Texas), the Army Medical Department Research and Graduate School (Army Medical Center, Washington, D. C.), the Medical Department Meat and Dairy Hygiene School (Chicago Quartermaster Depot, Chicago, Ill.), the St. Louis Medical Depot (St. Louis, Mo.), five general hospitals within the United States, and one hospital in the Canal Zone operated by the civil government but staffed by army medical officers. Additional Medical Department training was being given at numerous civilian medical schools and in certain army hospitals in Europe. By the early months of 1948, the postwar training program of the Army Medical Department was about 75 to 80 per cent operative. Since the plans were firmly drawn, however, it was expected that the program would soon be functioning at capacity.

Departing from its practice during most of World War II the postwar Medical Department does not give basic training to newly enlisted men. Instead, enlisted personnel destined for service as medical soldiers receive basic military training for about three months in one of the four training divisions of the Army Ground Forces. At the conclusion of this training a certain number of enlisted men are assigned to the Medical Department either as replacements (who immediately start on-the-job training), or as candidates for advanced training in medical and related subjects in the several service schools operated by or in cooperation with the Medical Department. Replacements, if qualified, are also encouraged to take advanced training.

As markedly demonstrated during World War II, one of the most important training agencies producing medicomilitary manpower is the Reserve Officers Training Corps program conducted in selected four-year medical schools. Approximately twice as many medical schools as in prewar years are participating in the revival of this program, and plans call for its early extension to schools which will train officers for the Dental, Veterinary, and Medical Service corps reserve. The selected medical schools and the Department of the Army assume joint responsibility for the operation of the ROTC units. A medical officer of the Regular Army, serving as instructor in military science and tactics, is assigned at each school to conduct the medicomilitary instruction; for its part the school insures a membership of at least 50 students—all of whom must be citizens of the United States and physically suitable for military service—and provides for 90 hours of instruction each year in certain medicomilitary subjects. Membership in the ROTC units is generally voluntary. Prescribed courses of instruction, which incorporate war-learned lessons in such subjects as medical aspects of atomic energy, preventive medicine, health and national security, military psychiatry, and field medicine and surgery, extend throughout the four years of medical school curriculum, the first two years of which constitute the basic and the last two the advanced course. Attendance for six weeks at a summer training camp is also required. Subject to availability of funds, selected individuals who complete the basic are enrolled in the advanced course and receive a nominal compensation for their attendance. Upon completion of the advanced course and upon recommendation of the instructor in military science and tactics and the school authorities, the ROTC graduate is given a commission in the Medical Corps Reserve of the army. Qualified reservists, like other graduates

of approved medical schools, may then apply for a commission in the Regular Army.

All Medical Department officers newly commissioned in the Regular Army, unless excused because of prior service, will be required under the postwar program to take military training in a four-month "basic branch course," the first class of which is scheduled to begin in September 1949. A similar eight-week basic course for Medical Department female officers is planned to run twice annually for army nurses and for members of the Women's Medical Specialists Corps. After completion of such basic military training, an officer may be assigned at once to duty, or he may either then or later be selected for advanced training in medical or related subjects.

Selected enlisted personnel of the Medical Department are given advanced training in medical and allied subjects at an appropriate service school. Some are instructed, for example, in the procedures of pharmacy, dental laboratory, medical laboratory, or X-ray; others are trained as medical, surgical, or neuropsychiatric technicians or as psychiatric social workers' assistants, electroencephalographers, physical reconditioning instructors, or medical aid men. Still other enlisted men are given in-service training as specialists in the repair of medical equipment, as opticians, or as inspectors of meat and dairy products.

Medical Department officers, with proper approval, may receive advanced professional or related training at service schools, at civilian institutions, and at the newly designated "teaching" hospitals. In the service schools an army medical officer may take a course in the basic sciences; a Medical Service Corps officer may elect to study physical reconditioning, clinical psychology, hospital administration, or psychiatric social work—or he may choose to train as an optician, a supply officer, or a medical equipment maintenance officer; and a hospital dietitian of the Women's Medical Specialists Corps may enroll in a class in mess administration. Similarly, Veterinary Corps officers and army nurses may take service school courses appropriate to their professions. When unavailable at service schools, furthermore, courses in the professional specialties, such as internal medicine, thoracic surgery, or obstetrics; in dentistry; and in other fields related to the duties of Medical Department officers, such as business administration, bacteriology, public health, or sanitary engineering, may be secured for limited periods under army contract with an approved civilian institution offering the course desired.

The development in this postwar graduate professional educational program expected to produce the greatest improvement in professional service rendered by the Medical Department is the establishment of internships and residencies in the six teaching hospitals—Brooke, Fitzsimons, Letterman, Oliver, and Walter Reed General Hospitals in the United States, and Gorgas Hospital in the Canal Zone. Although by early 1948 no one of these hospitals had residencies approved in all of the professional specialties, collectively they had available for Regular Army Medical Corps officers, and for applicants for the Regular Army, programs of one- to three-year residency training in each of the following fields: cardiology, contagion and tuberculosis, dermatology and syphilology, internal medicine, physical medicine, anesthesiology, obstetrics and gynecology, ophthalmology, orthopedic surgery, otolaryngology, surgery, thoracic surgery, urology, neurology, pathology, psychiatry, and radiology. All of these residencies by early 1948 had been approved, some temporarily, many permanently, by the American Medical Association's Council on Medical Education and Hospitals and by the American Specialty boards. Several of the hospitals had residencies, notably in pediatrics, approval of which had been recommended by the council but which had not been acted upon by the appropriate specialty board. Some had established residencies in certain specialties pending approval of the accrediting agencies. All six had internships that were permanently approved.

General direction of the program for the training of residents and interns is vested in a committee of professional experts in the Office of The Surgeon General. The program in each hospital, under the local direction of the hospital education committee, is so organized as to be carried out by a professional staff of assigned Medical Corps officers and attending civilian consultants who are diplomates of, or are acceptable to, the particular specialty board concerned. The third- and second-year residents, too, are expected to supervise and instruct the interns and residents who are less experienced than they. Instruction is accomplished through bedside and general conferences with, and supervision by, the assigned and attending professional staff; through training in the allied sciences, which may be taken locally in civilian institutions; and through individual research projects. Residents completing the prescribed course of study are eligible to take the examinations for certification by the appropriate American Specialty board.

All Regular Army medical officers, if possible between the third and tenth year of their active service, are expected to attend the advanced branch course, which is divided into two phases: the four-month tactical and administrative phase, to be given at the medical Field Service School; and the professional phase, extending from four to nine months, depending upon the type of specialized training, which is to be given at the Army Medical Department Research and Graduate School.

All training opportunities afforded Regular Army officers, except residency training, are also available to Medical Department officers in the Officers Reserve Corps and National Guard.

Beginning in January 1948, the Medical Department instituted in overseas hospitals a program offering advanced training and experience, analogous to residency training, in the various special fields of medicine and surgery to qualified Reserve officers, regardless of prior military service, who applied for extended active duty.

Finally, a limited number of Medical Department officers, in preparation for positions of great responsibility, are usually sent annually to four high-level service schools. Some attend the ten-month courses at the Command and General Staff College, the National War College, or the Industrial College of the Armed Forces. Others take the five-month course offered at the Armed Forces Staff College. Seldom does any one officer, however, receive advanced training at all four of these institutions.

Research and Development.—Medical Department scientific activities are directed primarily toward discovery of more effective methods for prevention or eradication of conditions that may jeopardize the success of troops during military operations. These activities, like scientific work

n general, are divided into two main categories: (1) research, involving the discovery of basic principles of medical phenomena, and the application of these principles, generally comprehending discovery of a novel product, process, or technique, and (2) development, in which experimental production and testing is performed on products, processes, techniques, or devices that previously have been discovered or invented. Applied research and development receive the main emphasis.

A considerable amount of scientific work is carried on in the hospitals, laboratories, and testing installations of the Medical Department, as well as in its schools, incidental to, or in close relationship with their ordinary professional duties. The large number of specialized centers for treatment of disease, injuries, and wounds, which are organized in wartime, afford great opportunities for clinical observations. Unfortunately, time does not always permit these opportunities to be used. Before World War II, however, an organized, comprehensive, and long-range program of research and development was scarcely known in the Medical Department. In earlier years, particularly, it was customary to assign research problems to temporary boards or commissions of medical officers. Among the most notable of these were the boards for the study of tropical diseases set up in Cuba and the Philippines soon after the end of the Spanish-American War. Between World War I and World War II, a number of more permanent units specializing in research and development existed. A Medical Department Research Board functioned in the Philippines from 1922 to 1934, when it was transferred to Panama. There, under the name of Army Medical Research Board, it operated until 1939. Although the board conducted investigations into a variety of subjects, it devoted its chief attention to tropical and animal diseases, and not only demonstrated the exact mechanics of transmission of dengue by *Aëdes aegypti*, but also developed a vaccine which was effective in eliminating rinderpest from the Philippines.

Nearly half of the Medical Department's research and development units of the between-wars period (those concerned with aviation and chemical warfare medicine) functioned, at least in part, under the jurisdiction of other branches of the army, and even, in the case of aviation medicine, with funds not provided by the Medical Department. The beginnings of an attempt to integrate the scientific program of the department occurred in 1937, when a research coordinating board to investigate diseases and conditions affecting health, efficiency, and longevity of army officers, and to coordinate other medical research programs was established in the Office of The Surgeon General.

With the coming of World War II, increasingly large appropriations were made from Medical Department funds for research and development, particularly after the United States entered the conflict. Studies were initiated in the field of communicable diseases, and, toward the end of the fighting, in the development of devices to aid the disabled. New facilities were created within the Medical Department for investigation of respiratory diseases, of industrial hygiene, and the physiology of the armed forces. However, for much of the more fundamental study required by the war, the Medical Department, because of the great pressure on the time of its personnel, relied upon contracts with universities and medical schools as well as upon projects organized by the National Research Council (q.v.) and the Committee on Medical Research of the Office of Scientific Research and Development.

The postwar research and development program has attained a magnitude and scope unprecedented in peacetime. Whereas, during the fiscal year 1938–1939, $14,500 of Medical Department funds were specificially obligated for this purpose, the corresponding amount set aside for the fiscal year 1947–1948 was (as of December 1947), $3,100,000. Studies are made on the medical aspects of operations under climatic extremes, physical and mental standards for the most effective selection and employment of personnel, care and rehabilitation of casualties, prevention and treatment of infectious and parasitic diseases of military significance ordinarily not found among civilians, and adaptation of medical supplies and equipment both to scientific advances and to changing military practices.

World War II brought increasing centralization in the control of Medical Department scientific activities. To integrate such work a series of agencies in the Office of The Surgeon General replaced the weak coordinating board. This process culminated in the organization, in July 1945, of the Army Medical Research and Development Board. The membership of this unit, which, since the middle of 1947, has been known as the Medical Research and Development Board, includes the chiefs of the more important professional units of the Surgeon General's Office, the chief of the supply division, the ground surgeon, and the air surgeon. The mission of the board is to formulate and supervise a coordinated research and development program of prospective benefit to army medical equipment and practice, to adapt to the needs of the military service the best techniques and devices produced by private medical research, and to coordinate the Medical Department's research program with those of all appropriate government agencies.

Functioning under the general direction and supervision of the Medical Research and Development Board is the Army Epidemiological Board, established early in 1941 to provide the surgeon general with consultative service on influenza and other infectious diseases as well as to organize research in these fields. The board consists of civilian consultants and has under it five commissions, likewise civilian in membership, which deal respectively with acute respiratory diseases, influenza, virus and rickettsial diseases, immunization, and environmental hygiene.

The Medical Research and Development Board also finances and controls a number of installations engaged in research work. These include research units of the school at the Walter Reed Army Medical Center (called Army Medical Center until Sept. 13, 1951). The school divisions were among the army's oldest medical research establishments. They were redesignated the Army Medical Department Research and Graduate School in January 1947. Their studies cover medical and surgical practice, preventive medicine, and diagnostic methods, as well as development of vaccines. The board also has direct control over the Army Prosthetics Research Laboratory, which was established as part of Walter Reed General Hospital in September 1945 and later made a separate component of Army Medical Center, and the Brace Research subsection of

the Hospital's Orthopedic section, which originated in a project authorized in August 1945. The board likewise controls the Medical Nutrition Laboratory, which was orginally situated at Army Medical Center and was transferred to Chicago under an order of September 1944, and the Surgical Research Unit, established about the beginning of 1947 at Brooke General Hospital. Studies carried on at the Surgical Research Unit look toward the development of new antibiotics and their surgical application. The Medical Department Field Research Laboratory was founded at Fort Knox, Kentucky, in 1942, and was originally devoted to studies of the physiological and psychological aspects of armored warfare. In February 1944 it was transferred from the jurisdiction of the Army Ground Forces to that of the surgeon general, and now operates under the Research and Development Board. Since the activities of the establishment soon were broadened to include many other aspects of what may be called military occupational hygiene, its name was changed, effective April 1, 1947, from Armored Medical Research Laboratory to Medical Department Field Research Laboratory.

The Medical Department Equipment Laboratory, which was established at Carlisle Barracks, Pennsylvania, in 1920, was made an attached activity of the Army-Navy Medical Procurement Office in February 1946. In June of the same year, it became a component of that office and was redesignated as the engineering development division. The laboratory and shop branch of this division was moved from Carlisle Barracks to Fort Totten, New York, toward the end of 1947. In its new status, the engineering development division continues to play an important role in the program of the Medical Research and Development Board. It is primarily concerned with developmental work on field equipment, such as mobile units, medical chests, dental engines, and operating lamps for the army, navy, and air force. The Medical Research and Development Board also uses hospitals and other Medical Department establishments as occasion may warrant. Among these is the Army Institute of Pathology (see below) which long has had the function of conducting research on the material in its collections. Finally, the Medical Department continues to carry on a large part of its research by means of contracts with universities, medical schools, and other government agencies. Investigations so arranged are those which cannot feasibly be done within the service. They generally involve the more fundamental aspects of research.

Research is also performed under the supervision of Medical Department personnel at the medical division of the Army Chemical Center, Edgewood, Md.; on July 15, 1943, the Medical Department Research Laboratory, located at Edgewood, was transferred from the jurisdiction of the surgeon general to that of the chief of the Chemical Warfare Service. Two former army centers for research in aviation medicine, the School of Aviation Medicine at Randolph Field, San Antonio, Texas, and the Aero-Medical Laboratory, at Wright Field, Dayton, Ohio, are now under the jurisdiction of the Department of the Air Force.

The Medical Department's statistical and medical intelligence programs constitute important auxiliaries to its research and development work. Medical intelligence involves the gathering and analyzing of information concerning foreign discoveries of importance to military medicine and health conditions and medical facilities in areas abroad which may be the scene of American troop operations.

Army Institute of Pathology.—This institute comprises four departments. The *Department of Pathology* serves as the central laboratory of pathology not only for the army but also for the Veterans Administration. Here many surgical specimens and all of the autopsy materials from these two sources are analyzed and original diagnoses are verified or corrected. The department also provides Medical Department officers and other qualified physicians with instruction in pathologic anatomy. The *American Registry of Pathology,* sponsored by the National Research Council, forms another of the departments of the institute. The registry comprises pathologic materials and records brought together through the cooperation of national societies in the various medical specialties. This material, together with that obtained through official channels, raises the number of accessions in the custody of the institute above 200,000. The *Army Medical Illustration Service* serves as a central agency for collection and reproduction of medical illustrative material for the army and the civilian members of the profession. A collection of about 400,000 negatives has been amassed. The service supervises the activities of the Clinical Photographic Laboratories of the Army hospitals in the United States, and receives from them moving picture films as well as "stills." It maintains a Photographic Department, dating almost from the Civil War, which pioneered in photomicrography. One of its most valuable activities is the presentation at scientific meetings and similar gatherings of exhibits on a wide range of medical subjects. The *Army Medical Museum,* which is the fourth department of the institute, is the only establishment of its kind which is open to the general public. The world's largest aggregation of war wounds, contrasting the effects of arrows, tomahawks, small arms, high explosive shells, and gases, is in the custody of the museum, but its accessions comprehend all forms of injuries and diseases. Medical medals, microscopes, stethoscopes, and other diagnostic instruments also are among the collections.

Army Medical Library.—The library of the Surgeon General's Office, known since 1922 as the Army Medical Library, has long been the largest medical library in the United States. Its growth as a great research facility dates from the post-Civil War period when Dr. John Shaw Billings (q.v.) was placed in charge of it and surplus hospital funds were allotted by the surgeon general for its expansion. With the momentum thus provided, the library, whose collection, covering not only the field of medicine, but also various related sciences, has become so large and so well known that it often is referred to as the National Medical Library. It possesses over 1,000,000 items, including at least 500,000 bound volumes, and provides reference service not only to the armed services, but also to physicians, institutions, and libraries throughout the country.

The function of the library is to collect the medical literature of the world regardless of language, form, or date of publication. It possesses a great number of the earliest printed works, including over 500 incunabula, early manuscripts from European and Oriental sources, and a medical art collection containing approximately 12,000 items.

One of the most important recent developments in the history of the library is the growth of its photoduplication and microfilm service. This is operated for the benefit, not only of the Medical Department, but also of the medical profession at large.

The Index-Catalogue of the library was formally established by Congressional Act of 1879. This publication, now in its fourth series (inaugurated in 1936), has become the "foundation for medical library service both here and abroad." Thus far 56 volumes have appeared. Since September, 1945, the library also has been publishing the *Current List of Medical Literature*. Inaugurated in 1941 by Atherton Seidell under the sponsorship of the Medical Library Association, this publication is issued weekly and is supplemented by a monthly subject index.

Inadequate appropriations and antiquated quarters (dating from 1887) have made it difficult for the Army Medical Library to provide completely satisfactory service. In 1943, a committee of civilian authorities on libraries recommended far-reaching changes, including a complete recataloguing of the library's holdings. Since then, the recataloguing project has been inaugurated, the personnel has been virtually doubled, and steps have been taken to provide the staff with more men and women trained in library work. The urgent recommendation that a new building, to house the equally cramped Army Institute of Pathology as well as the library, be constructed, remains unfulfilled, but, to some small extent, the pressure on space has been lessened by the establishment of the history of medicine division in Cleveland in 1942, to which rare items were removed for greater security against possible enemy action. Another unit of the library is the historical division, which carries on the tradition of the Medical Department, established after the Civil War and continued after World War I, of preparing comprehensive accounts and evaluations of the department's experiences during major conflicts.

HISTORICAL DIVISION,
Army Medical Library.

MEDICAL ORGANIZATION, United States Navy. The Medical Department of the navy is administered by the Bureau of Medicine and Surgery which is one of the seven bureaus of the Navy Department. It is charged with and is responsible for maintaining the health of the navy through the promotion of physical fitness, the prevention and control of diseases and injuries, and the treatment and care of the sick and injured. The responsibility for coordinating and integrating the administrative and professional functions of the Medical Department is vested in the surgeon general of the navy who is the chief of the Bureau of Medicine and Surgery. These functions are carried on by the personnel of the following corps which constitute the Medical Department: Medical Corps, Dental Corps, Medical Services Corps, Nurse Corps, Hospital Corps, and by the civilians in the bureau and in the field activities.

The maximum personnel allowed for each of the corps is prescribed by law as a percentage of the total officer and enlisted strength of the United States Navy and Marine Corps, but insufficient appropriations have in the past sometimes prevented employing the total authorized officer strength. On the other hand, since World War II, the difficulty has been in finding enough candidates to keep the Medical and Dental corps up to authorized strength. The percentage allowances, with the corresponding actual numbers based thereon that were authorized for the fiscal year 1948, are as follows:

Corps	Allowance in percentage of total officer and enlisted strength of the Navy and Marine Corps	Authorized strength in actual numbers for fiscal year 1948
Medical Corps	0.65%	3,092
Dental Corps	0.2 %	952
Medical Services Corps	0.13%	618
Nurse Corps	0.6 %	2,854
Hospital Corps	3.5 %	14,910

Medical Corps.—Appointments to the Medical Corps are normally made either in the grade of assistant surgeon with the rank of lieutenant (jg), or in the grade of acting assistant surgeon, also with the rank of lieutenant (jg). In both cases such appointments are made after a competitive examination, which is held in June of each year. Candidates must be between the ages of 21 and 32. In order to enter the examination for appointment as an assistant surgeon, the candidate must be a graduate of an accredited medical school and must have had an internship in a civilian hospital. For appointment as an acting assistant surgeon, the candidate must have completed the fourth or senior year in an accredited medical school, but is not required to have had an internship. Those who enter as acting assistant surgeons are assigned for one year to an internship at a naval hospital. Should the intern at the end of the year desire to return to the practice of medicine in private life, his appointment as an acting assistant surgeon is terminated and he is honorably discharged from the naval service. If he desires to continue in the naval service, he must pass a further competitive examination.

The professional examination for assistant surgeons embraces the subjects of general medicine, general surgery, obstetrics and gynecology, preventive medicine, and medical jurisprudence. The professional examination for acting assistant surgeons covers only the subjects of general medicine and general surgery, in addition to an oral and practical examination. Each candidate must also pass a prescribed physical examination.

Under certain circumstances to meet special needs of the navy, medical officers may be commissioned from the Naval Reserve or from civilian life in higher age groups and in higher ranks up to and including the rank of captain. The same provision applies also to the Dental Corps.

The ranks in the Medical Corps are lieutenant, junior grade; lieutenant; lieutenant commander; commander; captain; and rear admiral. Promotion is by selection made by a board of medical officers but, before being advanced in rank, the officer must also pass physical, mental, moral, and professional examinations.

Dental Corps.—The requirements as to age, professional education, examinations, etc., for appointment to the Dental Corps parallel those for the Medical Corps, although there is no requirement as to actual practical experience corresponding to the internship requirement for medical officer candidates. The same ranks are also provided, with the number of rear admirals limited to four, as the Dental Corps is numerically less than one third the size of the Medical Corps. Promotion is by selection.

Medical Services Corps.—This corps was established by an act of Congress in 1947 to fill needs brought to the front by the experience of World War II. Modern warfare has become so highly scientific and technical that specialists in many fields besides medicine are needed to make it possible for the Medical Department of the navy to perform its functions satisfactorily. Some twenty specialties that are recognized as separate sciences will be represented in this corps. Such a corps makes it possible also to provide careers for men that are highly competent to handle administrative and medical supply work, which formerly took up much of the time of medical officers to the detriment of their professional work. The act provides that the Medical Services Corps shall consist of a medical allied scientists section; a pharmacy, supply, and administration section; an optometry section, and such other sections as may be deemed necessary by the secretary of the navy.

Members of the corps hold commissioned rank from ensign to captain. The initial recruitment of the corps was accomplished by transfer to the grade of ensign of temporary and reserve officers in the needed specialties who had served in World War II. Their rank was then adjusted with reference to the dates of their original appointments and the grades they had reached while in their former status. Subsequent appointments are being made in the grade of ensign, except that those holding doctorate degrees in sciences allied to medicine may be appointed as members of the medical allied science section with the rank of lieutenant, junior grade.

Nurse Corps.—This corps has the same status as other staff corps of the navy. Its members hold commissioned rank from ensign to commander. The director holds the rank of captain and is selected from officers in the Nurse Corps of the rank of lieutenant commander and above.

A candidate for appointment to the Nurse Corps must be single, a citizen of the United States, and between 22 and 30 years of age. The candidate must have a broad general education, preferably a college degree, but must at least have graduated from an accredited high school that provides not less than a four-year academic course. She must be a registered nurse, and a graduate of a school of nursing, the educational and professional standards of which are approved by the surgeon general.

Hospital Corps.—This corps consists of chief warrant officers, warrant officers, chief petty officers, petty officers and nonrated men. They are designated below the grade of warrant officer as chief hospital corpsman (formerly pharmacist's mate); hospital corpsmen, first class, second class, and third class; hospital man; and hospital apprentice. Commissioned officers of the newly created Medical Services Corps perform many of the administrative duties which were formerly performed by the higher levels of the Hospital Corps. The Medical Services Corps is expected to recruit part of its personnel by promotions and transfers from the Hospital Corps.

Members of the Hospital Corps perform a great variety of services and are an essential component of every combat force. The Hospital Corps may be termed the main working force of the Medical Department of the navy. The nursing on all ships is, for example, performed exclusively by the Hospital Corps except on hospital ships where the nursing staff is supplemented by female nurses. The smaller naval vessels do not carry a doctor in the medical department (a doctor and a dentist may however be assigned to a group of small ships), but scarcely any commissioned ship is so small but what a hospital corpsman is included in the crew. The hospital corpsman may in an emergency be called on to perform any of the functins which are normally within the province of a medical officer. The incidents of hospital corpsmen who, during World War II, successfully performed appendectomies on members of the crews of submarines while on war patrols in the Pacific Ocean are cases in point.

The lower ratings of the Hospital Corps spend much of their time studying and attending classes in connection with their training, and the upper ratings devote many hours teaching the lower ratings. This is necessary because there is no large calling in civilian life from which to recruit already trained hospital corpsmen.

Scope of Activities.—Medical and dental service and hospitalization are provided for all United States Navy and Marine Corps personnel whether on active duty or retired. With certain limitations, medical service and hospitalization are also provded for the dependents of such personnel. Emergency treatment is also given to the civilian employees of naval shore establishments.

The navy maintains some 30 naval hospitals, 120 dispensaries located in the continental United States, and 60 located overseas. A research laboratory, post graduate schools in medicine and dentistry, and refresher schools form part of the educational facilities provided to keep the Medical Department of the navy in the forefront of medical science..

The personnel assigned to the medical department of naval vessels depends on the size of the ship, that is, on the complement of the ship. Battleships and large aircraft carriers have two medical officers and one dental officer, cruisers, one medical officer and one dental officer, smaller ships, a medical officer but no dental officer, and destroyers, a medical officer for each division. Personnel of the Hospital Corps in appropriate numbers and ratings constitute the main body of the Medical Department complement. As already mentioned there may be no commissioned officer in the medical department of a small ship but there is always a member of the Hospital Corps.

J. A. Furer,
Rear Admiral, United States Navy (Retired).

MEDICAL PEDAGOGY. The theory of education in its application to medicine still is mostly traditional, like many of the subjects it includes, for the pedagogy of the great number of medical schools has no steady, carefully arranged and planned-for, fought-for, curriculum based on personal and educational psychology and knowledge of the modes in which a young (or old) person learns. Both the method and the curriculum at present are largely traditional, like much of medicine in general.

When systematic laboratory work developed, largely in the richer medical schools, and recitations began to be systematically held, this preceptor-system—employing a practitioner to be guide, philosopher and friend, as well as tutor—

gradually disappeared, except as still maintained n or about all institutions of learning in some form or other. In this pedagogic respect, then, he medical school tends continually to imitate nore and more successfully the didactic methods of the university, which, of course, are ancient.

«The requirements for admission to colleges nolding membership in the Association of Amer-can Medical Colleges are 14 units of high school work and two years (60 semester hours) of college work.

THE HIGH SCHOOL REQUIREMENT.

(A) Required, 7 units.	Units
Mathematics (minimum 2 years, maximum 3 years), algebra and plane geometry....	2
English (minimum 2 years, maximum 4 years)	2
One foreign language (minimum 2 years, maximum 4 years)	2
History and civics	1
Total number of required units	7
(B) Elective, 7 units.	
To be selected from the following:	
English language and literature (in addition to the required work)	1 to 2
Foreign languages, additional, Latin, German, Italian, French, Spanish or Greek (not less than 1 year in any one)	1 to 4
Advanced mathematics, advanced algebra, solid geometry and trigonometry (½ year each)	1
Natural science, chemistry 1 year, physics 1 year, and biology, botany, physiology and zoology (½ to 1 year each)	½ to 2
Earth science, physical geography, geology and agriculture (½ year to 1 year each)	½ to 1
Astronomy (½ year)	½
Drawing (½ to 1 year)	½ to 1
History, ancient, medieval and modern, and English (1 year each)	1 to 3
Economics (½ year)	½
Manual training (1 year)	1
Bookkeeping (½ to 1 year)	½ to 1

One unit in any subject is the equivalent of work in that subject for four or five periods per week for a year of at least 36 weeks, periods to be not less than 45 minutes in length. One unit is equivalent to two semester credits or two points.

PREMEDICAL COLLEGE COURSE.

SCHEDULE OF SUBJECTS OF THE TWO-YEAR PREMEDICAL COLLEGE COURSE.

Sixty Semester Hours* Required

Required Subjects:	Semester Hours
Chemistry (a)	12
Physics (b)	8
Biology (c)	8
English composition and literature (d)	6
Other nonscience subjects (e)	12
Subjects Strongly Urged:	
French or German (f)	6–12
Advanced botany or advanced zoology	3– 6
Psychology	3– 6
Advanced mathematics, including algebra and trigonometry	3– 6
Additional courses in chemistry	3– 6
Other Suggested Electives:	
English (additional), economics, history, sociology, political science, logic, mathematics, Latin, Greek, drawing.	

*A semester hour is the credit value of sixteen weeks' work consisting of one lecture or recitation period per week, each period to be not less than 50 minutes net, at least two hours of laboratory work to be considered as the equivalent of one lecture or recitation period.

Colleges may reduce the number of hours in any subject not more than 20 per cent, provided that the total number of hours in a division is not reduced. Where the teaching conditions in a college are best subserved, the subject may be, for teaching purposes, transferred from one division to another. When didactic and laboratory hours are specified in any subject, laboratory hours may be substituted for didactic hours.

Medical Education of Women.—The development of medical education for women in America gave back to the world the opportunity for feminine medical study which had been freely granted in the Middle Ages and then with so many other privileges was denied in modern times. The first woman student of medicine was Dr. Elizabeth Blackwell, who, after being refused permission to study at most of the medical colleges in the country, finally secured the privilege at Geneva, N. Y., when the faculty, feeling sure that her application would be rejected, put it before the students and they voted unanimously to admit her. She was graduated in 1849. Her sister Emily was refused two years later at Geneva, and Rush Medical College, Chicago, was censured by the State Medical Society for receiving her for a term. She was graduated at Western Reserve, Cleveland. The women resolved to found medical colleges of their own. The first of these, the Women's Medical College of Pennsylvania, was founded in 1850. It had a quasi predecessor in the Gregory School of Medicine, established to train women as midwives, founded in Boston in 1848, and lasting until 1874. The Woman's College of the New York Infirmary was opened in 1865 and closed in 1899, when Cornell opened its medical course to women students. The Women's Medical College of Pennsylvania, was founded in 1882, that of Cincinnati in 1886 and that of Kansas City in 1895.

The University of California was a pioneer in opening its courses to women in 1869 and was followed in this policy by all the universities of Western States. This development also included medicine so that the special need of medical colleges for women ceased in the West. When Johns Hopkins, Baltimore, opened its medical school in 1893 women were accorded the same privileges as men. Gradually prejudices disappeared and other medical schools opened their doors to women, but it was not until the World War brought home the need for physicians during and after the war that Harvard and Columbia removed the restrictions against women in their medical schools. In recent years medical schools in increasing numbers have opened their classes to women.

Many medical schools need, and as much as anything else at all, except it be finances, an adequate survey by some wise and practical professional educator—one who would point out, for example, some of the inconsistencies and the lack of co-ordination between the different courses. «Visiting» committees frequently try to demonstrate to chance readers of their reports their own personal importance, but they seldom have any knowledge worth while concerning educational theory. An assistant or teaching fellow in almost any university department of education would be of more use in a really conscientious medical school than the wealthiest and most dignified of these committees.

The principles of pedagogic fatigue, of overwork, and of under-recreation are ignored in most medical schools, with a consequent great waste of mental energy. As has already been hinted, the medical student needs normal recreation as much as any other student, if not more. A course in the economics of learning should be given in the first semester of every medical freshman year.

This suggests medical psychology in general. The everyday psychology of the emotions, for example, especially in relation to the functions of the body and its growth, should be studied and even understood by every medical man while yet a student. The present writer happens to be one of the early ones to say this, namely in *Science* in July 1901. Medical psychology was offered year after year, the Tufts College 1901–02 catalogue-announcement of this pioneer course being as follows: «*Normal medical psychology*—An optional course in normal medical psychology will be given to the fourth-year class in weekly lectures during the first half-year. Its aim is to discuss in their more general relations certain topics of great practical importance to the medical practitioner: such topics for example as suggestability and hypnosis, temperament, mood, the numerous habits, sexual mental differences, will-power, the emotions, pain and pleasure. Knowledge of subjects such as these prepares the student better to understand his patient as an individual and so better to treat his disease. But, in addition to this, the chief value perhaps of such information, the lectures will afford a brief basis of general psychology, which will tend to make the mental phenomena of the diseases of the mind and nervous system more easily understood» (Professor Dearborn).

In nearly a score of years the curiously inherent materialism of the medical schools has begun to soften, without a doubt, and to-day some of the very best medical colleges realize practically that education, any kind of education, that has ignored the study of mind and motive and behavior is incomplete and false in quite the most fundamental kind of way. This common lack of adequate psychology, however, seems still to be the chief pedagogical defect of medical education—man is both mind and body. Nevertheless American medical education still remains the best in the world.

MEDICAL SCIENCE AND THE WORLD WAR. Army medical departments everywhere had, before the war, prepared for the treatment of surgically clean wounds made by modern fire-arms in distance engagements. The soldiers' «First Aid» kit, with its sterilized dressings sealed from contamination, was expected to maintain this freedom of wounds from infection almost without exception. Aseptic wounds assure prompt and uncomplicated recovery. Serious injuries of important organs would still often be fatal, but all others, as a rule, would be followed by convalescence without delay or complication. These anticipations were sadly disappointed by the immediate recourse to trench warfare as almost the sole mode of conflict. In trenches recently dug in fields which had been under cultivation for hundreds of years, bacteria abounded and infections inevitably occurred. Two extremely fatal forms of infection, tetanus and gas gangrene, raged among the troops. Both of these were often fatal and the gas bacillus caused long illness and often extensive mutilation, even when recovery took place. Tetanus, after the early sad war experience, was prevented by injections of anti-tetanus serum as soon as the wounded came under observation, the injections being repeated at regular intervals if convalescence from the wound was prolonged, for it was found that delayed infections occurred. The gas bacillus proved a much more difficult problem because of the utter unfamiliarity with it at first. It was unknown in Great Britain before the war, was not seen during our Civil War, and is very rare in civil life. Some 70 per cent of the wounds received in the trenches during the first year of the war were infected by it. It was never noted in wounds of the face or neck where the blood supply is abundant and the tissues well oxygenated, for the bacillus of it, discovered by Welch at Johns Hopkins, like the tetanus bacillus, is anerobic, that is, grows best out of the presence of the air. The successful methods of treatment included thorough opening up of wounds, the use of hydrogen peroxide, so as to provide additional oxygen for the tissues, and after careful investigation, the use of serums for curative and prophylactic purposes, elaborated by various agencies.

The noteworthy difference between the healing of the wounds of soldiers and those of sailors (who were often exposed to cold sea water after the reception of their wounds) led to an important development in the treatment of large shell wounds and penetrating wounds of various kinds. The influence of salt water as a dressing for the surface of large wounds was carefully studied, and subsequently proved beneficial in many cases.

The important development in the treatment of wounds came when Dr. Alexis Carrel of the Rockefeller Institute was put in charge of a French hospital in Compiègne during the second year of the war. He set about the practical application of Lister's principles. Ordinary surgical antiseptics were too poisonous to be used for the flushing out of large wounds. A solution of hypochlorites proved to be bactericidal, yet non-toxic and non-corrosive to tissues. After experiment, Dakin's fluid, so called from the inventor of it who had been the director of the Herter Chemical Institute, New York, was found the most efficient solution of the hypochlorites. The important part of this treatment was the bacteriological control. After removal of all foreign particles and all injured tissues, wounds were thoroughly flushed with Dakin's fluid many times a day, until it was found by careful microscopic examination that the secretions contained very few bacteria and none to be feared. The wound was then closed up and permitted to heal without further interference. The results were excellent. Healing took place rapidly as a rule, convalescence was brief and absorption of septic material so as to produce constitutional disturbance rare and without danger. The after result was better than that produced by any other method and the hospitals where it was employed took on a new aspect from that which had been seen in the war hospitals before.

The most important development of the surgical treatment of war wounds has been what is called by the French *débridement,* that is the thorough excision of all injured portions of tissue. The extent to which this clearing out of the wound was carried in war practice would have seemed utterly unjustified in civil surgery before the war. Where a penetrating bullet wound shows signs of infection, a cylindrical

portion of the tissue around it is removed. In larger shell wounds, a layer of injured tissue is, as far as possible, removed from every portion of the wound so as to present perfectly fresh vital surfaces for healing purposes. Large amounts of tissue are thus often removed, for experience has shown that it is in the end ever so much better for the patient. Any injured cells allowed to remain are of low resistive vitality, have a tendency to die and then break down into material which forms an excellent culture medium for microbes. Where drainage is instituted, most of this will come away, but that is a much slower process and much more exhausting to the patient, and lowers the healing qualities of the part. It has been found by actual bacteriological observations that while very few bacteria are present shortly after the wound is infected, these multiply rapidly in the brood chamber created for them in the tissues, on the good medium for growth, while the healthy cells are handicapped by the presence of injured cells in their struggle against bacteria.

The war's experience with head injuries developed a mode of treatment quite different from that in common use before. The surprise for military surgeons was the wonderful tolerance of the brain to injuries. It was not an unusual thing to have wounded soldiers come into dressing stations as "walking cases," who were suffering from fracture of the skull, even complicated by other injuries. The best surgery for these cases proved the greatest possible limitation of intervention. Depressed bone fractures must, of course, be lifted, but missiles should not be searched for. There is least danger for the patient when the missile is left *in situ*, unless symptoms directly traceable to its presence develop. As a rule, antiseptic rather than aseptic precautions are most valuable in saving lives in these cases. The experience of four years seems to indicate that the after effects of the retention of foreign bodies within the skull does not justify manipulations in reaching them.

The use of poison gas gave rise to the most unsatisfactory medical feature of the war. In spite of the German signature to The Hague Convention article condemning the use of gas, the Germans proceeded to employ this mode of attack and found the Allies and the medical departments unprepared for it. At first heavy gases containing mainly bromine were used, favoring winds carrying them. Later gas hand grenades were employed. These gases had an intensely irritant effect and produced suffocation or were followed by severe purulent bronchitis. Pulmonary edema often proved fatal. Gas masks overcame this mode of attack. When long range gas shells were employed, sometimes with delayed action, so as to lull against precautions. At times, shells containing "sneezing" or "vomiting" gases were used for the displacement of masks. In July 1917, at Ypres, "mustard gas," now known to be chemically dichlordiethylsulphid, was employed. It was persistent and would hang about for hours and make dugouts perilous for days. It burned the skin, and clothes moistened with it produced escharotic effects. Many of the most important German advances were made by means of these gases as a preliminary. The Allies learned to neutralize and reply effectively to all of them.

When the gas was not concentrated enough to produce suffocation or set up fatal pulmonary edema, the men usually recovered, though many of them went through a period of awful discomfort which was, of course, the reason why the use of gas was forbidden at The Hague. Comparatively few of those who survived presented serious lung lesions, though they had to be treated by the open air method, as for tuberculosis, as much as possible. We have learned from tuberculosis how tolerant the lungs are of even severe pathological conditions and how readily, after a time, compensation is secured. The question whether gassing predisposes to tuberculosis has been settled in the negative, though undoubtedly in certain cases latent foci of tuberculosis were made active by the process.

Comparative mortalities from wounds and disease in modern war show what a great gain was made by surgery and sanitary science in the war. In the Russian campaign against Turkey in 1828, some 80,000 died of disease and about 20,000 of wounds. In General Scott's campaign in Mexico the deaths from disease were over 33 per cent of the effective strength. In the Crimean War, out of a total force of 300,900, the French lost by disease 75,000 and by wounds 20,000. In the Prussian war against Austria, of but seven week's duration, the losses by disease were 6,427 and by wounds 4,450 in an army of 437,000. In the Spanish-American War 2,565 deaths were from disease and 345 deaths from wounds, in an army of 274,717. In the South African War the deaths from disease were 69 per thousand strength; from wounds, 42 per thousand. In the Russo-Japanese War the deaths from disease were 41.8 per thousand strength and from wounds 72.9 per thousand strength, the ratio for the first time reversed. Out of 300,000 dead in the Civil War, in the armies of the North over 200,000 were from disease. In the Confederate armies, of 200,000 deaths, three-fourths were estimated as due to disease and one-fourth to the casualties. (Figures furnished by the United States Surgeon-General's Office).

According to the 'Medical and Surgical History of the Rebellion' (Medical volume, part 1, pages xxv and xxvi), there were in the Northern armies altogether 235,583 gunshot wounds with a resulting mortality of 33,653 or 14.2 per cent. These figures represent the total returns from about nine-tenths of the mean strength of the Union army and exclusive of the injuries of those killed in action. In the World War, the deaths from wounds, that is of all those who came to the surgeons alive, no matter how badly wounded, were less than 5 per cent. In view of the large numbers of poison gas casualties, the proportion of fatal cases was very low, being no more than about 3 per cent. This of course does not include the permanently blind. The serious infections with tetanus and the gas bacillus at the beginning of the war make the available statistics much worse than would otherwise be the case. With the control of these the mortality among the wounded in the closing phase of the war was probably below 3 per cent.

The health of army camps at the beginning of the war was most satisfactory. As Dec-

tors Vaughan and Palmer said in their article on "Communicable Diseases in the National Guard and National Army of the United States" (*Journal of Laboratory and Clinical Medicine,* August 1918), "Preventive medicine has made it possible to prevent half a million cases of disease and save the lives of ten thousand soldiers," and they give the figures from the Civil War and the World War for corresponding six months to show the truth of this. The improvement has affected every form of infectious disease. There has been only about one-tenth as much mouth and throat inflammation, less than one twenty-fifth as much intestinal trouble, not one-hundredth as much fever. Malaria, which even in the Northern army was extremely common, has now become a negligible morbidity factor and the mortality from tuberculosis and pneumonia is more than cut in two.

The sad epidemic of influenza proved that it was not the general hygienic conditions that brought improvement but the specific sanitary precautions against particular diseases. Unprepared for influenza in this virulent form, it raged very seriously, while the well-known camp diseases were kept entirely under control.

Typhoid or enteric fever which has played such a fatal part in all previous wars, carrying off in the Spanish-American War more than five times as many as the bullets of the enemy and in the Boer War causing ever so much more havoc among the British than the Boers did, had almost no place in the late war. The reason was better sanitation and careful provision of uncontaminated water with the guarding of latrines from flies and other insects that might find their way afterward to food, but above all, the typhoid immunity of the armies was due to typhoid vaccination, that is the inoculation of the soldiers with cultures of typhoid germs prepared under conditions that produced immunizing results. There is no doubt at all that this is the genuine source of the great saving of life that was effected. The inoculations cause almost no disturbance of the general health,—soldiers have gone into battle the same day,—and only rarely have any serious effect. It is evident that in civil life travelers in distant countries or to parts of the country of whose sanitation they are not sure, will take such vaccinations against typhoid as a protective.

Trench fever was an affection peculiar to the great war and replacing typhoid fever somewhat in its ravages among the soldiers. The men came down rather suddenly with a considerable degree of temperature lasting for from three to seven days, gradually disappearing and causing a great deal of prostration. After some days of normal or sub-normal temperature, the fever occurs again and the relapsing character of the affection has been quite marked. Careful investigation has shown that the disease was distributed through the body lice which proved such a pest to the soldiers under the very difficult conditions as regards cleanliness to which they were subjected. The discovery made possible the prevention of the spread of the disease to a great extent, while the segregation of the relapsing and chronic cases in camps by themselves under favorable conditions of health brought about such a reaction as enabled the patients to throw off the disease. The study of trench fever, its etiology and its successful treatment as well as prevention, was one of the triumphs of the war.

The great medical surprise of the war was the development of a large number of cases of a very severe form of functional nervous disease. Men lost control of themselves completely, very often had disturbances of the special senses,—deafness was rather common, blindness not so frequent,—and sensory disturbances of other kinds, with mutism and tremor or paralyses of various kinds, were noted. At first a great many of the cases were set down as forms of insanity and the patients were sent to insane asylums, but after careful study the purely neurotic character of the affection was determined. The cases were called "shell shock" and unfortunately, early in the war were grouped under this term, besides the neurotic cases, a number of latent injuries to the central nervous system, as from actual wounds by minute particles of shells at high velocity, severe concussions and the like. It was thought for a time that the intense compression of the air with immediate release near an exploding shell caused air at high pressure to be given off from the blood, leading to rupture of capillary arteries of the central system or other definite physical lesions resembling those of caisson disease. The prompt and complete recovery of many serious cases under proper treatment contradicted this theory and made it clear that there must be no organic basis. The term shell shock was suggestive of something much more than a psycho-neurosis, which the affection really was, and the term *nervousness,* the word sick or wounded in parentheses being added to the diagnosis "according to the external conditions to which the man was exposed at the time of breakdown," was suggested for it. This would have been a much better term but the original name maintained itself, as so often happens. The condition was entirely due to an emotional storm with loss of control over nerves, and nothing else. Its importance will be readily appreciated from the fact that during the first half of the war, one-seventh of all the discharges from the British army, or one-third of the discharges if those from wounds were not included, were for "shell shock." It was four times as prevalent among officers as among men. Cowardice was excluded as the basis and there was no malingering, except in cases readily recognizable. The study of the affection has thrown great light on the psycho-neuroses of civil life and above all has been valuable in the matter of treatment.

These patients need special treatment in special hospitals. In ordinary military hospitals, surrounded by sufferers from actual physical conditions, they are the subject of unfavorable suggestion and little incentive to get well. They must not be kept under circumstances, either at home or in hospital, where much sympathy is afforded them and their stories must not be listened to sympathetically, for they have the tendency of all neurotics to assimilate as their own, experiences gleaned from various sources. The first requisite of successful treatment is a careful examination which determines absolutely that no organic morbid condition is present. Then the patient must be given the feeling that his case is of no special signifi-

cance, but, on the contrary, is well understood and above all, has nothing exceptional in it. He must be made to understand that just as soon as the attending physician has the time to give to him, he will be able to remove his symptoms without delay. Three principles are insisted on in the methods of treatment. (1) suggestion, (2) re-education, (3) discipline. The aim of suggestion is to make the patient believe firmly that he will be cured and then after treatment that he is cured to stay so. Re-education overcomes the bad habit of lack of confidence that has been formed and discipline breaks down the psychic-resistance of the patient to the idea of recovery. For such symptoms as mutism or deafness, the patient is told that electricity will cure him and that as soon as he feels the current when the electrode is applied, his power of speech or hearing will be restored *pari passu,* with sensation. The same method is used for blindness and other sensory symptoms. Paralyses are favorably affected the same way, though tremors are harder to deal with. A cure in a single treatment is the best method, for the patient readily relapses unless he has been made to feel that he has recovered his powers completely and that it would be his own fault to permit his symptoms to recur. The cases partake of the nature of hysteria, though typical hysterical symptoms, crying, the making of curious noises, hysterical convulsions, are rarely seen at the front. The experience has made it clear that rest is nearly always an abuse in the treatment of such cases and inveterates the symptoms. The physical condition must be improved but the state of mind must be changed completely at once, if cure is to be effected.

A very interesting development of the treatment of these affections among the French, who had large experience, requiring over 20,000 places in their hospitals for the cases, was with regard to the value of severe discipline. In refractory cases, patients were put in solitary confinement without reading or writing materials or tobacco. This changed the mental attitude and helped to make counter-suggestion effective. In certain cases, strong Faradic currents were used which caused severe pain, so that patients who were mute had to scream out and those who could not use muscles were compelled to move them. Once it became known that treatment of this kind was being used, symptoms were much less persistent. The reason why the neuroses in officers were more difficult of treatment was that these measures were seldom employed on them. It became clear that the infliction of pain on a neurotic patient up to the point where he yields up his pathological suggestion is effective therapeutics. Some older severe methods of dealing with these cases which were condemned in our milder day are now justified by war discipline.

The surgical feature for which the late war was noted is the definite reconstruction work for the wounded which was organized for the first time in history. Not only artificial limbs and helpful apparatus of various kinds were provided, but the crippled were trained to do the work they are particularly suited for in their maimed condition. It was found that some 95 per cent of those who lost an arm or hand could go back to their old occupations, while a very large proportion of those who lost a leg could be trained to bench trades or given clerical or similar occupations which made them thoroughly independent of assistance. Even with the loss of both legs, a man can be self-supporting. Indeed, the care exercised in training the crippled resulted in a great many cases in giving them a better occupation in life than they had before. The temper of this aid has been such as to give men a hearty spirit of courage in facing life, so that they do not feel their handicap as an incubus, but on the contrary, are ready to do their bit in civil life as well as they did in war. The idea that they are crippled is not allowed to overcome them and the old custom of having begging cripples after the war is not to be allowed. Even the blind and the deaf are made self-supporting and at the same time given such occupation of mind as keeps them from being depressed. The effect of example on the part of some of the more courageous proved a wonderful stimulus, so that though the war left many maimed men, it did not tend to create many helpless and the spirit of helpfulness does not provide useless sympathy and paralyzing charity, but just such encouragement as enables the men to help themselves.

Chronic affections of various kinds which developed as a consequence of the war were treated by the same far-seeing after-treatment that was given to the maimed. In a word, the soldier taken in health was either dismissed, after thorough examination, in as good health as before,—or usually much better,—or else he was given the advantage of scientific thoughtfulness and pre-vision in regard to his case, so as to restore him just as far as possible to his former usefulness as a member of the community. In the years following the war these phases of rehabilitation received the closest attention from medical authorities in the former belligerent countries.

JAMES J. WALSH, M.D.,
Author of 'The Thirteenth Greatest of Centuries.'

MEDICI, mĕd'ē-chē or mā'dē-chē, a Florentine family who rose to wealth through commerce, became prominent in the affairs of the state, gained supreme power and were in general known as patrons of literature and art. GIOVANNI (1360–1429) rendered important service to Florence and became gonfalonier in 1421. His son, COSMO, the Elder (1389–1464), was called "Pater Patriæ," gained vast wealth, was a munificent patron of art and letters and combined statecraft with commercial enterprise. He was for 34 years the sole arbitrator of the republic and the adviser of the sovereign houses

of Italy. His grandson, LORENZO THE MAGNIFICENT (1449–92) governed the state in conjunction with his brother GIULIANO (1453–78) till the latter was assassinated by the Pazzi, a rival Florentine family. Escaping from this massacre he conducted a war with Ferdinand of Naples, with whom he signed a definitive peace in 1480. The rest of Lorenzo's reign was passed in peace and in those acts of profuse liberality and magnificent patronage of arts and sciences, in which he rivaled or excelled his grandfather. He left three sons — PIETRO (1471–1503), GIOVANNI (afterward Pope Leo X), and GIULIANO, Duke of Nemours. Pietro succeeded his father, but was deprived of his estates when the French invaded Italy in 1494. He finished his career in the service of France. His eldest son Lorenzo came to power by the abdication of his uncle Giuliano, who became Duke of Urbino. He died in 1519, leaving a daughter, the famous Catharine de' Medici (q.v.), queen of France. After several reverses in the family, Alessandro, an illegitimate son of the last-named Lorenzo, was restored to Florence by the troops of Charles V, and by an imperial decree was declared head of the republic, and afterward Duke of Florence. The next name of importance in the family is that of COSMO "the Great" (1519–74), in 1537 proclaimed Duke of Florence and afterward Grand Duke of Tuscany. A learned man himself, he was a great patron of learning and art, a collector of paintings and antiquities. FRANCISCO MARIA I, his son, obtained from the Emperor Maximilian II, whose daughter Joanna he had married, the confirmation of his title of grand duke in 1575, which continued in his family until it became extinct in 1737 on the death of Giovanni Gasto, who was succeeded by Francis, Duke of Lorraine. MARIE DE MÉDICIS (q.v.) (1573–1642), queen of France, was daughter of Francisco I. See FLORENCE; ITALY — HISTORY; LEO X, and consult Armstrong, Edward, 'Lorenzo de' Medici' (London 1896); 'Cambridge Modern History' (Vols. I and II, New York 1903–04); Fabroni, Angelo, 'Magni Cosmi Medicei Vita' (Pisa 1789); Heyck, Eduard, 'Die Mediceer' (Bielefeld 1897); Hyett, F. A., 'Florence' (London 1903); Horsburgh, E. L. S., 'Lorenzo the Magnificent' (London 1908); Meltzing, Otto, 'Das Bankhaus der Medici und seine Vorläufer' (Jena 1906); Roscoe, W., 'Life of Leo X' (5th ed., London 1846); id., 'Life of Lorenzo de' Medici' (10th ed., 1872); Ross, Janet, 'Lives of the Early Medici' (London 1910); Vaughan, H. M., 'Medici Popes, Leo X and Clement VII'; Brinton, 'Golden Age of the Medicis' (1927).

MEDICI, Banks of the. The opulent house of Medici owed its origin, like that of the scarcely less wealthy house of Fuggers (q.v.), to the profits of the woolens trade, the progenitors of both houses having been weavers and dyers of woolen cloths, in their time the principal constituent of European garments; the cultivation of cotton and manufacture of cotton cloths being as yet monopolized by the Saracens. Schoenhof informs us that in 1422 Florence (under the Medici) had more than 70 banks, which by the year 1472 were merged or consolidated into 33. So important were these institutions to the Florentine republic, that they earned the sobriquet of the "Fifth Estate." The Medici had 16 banking houses in different European cities. (*Journal American Bankers Association*, September 1916). In the 15th century one of the Medicis was appointed treasurer to the Papal See; in the 16th century one of the Fuggers held the same high office. It is an interesting circumstance that the former became a Platonist, while the latter joined the Reformation. Lorenzo de Medici's appointment as treasurer was made by Sixtus IV in 1471; Huldric Fugger's, by Paul III about 1549. Both of these popes afterward assailed their appointees; but the banks they controlled and the important trades they financed rendered them too powerful to be easily overthrown. The Medicean banks received deposits of money for safekeeping, loaned the same out upon collateral, discounted commercial paper, issued bills of exchange, and traded in foreign coins and bullion. They possessed mints in Florence, Urbino, Barile, Pezza and other places, in which they struck their own coins, the series beginning in 1204, upon the fall of the Greek Empire, the dates in the old calendar being 10 years earlier. These coinages enabled the Medicean banks to make highly profitable exchanges of old coins and bullion at the various emporia in Europe and Asia which were brought within the circle of their commercial influence. Their earliest gold coin (the Florin) was struck in 1252, the series being issued by the gonfalionere (Standard-bearers) of the Republic of Florence until 1533, when they were struck by the Medici as dukes of Florence, afterward as dukes of Etruria. Maintained at their full legal weight (56 English grains, fine gold) the florins continued to be current in all the ports of Europe for centuries, their only rivals being the sequins or ducats of Venice. For the history of other ancient banks. See BARCELONA, BANK OF; BYZANTIUM, BANK OF; FUGGERS, BANK OF THE; GENOA, BANK OF; TYRE, BANK OF; VENICE, BANK OF.

MEDICINE, American Academy of. See AMERICAN ACADEMY OF MEDICINE.

MEDICINE, Eclectic, embodies the principles and practice of the only established American school of medicine. The term Eclectic was not the most fortunate, for at no time has it adequately defined the school's position. When chosen, the term was very popular and was borne by several education systems and books, and was moreover well known to the laity. The name American School of Medicine, as proposed by Dr. A. H. Baldridge, one of its pioneers, would have been more expressive, would have avoided misunderstandings and would have saved the school much criticism regarding its position among the existing systems of medicine. Eclecticism is the direct successor of the American Reformed System of Medicine originated by Dr. Wooster Beach of New York City in 1825. It should not be confounded with Thomsonism (Thomsonianism), or the doctrines of the steam and herb doctors, promulgated and practised in the early part of the 19th century by Samuel Thomson of New Hampshire, the peculiar theories of which the Eclectic school never adopted; the majority of the followers of Thomson being among their most bitter antagonists. In later years, however, many of the Thomsonians joined the Eclectic school and creditably assisted in up-

uilding it. The most successful organizer of ie Eclectic school was Dr. Thomas Vaughan Iorrow of Kentucky. The investigations in iedical botany and materia medica by Schoepf, Benjamin Smith Barton, W. C. P. Barton, Constantine Rafinesque, William Tully and thers gave an impetus to the movement which esulted in the establishment of the new school. 'he Reformed School of Medicine, by which ame what was later denominated Eclecticism as first known, was organized in opposition to ie drastic practice of the dominant school of iedicine,— bleeding, blistering, and the abuse f the salts of mercury and antimony,— against hich Eclectics, as well as the followers of homson and Hahnemann, protested. Instead f these barbarous remedies the reformer ought to substitute milder measures and to nploy vegetable medicines whenever possible. et, in the light of the present the substituted ractice of the early reformers would be re- arded as but little less barbaric than that which ley sought to supplant. The basis of Eclectic hilosophy was the sustenance of the vital orces, the avoidance of depleting remedies, and ie selection, as with the ancient Eclectics, of ie best of remedies and means from all ources, even despising not the primitive medi- ines of the untutored American Indians. They id not rest contented, however, with merely selecting the best"; they endeavored to im- rove on such selections. To the reformer the ractice of the dominant school was cruel and nhuman, the remedies barbaric. Out of the ommon stock of remedies he chose those best uited to his purpose in what he believed to e a more humane practice. He looked for- ard to certain ideals and objects not in accord ith the views and practice of the dominant chool. For his presumption in thus opposing ie authorities in medicine and by inaugurating nwelcome innovations he was branded an regular; was ostracised by the self-styled egular physicians. An outcast, he was thus orced to organize a school in accord with his ieories and practice.

There are three epochs in the history of Ec- ctic medicine,— the period of reformed medi- ne, from 1825 to 1845; the formative period, rom 1845 to 1869, which was largely concerned organization, and study of plant remedies; id the period of specific medication, from 869 to the present, in which the best work of e school has been accomplished, and during hich the theory of specific medication was romulgated and has been most largely prac- ed.

The educational history of Eclecticism dates om 1825, when Dr. Beach privately instructed udents at his clinic in New York, where, in 27, he established an Infirmary, which in 29, he expanded into the Reformed Medical cademy. In 1830 it assumed the more digni- d title of the Reformed Medical College of e City of New York. It was well equipped d continued in operation until about 1838. extbooks of a high order were prepared by . Beach. A national society was formed and om this body an expansion movement was gun by the selection, in 1830, of Dr. John J. eele as an agent to proceed westward and plore the towns on the Ohio River with a w to selecting an eligible site for a branch the New York College. A circular of the society having reached Worthington, Ohio, Col. James Kilbourne, president of Worthington College, invited the promoters to establish their school in that town. Dr. Steele accepted and Drs. Thomas Vaughan Morrow and Ichabod Gibson Jones were sent to perfect the organization. The Reformed Medical Department of Worthington College, as this school was called, entered upon a successful career in 1830, with Dr. Morrow as the leading spirit, but lack of proper facilities, the machinations of enemies, internal dissensions, and the financial crisis of 1837 caused it to be suspended in 1842. Dr. Morrow next removed to Cincinnati, Ohio, and assisted by Drs. Lorenzo Elbridge Jones and Alexander Holmes Baldridge, at once organized the Reformed Medical School of Cincinnati. In 1845 this college was chartered by the State of Ohio as the Eclectic Medical Institute. From this time the term *Eclectic* has been employed to designate the system and its physicians.

The formative period of Eclecticism began with the chartering of the Eclectic Medical Institute in 1845 and ended with the introduction of specific medication in 1869. During this period large classes attended the Institute. *The Western Medical Reformer,* begun in Worthington in 1836 and suspended in 1838, was now revived and published as the *Eclectic Medical Journal.* Barring a brief half year suspension this periodical has continued to be published to the present time. In this period, Dr. John King, justly styled the father of modern materia medica, began the publication of his numerous textbooks, among which the 'American Dispensatory' gave the school an enduring and monumental work on materia medica. The pharmacy of the school advanced from crude drugs in powder, infusion and decoction past the resinoid and alkaloid distraction to improved galenicals. In this connection be it recorded that Professor King discovered and introduced the resins of podophyllum and macrotys, which together with the alkaloids of hydrastis and sanguinaria, were afterward prepared by Dr. William Stanley Merrell. These valuable agents together with the oleoresins of iris and capsicum attracted the attention of pharmacists. A host of indefinite compounds was added by others and the market was flooded with what purported to be Eclectic resinoids or concentrations. This heterogeneous class of pharmacals was denounced by Professor King and others who had sought to introduce only elegant and definite compounds. This much abused class of resinoids served, however, a temporarily useful purpose in the evolution of a more perfect materia medica. Of these preparations, only those made after the methods of Dr. King, and the alkaloids of hydrastis and sanguinaria have survived and singularly are now mostly employed by practitioners of the dominant school. During this period Eclectic colleges were established at Rochester and Syracuse, Louisville, Philadelphia, New York and Cincinnati. The majority of these were short lived and some of them had a strong leaning toward the system of botanic medicine now represented by the physio-medicalist. The Eclectic Medical College of Pennsylvania for many years in good repute, finally drifted away and during the later years (since 1871) was neither recognized by Eclecticism nor others. In 1856, a portion of the faculty of the Eclectic Medical Institute formed a rival college in Cin-

cinnati which had a large following. This school was absorbed by the Institute in 1859. The Civil War seriously threatened the educational progress of the cause and the withdrawal of a large quota of Southern students caused a marked shrinkage in the attendance at the Northern schools. Times were hard and the outlook gloomy. Dr. John Milton Scudder, a graduate of the Eclectic Medical Institute in 1856, now became the head of that institution. By strict business management he inaugurated a period of renaissance and Eclecticism soon became a recognized force in medicine in America. Specific medication, introduced by Dr. John M. Scudder in 1869, though at first vigorously opposed, is at present the basis of practice of fully three-fourths of the Eclectic physicians and is the leading therapeutic doctrine taught in all the Eclectic colleges. In fact modern Eclecticism is the practice of specific medication. Its theory is as follows:—Disease is a wrong or impairment of life. It is manifested clinically by certain well-defined symptoms. The totality of symptoms express a condition, to which, in the usual nosological classification, a special name is given. This disease name is of value only in the study of the natural history of diseases, for statistical data, for the purpose of recognizing contagious and infectious diseases, and for establishing a prognosis, certain necessarily fatal diseases allowing only of palliative treatment. The specific medicationist, like practitioners of other schools, pursues such a method of nosological diagnosis for the purposes named, but not as a guide to treatment, in which to him it is of little or no value. For therapeutic purposes he reverses this process and studies his case by analysis, not by synthesis, to discover, if possible, the varying conditions which make up the disease, as evidenced by specific and well-defined symptoms revealing disease expressions. Remedies have a certain force, and are definite in action. Like effects follow like causes. Hence, having found, by repeated experimentation, the opposing action of a drug in a certain condition of disease, as expressed by certain specific symptoms, objective or subjective, the same remedy will always relieve or cure like abnormal conditions. The believer in specific medication holds that there is a fixed relationship between drug force and disease expression.

The Eclectic has no specifics for *diseases* but specific remedies for specific conditions of such diseases. Specific diagnosis implies diagnosis to discover the condition curable by a certain remedy, as established by previous experimentation, and specific medication means the application of the known remedy for the pathological condition so found. Specific diagnosis is therapeutic, not nosological diagnosis. In practice the specific medicationist is guided in the selection of his remedy by "specific indications," as illustrated by the few following examples: The strong, excited, bounding pulse indicates veratrum viride; sharp, cutting or lancinating pain in serous tissues, bryonia; the full, oppressed pulse with a sensation of præcordial fulness and dyspnœa, lobelia; marked periodicity, with moist tongue, open pulse and freedom from nervous excitement, quinine; cadaverous odor of the secretions, potassium chlorate, etc.

The modern Eclectic recognizes no law of cure, and does not accept a remedy as a specific until the extended successful employment of it in some particular condition has given it the right to be so called. Empiricism and experimentation are the foundations of knowledge concerning each remedy denominated a specific medicine. The havoc wrought Eclectic pharmacy at the close of the formative period had now to be remedied. The school had been nearly shipwrecked on the shoals of commercial selfishness, as seen in the instance of the resinoids. Calamities often bring about future good, so in this instance the commercial mistakes of a few gave a renewed impetus to better the conditions of Eclectic pharmacy. Uncertain preparations were supplanted by definite medicines. As a result the school has now a materia medica and system of therapeutics much sought by the descendants of those who endeavored to block the efforts of the pioneer Eclectic, in his zealous contention for pure and representative medicines. Dr. Scudder, supported by Dr. King and others, advocated office pharmacy as a step toward a better knowledge of drugs and to secure definite remedies. Special attention was given green and freshly dried products. Formulas were published for the preparation of specific medicines. Finally, in order to secure the integrity of these medicines and protect them from conscienceless manufacturers, Dr. Scudder copyrighted the labels. These bore the title "Specific Medicines" and gave the specific indications for their use. The manufacture of medicines bearing these labels was entrusted to competent pharmacists and from that time the school has been free from objectionable pharmacy. Dr. Scudder advocated the use of specific medicines in the study of the relationship of medicine to disease expressions. The Eclectic of the formative period selected from other schools, but endeavored to improve. He substituted milder for harsher methods; he opposed the use of the lancet and blister, and the abuse of mercury and antimony salts. The modern American Eclectic advocates the use of kindly curative remedies, and the avoidance of depressing or depletive medication. He has been the pioneer in the study of the indigenous materia medica, with special reference to specific indications and specific uses of medicines employed. He contends for the best possible pharmacy so that the minimum amount of medicine may accomplish maximum results. Harmful medication as exemplified in excessive drugging he has consistently opposed, heroic over-drugging having been one of the most potent causes leading to the necessity for the establishment of an Eclectic school. He advocates liberality of thought, the highest medical education, the cultivation of professional dignity, and the ethics that govern gentlemen.

The position of the Eclectic school of medicine is now well established, and the attitude of malice and persecution formerly shown it by rival schools is fast becoming a memory. The two colleges had 253 Eclectic students in 1926. For a period of about 10 years this numerical relation has remained nearly stationary, but because of better facilities for teaching, enlarged literature, and harmony in the ranks of the school it has never occupied so favorable a position nor had a better outlook for the future than it has to-day. Never before in its history has it been so free from internecine bickerings, attacks by rival schools, and unpleasant entangle-

ments and alliances. It challenges all ages in the wealth and completeness of its materia medica. Recognizing the merit of the work accomplished the regular profession in many localities now invites Eclectics to join its associations providing they drop their distinctive title. This the Eclectic is unwilling to do, believing that the school has earned the right to be regarded and recognized as a distinct set in medicine. Its work in the special fields of materia medica and specific diagnosis and specific medication entitle it to this right. The Eclectic school has a strong national organization and numerous State and local societies. A national reform association was founded in 1829, and a second at Worthington, Ohio, in 1836. In 1848 the first National Eclectic Medical Association was organized in Cincinnati, Ohio, with Dr. T. V. Morrow as president, and it held annual sessions until 1858. The present National Eclectic Medical Association was organized at Chicago, Ill., in 1870, with Dr. John W. Johnson, of Connecticut, as president. It holds annual sessions, meeting in various cities throughout the United States. Eclectic practioners now hold positions as examiners in the more important life insurance companies, and are not now debarred from the army and navy medical service as in the earlier days of medical ostracism. No discrimination is now made against them as surgeons for the great railway systems. These recognitions have been earned in the face of vigorous medical opposition, by the consistent and honorable course pursued by the Eclectic school as a whole. The Eclectic Medical College of Cincinnati, Ohio, the parent school of medical Eclecticism, and the Middlesex College of Medicine, Cambridge, Mass., are the leading colleges of this American system of medicine.

HARVEY WICKES FELTER, M.D.,
Late Professor of Materia Medica and Therapeutics, Eclectic Medical College, Cincinnati, Ohio.

MEDICINE, History of. As far as we can determine or surmise disease has existed since there was life on earth. There was a time when this earth consisted only of inanimate matter. It is quite certain that death began almost simultaneously with the beginning of life. Disease in one form or another must have begun almost as soon. It may be that the earliest form of disease was metabolic, merely a manifestation of the wear and tear of the living organism. Soon perhaps, in addition to these changes associated with senescence, abnormal changes commenced to develop in certain subdivisions of living matter, changes which altered definitely the character of these subdivisions, and which were not the simple changes resultant on ageing.

It is characteristic of what we understand as life that the constituents which make it up are in a state of constant activity, the component elements breaking down and being replaced by additional elements derived from without. The process of building extraneous inanimate material into living tissue has come to be known as anabolism while the breaking down, or disintegration of the living structure has been called katabolism. The whole process, the simultaneous building up and breaking down constantly going on is termed metabolism.

Metabolism, the process of living, can continue only as long as there is available material for repair and for growth, for reproduction and the other functions commonly identified with life. In remote periods, before life had been so far differentiated as to be recognizable in the forms which we now see, all nourishment, all materials for the anabolic processes were without doubt derived from inanimate, inorganic matter. With the progress of evolution, however, the time arrived when, with both living and dead matter surrounding a living structure, the latter developed a capacity for utilizing both the inorganic and the organic substances for its own purpose of living. And thus living matter, or living tissue, developed the capability of obtaining sustenance from other living organisms. This condition, one body living at the expense of another living body, has been termed parasitism. And thus by degrees parasitic diseases have developed. In the animal and vegetable kingdoms parasitic disease takes many forms, the commonest being so called infectious disease.

Infectious disease or parasitic disease no doubt commenced early in the stages of evolution. Today the human body may be invaded by small microscopic living structures known as bacteria which derive their sustenance from and live at the expense of their host. The earliest forms of life were similar simply organized microscopic bodies. But even at an early stage it now appears probable that these so-called unicellular micro-organisms suffered from parasitic disease. Only within the past few years has experimental work suggested that bacteria which cause infectious disease in man, themselves suffer from parasitic disease, such that they may be destroyed entirely by some even more minute forms of living matter multiplying at their expense.

And so, long before man appeared upon the earth, living matter suffered from one form or another of most of the disease types known today.

As soon as man had developed sufficient intelligence to distinguish ageing from metabolic disease, from parasitic infection, in short the occurrence of a diseased state, to interpret and describe pain and the other symptoms characteristic of disease, and to wish to relieve himself or his neighbor of this abnormal state, the practice of medicine in its crudest form took its beginning.

Among the earliest savages, as indeed among the savages of today, disease was customarily looked upon as of supernatural origin, the work of an unfriendly demon or a form of punishment inflicted by an angry god. Disease was ascribed to special demons of disease, the machinations of departed spirits or of ghosts, the activities of slain animals, to human enemies possessed of supernatural powers and the capability of casting spells, or to the wrath or vengeance of one of the tribal gods.

Attempts to rid the body of disease consisted therefore in making sacrifices calculated to propitiate the offended deity, or of doing penance for one's sins even to the point of actual personal torture, self inflicted or inflicted by others, or by seeking the intervention of other more friendly spiritual forces in behalf of the victim. If the disease resulted from invasion of the body by unfriendly demons, the proper treatment lay in making the body as unpleasant an abode as possible for the devils.

This was accomplished by starving, beating or otherwise torturing the victim, by giving emetics to cause vomiting, etc. Again, the evil genii might at times be enticed from their new abode by the offering of a more pleasant dwelling. Thus the demon of yellow jaundice might be lured into the body of a canary bird.

And so we see the medicine man of the savages steeped in spiritualism, employing grotesque ritual in the treatment of his victims, oftentimes causing more serious harm than the ravages of the disease which he had been attempting to cure.

The belief in a supernatural origin for disease, arising in the savage's terror of the incomprehensible, persisted far into historical times and we see it still manifested in the mythology and theology of the Greeks and Romans. Indeed, even in the Christian religion, particularly in the early centuries of our era, we repeatedly observe evidence of belief in the origin of disease as an act of divine retribution coupled with the idea of relief therefrom through propitiation of the omnipotent wrath.

The earliest individual physician known in history was Sekhet'-enanch, an Egyptian who lived about 3000 B. C. From a study of records in Egyptian tombs we learn of the existence even in his day of the lancet and of an instrument for cupping. The earliest operation known is that of trephining of the skull, a procedure which even today is serious and difficult. This was performed to provide portals of escape for demons such as the demon of headache. We learn from the Ebers Papyrus, written about 1500 B. C., that pills, potions, inunctions, inhalations and plasters were all used at that time. The value of the poppy for soothing crying infants was recognized. On the other hand, ignorance and superstition were still strongly active. Thus «against all kinds of witchcraft, a large beetle, cut off his head and wings, boil him, put him in oil and apply to the part. Then cook his head and wings, put them in serpent's fat, warm it, let the patient drink it.»

Early advance in the knowledge and practice of medicine was slow and intermittent and our records thereof are most fragmentary. The ancient Hindus of India progressed to a degree truly remarkable for their epoch, both in their knowledge of medicine and particularly in the art of surgery. Most of our information of these ancients is derived from the Vedas or «Books of Wisdom,» the fourth of which, written around 700 B. C., gives us the major portion of our information. As early as this, new noses were created from cheek and forehead flaps, supraorbital nerves were sectioned for neuralgia, and laparotomy was discussed. In medicine also, remarkable strides were made, particularly in army sanitation, and the establishment of hospitals and of asylums for the blind and the lame.

True medicine had its origin in the early Greek civilization. The Greeks of three and four hundred years before Christ worshipped many gods and demigods. A different god or goddess for every phase of their existence. Among these was Asklepios, (more commonly called by his Roman name, Aesculapius), the god of medicine. To the temples of Aesculapius went all who might, of those who were diseased, there to regain if possible their former health. This was accomplished by prayer, by sacrifice or through other methods of imploring divine intervention. Customarily, while sleeping before the altar of Aesculapius one would receive in a dream the knowledge necessary to recover health.

The Greeks were primarily thinkers or ponderers. Their activities and writings express a natural stage in the evolution of the developing intellect, with its desire to know the why and wherefore of all things. With few or no instruments with which to carry out accurate studies or investigations in any of the lines now known commonly as science, such as physics, mathematics, medicine, etc., they could but recognize the existence of certain phenomena, reflect upon them, reason as to their possible causes, and theorize as to their modes of action. This was but to philosophize and the ancient Greeks became the greatest of all philosophers. They had developed the attributes of inquisitiveness and were searching to know the why and the wherefore of all things with which they came into physical or mental contact.

It was at this time that the temples of Aesculapius had reached the pinnacle of their prominence and the priests and others associated with the work of the temples were searching to know more of the phenomena of disease.

What an opportunity for the study of disease, in these localities where the sick from the civilized world were aggregated! And what a paucity of instruments wherewith to make conclusive investigations! No stethoscope, no thermometer, no methods for examination of the urine, no laboratory facilities whatsoever. Nothing beyond the five senses, —sight, hearing, taste, smell and touch, but reinforced with a truly remarkable insight and judgment and unusual interpretive faculties.

From past experience the priests soon recognized the types of illness with greatest promise of relief through the intervention of Aesculapius and they selected only these from among the thousands seeking admittance into the temples. Consequently the percentage of cures was many times higher than had they allowed all to enter, and the fame of the temples spread. Likewise did their wealth increase for it was the custom, with health regained, to leave large votive offerings to the benign deity.

But as the reputation for healing spread, even more visited the temples and more were perforce turned away. Many of these, too ill to return or lacking sufficient funds, were obliged to remain in the neighborhood and were cared for by lay workers. These latter termed Asclepiadæ were not infrequently men of unusual brilliance. They, above all others, possessed a tremendous opportunity for the speculative study of the symptoms and course of disease.

The temples of Aesculapius and the neighboring buildings where the less fortunate sick were attended became veritable huge sanatoria in which hygiene and hygienic principles were rigorously enforced. The importance of diet, of baths and of various forms of mental and physical recreation was fully recognized. The Asclepiadæ were as a rule on excellent terms with the priests in the temple and had no difficulty in following their cases whether they re-

MEDICINE, HISTORY OF

Right: Hippocrates (460?–?377 B.C.), Greek physician, known as the "father of medicine," visiting a patient in Athens.

Center: Claude Bernard (1813–1878), a French physiologist who studied problems of digestion.

nained under their care or passed on into the emple. The opportunity was enormous.

The fortunes of the world were materially dvanced when in 460 B. C. Hippocrates, the son nd grandson of physicians, was born. As one f the Asclepiadæ he was trained from early outh in the profession of medicine. One of he keenest observers of all time, Hippocrates vas at the same time an able philosopher. He vrote prolifically and with such clear under-tanding of the symptoms of disease that in his vritings and those of his pupils we recognize nany of the diseases as they are diagnosed oday. While the existence of various maladies vas recognized long before the time of Hip-ocrates, he in particular stressed the impor-ance of differentiating disease entities by a tudy of their symptoms. The greatest Hip-ocratic contribution to medicine and that which bove all others justly allows him the title of 'ather of Medicine was his successful attempt o divorce the phenomena of disease from su-erstition and the idea of supernatural forces. Ie preached that disease is the result of natural auses which must be searched out and con-idered in a most critical spirit until all sources f error are eliminated as far as possible. For-unately also he founded a school of medicine vhere the principles which he was evolving vere put into practice. These were, (a) the bjective investigation of disease, (b) the study f etiology or cause, and (c) an insistence upon ie value of expectant treatment, combined with iild therapeutic measures.

Pre-Hippocratic medicine, steeped in tradi-on and based to a great extent upon idolatry, ad little foundation of fact upon which to uild a rational system of treatment. How ould one prescribe the proper remedy in any athologic condition when practically nothing as known of the anatomy or physiology of the uman body? One must have an understanding f the makeup and mechanism of the machinery hich one is attempting to repair to keep it unning smoothly. Before, and indeed through e Greek civilization, little was known of natomy save those facts discovered by the riests in their dissections of sacrificial animals. ven here the dissections were of a most super-ial character. The organs of sacrificial ani-als were studied for good or evil omens. The ver, because of its size, was considered of un-ual importance. From its examination the urse of future events was predicted. Among e Babylonians hepatoscopy was practiced as rly as 3000 B. C. If the gall bladder were und to be swollen on the right side, it in-cated let us say, an increase in the strength the king's army and was a favorable omen. long bile duct pointed to a long life even as a ngthy line in the palm of the hand today is nsidered by the superstitious as indicative of ngevity.

Hippocrates upset the old tradition, divorced, part at least, the practice of medicine from eological superstition and paved the way ward rational study of the human body. His ritings and those of his followers were soon read over much of the known world and be-me the standard for professional conduct. ippocrates lived in the golden age of Pericles, great epoch of ancient Greece. Not long er his death the beacon of learning in Greece rned low, and the centre of civilization was transferred to Alexandria in Egypt where Ptolemy, one of Alexander's generals, founded a great museum and centre of investigation and teaching. He brought together minds of the times in the various branches of science and philosophy. Here, for the first time, extensive dissections of the human body were carried out and although the interpretations of the findings were more often erroneous than not, some progress was made toward a clearer understanding of anatomy and physiology.

With the growth of the Roman Empire, we observe a new light shining forth in the history of medicine,—Galen, the greatest of the Roman physicians and the greatest physician since Hippocrates. He was born in 130 A. D., of Greek parentage. He was a keen observer, an experimenter and at the same time a philosopher. He was the fashionable physician of his time and, it is interesting to note, collected good fees. It has been stated that he received the equivalent of $2,000 for a fortnight's attendance upon the wife of a prominent Roman.

Galen's greatest contribution was in the study of anatomy and physiology. He had studied anatomy in Alexandria and was thereby well grounded. Most of his investigations were made on apes and pigs. His most valuable permanent contribution was in osteology, or the study of bones. His description of the bones of the body would not require great change to be accurate today.

Galen's hypotheses of physiology, or the working of the various organs, were based on close and careful observation, but his interpretations were usually incorrect. When we realize that the writings of Galen completely dominated the practice of medicine for the next thirteen centuries we may understand how, with erroneous conceptions of the functions of the various organs, scientific progress was slow. It was not until hundreds of years later, when men arose who dared dispute the teachings of Galen, that real progress in medicine recommenced. Prior to Galen's time it had been understood that the arteries were air-containing. It was from this that the name was derived. Galen knew of the valves of the heart and determined the direction of flow of the blood as it entered and left the organ, but he did not appreciate that it was a pump for distributing the blood, regarding it rather as a furnace from which the innate heat of the body was derived. He determined definitely that blood was present in the arteries and veins but he considered it to be of two different types and did not recognize that the blood circulates through a closed system including arteries, veins and capillaries.

During his time we find various schools of medical thought of which three were dominant. The first school considered of greatest importance the discovery of the cause of disease and its removal. The sole interest of the second was with the disease and not with the condition from which it arose. The last group selected their remedies only on the basis of past experience, using what had previously been found in similar conditions to be beneficial, paying little or no attention to the mechanism by which the results were obtained. In the treatment of disease at this time extracts of roots and herbs and similar preparations had a great vogue.

The development and spread of Christianity was a distinct deterrent to scientific progress. With the advent of the conception that existence on this earth is of importance only as a preparation for the world to come, the evanescent problems of our life were greatly ignored. It was not so much that science was taboo as that in view of the teachings of Christianity science was superfluous. «Does your skin roughen without baths? Who is once washed in the blood of Christ need not wash again.»

From the death of Galen, about 200 A. D., up to 1542 the high water mark of the Renaissance, or rebirth, medicine was dominated by his teachings and, except in isolated localities, practically no progress was made. This was the period of which we speak as «The Dark Ages.» Fortunately in three regions of the civilized world, the light was kept burning, albeit dimly. Southern Italy and Sicily has always been more Greek than Roman and in this environment the school of Salernum became the centre of medical studies. The school flourished throughout this time and made some permanent contributions to the progress of medicine.

With the separation of the Roman Empire into the Western and the Eastern Empires, the latter, with its centre at Constantinople less influenced by the Christian doctrine, kept alive the Greek medical tradition. Byzantine medical science gradually decayed, however, and by 1453, when Constantinople fell to the Moslem invaders, the few Greek scholars who remained were dispersed and with them went many precious manuscripts.

But the most important path through which the early Greek knowledge, the knowledge of Hippocrates and of Galen and their contemporaries, was kept alive was through the Arabian infidels.

As the Arab hordes swept from Arabia across northern Africa conquering all in their path and finally subjugating parts of southern Europe, particularly Spain, their appetite for knowledge grew and they gathered to them the great scholars of the times, founding famous centres of learning.

«The world has but once witnessed so marvelous a spectacle as that presented by the Arabs in the 9th century. This pastoral people, whose fanaticism had suddenly made them masters of half of the world, having once founded their empire, immediately set themselves to acquire knowledge of the sciences which alone was lacking to their greatness. Of all the invaders who competed for the last remains of the Roman Empire they alone pursued such studies. While the Germanic hordes, glorying in their brutality and ignorance, took a thousand years to re-unite the broken chain of tradition, the Arabs accomplished this in less than a century. They provoked the competition of the conquered Christians—a healthy competition which secured the harmony of the races.

«At the end of the 8th century, their whole scientific possessions consisted of a translation of one medical treatise and some books on alchemy. Before the 9th century had run to its close, the Arabs were in possession of all the science of the Greeks; they had produced from their own ranks students of the first order and had raised among their initiators men who, without them, would have been groping in the dark; and they showed from this time an aptitude for the exact sciences which was lacking in their instructors whom they henceforward surpassed.»

One in particular stands out during the Arabian domination, Avicenna, the «Prince of physicians,» the rival indeed of Galen, among the great names of medicine. Born about 980 A. D. he became a prolific writer, and was the author of the most famous medical textbook ever written. It was called the 'Canon,' and was followed so blindly that it came to be looked upon as infallible. It was indeed the physician's bible.

Arabian medicine made no noteworthy contributions to anatomy or to physiology since dissections were not permitted, but certain new and important diseases were described and a number of valuable remedies were produced, derived chiefly from the vegetable kingdom. The Arabian hospitals were unusually well constructed and organized. Valuable contributions were made in the study of chemistry and chemical substances were introduced in the treatment of disease.

During the Renaissance, with the resurrection of desire for knowledge in Christian countries, medicine and other sciences were reclaimed from the Arabs chiefly through the Crusaders returning from the Holy Land and from the Arabian cultural centres in Spain.

In the 13th century great universities arose throughout Europe, many being associated more or less closely with the monasteries. Two men stand out as the torch bearers of the period, stirring others to a study of the phenomena of nature and of life. These were Albertus Magnus and Roger Bacon whose «chief merit is that he was one of the first to point the way to original research as opposed to the acceptance of authority—though he himself still lacked the means of pursuing this path consistently.» His teachings were a protest against the acceptance of the ancient tenets of Galen.

The dawn of medical Renaissance will always be associated with the name of one concerning whom contemporary and modern opinions have been at great variance. Paracelsus, called by many the prince of quacks, the greatest of charlatans, hailed by others as one of the greatest physicians. A true medical revolutionary, he was bombastic in his utterances and iconoclastic in his teachings. His fierce attacks upon the medical attitudes of the day brought him into trouble wherever he would go. With the established Church also he was *persona non grata*. Space does not permit a discussion of the interesting though erroneous teachings of Paracelsus. His contribution to the progress of medicine was in the realm of chemistry. Up to his time chief interest of the alchemists had been the discovery of the elixir of life, the secret of perpetual youth and the finding of some means by which gold might be made from the baser metals. Paracelsus' interest in chemistry on the other hand was based on his hope that many chemical substances might be found which would have definite value in the treatment of disease. He established the use of mercury in medicine, and recognized the value of other chemical principles. Paracelsus died in 1541.

The following year saw the publication of wo epoch-making books in the history of cience. First, Copernicus, the great astrono- ner, demonstrated conclusively the existence of he solar system and the fact that the earth evolves about the sun. Second, Vesalius pub- ished his remarkable work on anatomy. From he death of Galen until 1542 our knowledge of natomy had made but little progress.

Vesalius, a Belgian, was made professor f anatomy and surgery in the great University f Padua when he was but 25 years of age. Ie was a tremendous student and a dominant ersonality. Men from the remotest parts of Europe attended his anatomical dissections and ectures. Within three years he had collected nough material and had accumulated sufficient rawings of anatomical figures to place his ook in the hands of the printer.

Vesalius is the true founder of modern natomy. His anatomy is with few exceptions he anatomy of today. His writings, daring to uestion the authority of Galen, were received ith scorn and abuse. Although he had en- husiastic friends, the majority were against im. He was a prolific writer and had volumi- ous and valuable manuscrips not yet published. Thoroughly disgusted with the attitude of his ellow practitioners, in a fit of anger, he threw hem all into the fire and gave up forever the tudy of anatomy. But his anatomy lives today nd Vesalius will go down through the years s one of the great lights in medical history. Not until 1542 did medicine have a correct con- eption or understanding of the anatomy of the uman body.

In Padua, about 1600, we find a young nglish student, William Harvey, studying un- er one of the successors of Vesalius. Harvey's istruction in anatomy was the best of the eriod. Remember that although anatomy had ade distinct progress the physiology was still at of Galen. The vascular system was still nderstood to contain two kinds of blood, the eavy thick blood in the veins, which carried ourishment from the liver to all parts of the ody, and the lighter blood containing the vital pirit which pulsated back and forth from the eart as the tide will ebb and flow, distributing ital heat and life to all parts of the body. he lungs fanned and cooled this vital blood cting as a bellows.

Harvey had studied the veins carefully at adua and had observed, as had his teacher, e presence of small valves in the veins. This ecluded the possibility of back flow in these ssels and further studies of the valves of the art suggested to Harvey the possibility that e blood might circulate from the heart rough the arteries into the veins and back ain to the heart. By ingenious experiment arvey proved the correctness of his theory nd in 1628 published a small book in which he scribed his experiments and conclusions. his was the beginning of the science of ex- rimental medicine. So great was the value nd significance of Harvey's contributions, not one to medicine, that his book can be found day in Dr. Eliot's collection of the greatest ritings, the «Harvard Classics.»

The establishment of the circulation of the ood was a small fact indeed when compared th the rest of our knowledge of physiology day, but it completely upset the only pre- existing physiology, that of Galen. It was the beginning of modern physiology and from the time of Harvey to the present, knowledge of the workings of the human body progressed by leaps and bounds. All is not yet known but that which is known has been learned through experimental medicine rather than through mere conjecture.

By the middle of the seventeenth century we find medicine in the possession of accurate knowledge of anatomy and ever increasing knowledge of the true physiology of the human body. Now for the first time begins a study of the anatomical results of disease. Vesalius and many of his contemporaries had recognized abnormal conditions of organs at necropsy, but they had not followed these patients through life and had paid little attention to the abnormalities. The establishment of modern pathology awaited a group of practicing physicians, one of the earliest and most notable of whom was Morgagni, who attended their patients making careful physical examinations and examined them after death, searching explanations for the abnormalities found during life.

Now the science, study and practice of medicine progressed rapidly. Pathology, the anatomical study of the results of disease, brought a much clearer perception of the nature of disease and enabled investigators to differentiate the types thereof. Among the leaders of the time we must pause to mention John Hunter, one of the greatest clinicians of his period, a man who combined the qualities of Vesalius, Harvey and Morgagni and who did more than all others before him to place treatment on a scientific basis. We are accustomed to divide the treatment of diseases into two epochs. That from the time of Galen to Hunter, and the second from the time of Hunter onward. Hunter marks the severance of the last link of the chain which bound physicians blindly to the teachings of Galen.

In 1819 Lænnec devised the stethoscope thereby beginning the day of physical examination in diagnosis. Richard Bright, in 1836, had studied the urine of diseased individuals and examined their kidneys at autopsy and had been able to demonstrate disease of these organs in individuals with albuminuria. Since then nephritis has been termed both popularly and in medical practice, Bright's disease.

In 1796 Jenner, a country physician, had successfully protected individuals against smallpox by inoculation with the virus of cowpox. The significance of this discovery may be understood when we realize that at his time few individuals reached adult life without being marked with the dread disease. His work was revolutionary, but there was not even a beginning of understanding of the mechanism whereby the immunization was accomplished until fully sixty years later when Louis Pasteur, a young French chemist, began his work upon fermentation. This led to his study of the fermentative diseases of wines and beer and his discovery that they were due to minute living organisms. The microscope had been invented about 1590. Pasteur's work led to his conception of animal disease as due to similar microscopic viruses. There followed his invaluable work in eliminating disease in silk worms, then his successful immunization of animals against anthrax and of man against hydrophobia.

In 1876 Robert Koch a physician practising in a small town in Germany, founded the science of bacteriology. His discovery of the bacillus of tuberculosis revolutionized our methods of treatment of this disease. In 1867 Joseph Lister, an English surgeon, first applied Pasteur's and Koch's theories of the bacterial causation of disease to the prevention of wound infection during surgical operations. Previous to his time practically all surgical wounds had been infected and many had died from resulting septicemia. Lister's work in antiseptic surgery later was supplanted by modern aseptic surgery.

Can we conceive the pain and suffering of a serious surgical operation performed without anesthetic? Consider for a moment the tremendous boon to humanity in the discovery of the anesthetic properties of ether, first publicly established in Boston in 1846.

Morgagni, the founder of gross pathology, was followed around the middle of the 19th century by Virchow, who transferred our conception of the seat of disease from the microscopic organ affected to the microscopic cell or unit of that organ.

During the second half of the 19th century continued advances in the study of the glands of internal secretion led to new conceptions of certain types of diseases and opened the way to the cure of certain previously incurable maladies.

Medicine of the last quarter of the 19th century was dominated by the knowledge of structural pathology, by the observations of men of the type of Morgagni and Virchow. Their chief interest was in the character and extent of the anatomical damage in the various organs. Most of the knowledge acquired was at autopsy and showed the *results* of disease. Study of these characteristic and terminal changes, many of which showed little promise of being altered by therapeutic means even during life, tended toward decreasing confidence in the efficacy of various procedures in treatment.

Among the many advances in the knowledge during the first quarter of the twentieth century that in the study of *functional* pathology has been perhaps the most helpful.

Since the advent of biochemical methods, we can now study in the clinical laboratory, the reaction of the various tissues of the living body to certain test reagents or can analyze accurately the chemical products of metabolism from different organs as found in the blood, urine or elsewhere.

Take for example the kidneys. During the dominance of structural pathology we studied the urine for evidence of kidney disease and, finding albumin and casts to be present, could state that the kidneys were affected. How serious was the extent of the damage we could only surmise. Indeed it was not until after the patient's death that we were able at autopsy to obtain a clear picture of the condition of the diseased organ.

Now, we may determine the secretory capacity of the kidney with the phenolsulphonephthalein and other tests, determine its ability to excrete solids with the two-hour renal test, learn concerning its ability to excrete water by the performance of a water excretion test, and through a study of the blood or even of the saliva we may gain accurate knowledge as to whether substances which should be excreted by the kidneys are being dammed back into the blood stream. We can learn not only whether changes exist in these various features of kidney function but we may know at the same time how extensive are these changes. In other words we are in a position to study and to know quite accurately the functional capacity of the kidneys while the patient is still alive and can therefore more intelligently direct the treatment.

Progress in the knowledge and treatment of disease has indeed gone far. Far from the incantations of the savages, from polypharmacy of the middle-ages when each root and herb had some curative function, God-given and begging for recognition. We have indeed gone far from that time when under the dominance of the «doctrine of signature» it was believed that the All-Powerful had indicated by a sign which plant should be used for each ailment;—the liverwort for liver disease because of a superficial resemblance of its leaf to the human liver; flowers with red centres for inflammation of the throat, and the like.

For a time after the worthlessness of great numbers of remedies had been demonstrated and when under the sway of structural pathology it appeared useless to attempt to alter by a simple medication such extensive and permanent changes as were discovered post mortem, medical leaders were inclined toward the doctrine of «therapeutic nihilism.» No medical treatment could be of great value in the face of the picture presented post mortem, but useless drugs and procedures having been weeded out, there remained a not inconsiderable number of remedies of proven value. Without them and their intelligent use the sufferings of humanity would be increased many fold.

And now, having established the correct value of most drugs, and ruled out those of doubtful worth, medical science is constantly adding remedies which have been tested experimentally and been proven efficacious though harmless. New discoveries in hygiene and nutrition, in bacteriology, chemistry, immunology, allergy, endocrinology, surgery, pharmacology, and roentgenology are gradually being added to our therapeutic armamentarium. Not a year elapses but we see added at least one discovery of permanent value and it is safe to say that every decade one or two discoveries of the first order, such as smallpox vaccine, diphtheria antitoxin, rabies vaccine, thyroid extract, insulin, salvarsan, enriches our knowledge and brings further boon to humanity.

MEDICINE, Preventive. See PREVENTIVE MEDICINE.

MEDICINE, Progress in. The advance of medical science takes place by no means at a uniform rate. In addition to the many new and sometimes startling discoveries in hitherto unexplored fields, any account of its progress should also include a survey of improvements in medical techniques, new and practical information concerning epidemiology and preventive medicine, and recent changes in statistics of the common diseases in which the morbidity and mortality of man are seriously concerned. This article evaluates published matter of importance in 1950, particularly in the newer fields of medical science as distinguished from surgery. In addition to these reports concerning new discoveries, some of the older fields are reviewed in the light of added knowledge, in order that a proper perspective may be attained. Merely to regard a particular disease as a finished matter, if we know no more of its origin and course than was known a decade ago, is to close our eyes to the fact that the results of treatment may now be infinitely more satisfactory than in former years. For practical reasons the period embracing the last decade (1940–1950) has been chosen as a guide for the presentation of what, in the opinion of the writer, are the more notable advances in medicine. References in the text are to sections within this article and to subjects presented elsewhere in THE ENCYCLOPEDIA AMERICANA.

Adrenal Cortical Hormone.—There is hardly a field of medicine in which more significant research has been conducted than in the study of the principles present in the adrenal cortex. Numerous methods have been employed in its extraction, the object being to isolate the hormone in pure crystalline form in order that its later synthesis may become possible. The commonest procedure is by the use of lipide solvents. For this purpose ether, ethylalcohol, acetone, and benzene have been used. In any method chosen it is necessary to remove every trace of adrenalin, which is a principle of the adrenal medulla. Up to 1950 a great variety of compounds had been isolated and the end is apparently not in sight. Perhaps the most important and interesting of these, from a practical standpoint in future therapy, is Compound E now referred to as cortisone. This substance was isolated by Edward C. Kendall (1886–) and Philip S. Hench (1896–). See section on *Endocrine Therapy*. See also separate article ENDOCRINE GLANDS.

Anesthesia.—In the last decade anesthesia has occupied a prominent place in medicine and a number of new procedures and techniques have been adopted. Anesthesia now includes: (1) preoperative sedation; (2) inhalation anesthesia such agents as ethyl ether, chloroform, ethyl chloride, cyclopropane, nitrous oxide, ethylene, and divinyl ether; (3) regional anesthesia by such agents as novocain, spinal anesthesia, and procaudal anesthesia; (4) intravenous anesthesia. It is concerned largely with surgical procedures. See also separate article ANESTHESIA.

Antibacterials.—Antibacterials are agents which destroy or hinder the growth of bacteria. An antibacterial may be physical or chemical in action. The most important of the antibacterial drugs developed in recent years are the sulfonamides, sometimes called the sulfa drugs.

Sulfanilamide is known also under various trade names. This drug exerts a powerful antibacterial action against streptococci, meningococci, and gonococci. Ordinarily it is given by mouth in 0.1 gram doses per kilogram of body weight. It is successful in active cases of disease and also in prevention.

Sulfadiazine causes fewer toxic reactions than sulfanilamide and is used in the same type of infections.

Sulfapyridine is effective in the same diseases and is used also in colonic infections and dysenteries.

Sulfathiazole is employed largely in pneumonias and infections of the urinary tract. See also SULFA DRUGS.

Antibiotics.—These are agents which tend to destroy life. The term antibiotic is applied specifically to extracts of certain organisms used in combating infectious disease caused by other organisms.

Penicillin, the commonest and best-known example, has been called the greatest therapeutic agent yet discovered. It is produced in small quantities by the mold *Penicillium notatum* when grown in culture, using suitable media. The chemical nature of penicillin is unknown and as yet it has not been produced synthetically. It should be borne in mind that there are several penicillins, at least seven salts having been identified. Of these only the sodium and the calcium are of clinical importance. The drug is effective against several forms of pneumonia, scarlet fever, tonsillitis, gonorrhea, and those diseases caused by spirochetes. It does not harm human tissue. In acute infections of the middle ear it has been of the greatest value, almost banishing the once common sequel, mastoid disease. Moreover, the drug is a valued adjunct to effective surgery, preventing severe infections in lacerating injuries as well as checking incipient or imminent peritonitis, where, without it, serious infection would seem bound to occur. In some cases of probable clinical benefit the satisfactory results reported have been aided by the administration of antibacterial drugs combined with the use of penicillin. The dosage of penicillin must be calculated in units (Oxford unit). This may vary from 50,000 to 200,000 units, or even more, per day. Ampoules of penicillin contain, usually, 100,000 Oxford units prepared for deep injection into a muscle.

Streptomycin is a water soluble antibiotic obtained from *Streptomyces griseus.* It is active especially against Gram-negative organisms, including the bacterium of tuberculosis. It is even more effective than penicillin in the pneumonias and in gonorrhea and will resolve dysentery and whooping cough.

Chloromycetin, a new antibiotic, has been used with reported good results in the rickettsial diseases, such as typhus fever, spotted fever, and virus pneumonia.

Aureomycin has been somewhat disappointing in its action against tuberculosis.

Other and perhaps similar antibiotics have come into limited use, but their effectiveness is yet to be demonstrated. Up to 1950 the causes of the virus diseases, poliomyelitis, influenza, and measles are found to be uninfluenced by any antibiotic. The same is true of the common cold, despite individual and scattered reports to the contrary. See section on *Colds.*

Aviation Medicine.—Since the creation of an

independent air force in the organization for the national defense of the United States, many changes have occurred in the United States Air Force. There are now three directorates in the organizational scheme. These are: (1) Directorate of Professional Service, embracing an aviation medicine division, a physical standards division, and a clinical medicine and preventive medicine divison. Each of the latter is subdivided further into a number of technical branches which include every department of medicine and health. (2) Directorate of Staffing and Education, embracing a management division and a professional education division, subdivided further into branches having to do with procurement, classification, medical education, and medical training. (3) Directorate of Plans and Hospitalization, embracing a medical service plans division, a hospital division, a medical matériel division, a resource and analysis division, a medical personnel division, and a diometrics division. The air force maintains a school of aviation medicine, aeromedical laboratory, and an Arctic aeromedical laboratory.

Blood.—Studies of the blood have resulted in much greater accuracy in diagnosis of many ailments and in more effective means of treatment. Blood transfusions have become routine everywhere and even in small and isolated communities it is possible for acute emergencies to be handled without the necessity—with added risk—of transporting the patient a great distance to a large city hospital. This is of course only possible where facilities for storing whole blood exist. The view of Karl Landsteiner (1868–1943) on incompatibility, as indicated by isoagglutination following transfusions of whole blood, has been amply confirmed. As a rule, not much difficulty is encountered in finding suitable donors, since group O (universal) are considered safe for recipients of all blood groups. Universal recipients of all blood groups (groups A and B) may receive blood from any group (O, A, B). Prior to 1914, the use of blood transfusions was uncertain because of technical difficulties and the absence of lists of donors other than those interested in selling their blood. About 1928 a nonprofit donor bureau was organized and some 10 years later the blood bank was established. Since 1940 the blood bank has become a recognized institution throughout the United States and is now an important function of the Red Cross, both national and state. Blood chemistry has been greatly broadened and developed. In many physical surveys the nonprotein nitrogen constituents, urea nitrogen, uric acid, creatinine, and blood sugar are determined in a laboratory before the survey is regarded as complete. Examinations of the blood also include the determination of the inorganic constituents, as calcium, chloride, iron, magnesium, phosphorus, potassium, and sodium. The sedimentation rate, clotting power, and examination of the blood cells often lead to confirmation of a suspected diagnosis or to a diagnosis as yet unsuspected. See also separate article BLOOD.

Curare.—This drug is of variable and uncertain composition and is prepared from *Chondodendron tomentosum*. It was known formerly only as an arrow poison used by the natives of South America and in physiological laboratories. It is of current medical interest owing to its action in paralyzing the skeletal muscles by blocking the neuromuscular junction, so that nerve impulses are no longer transmitted. It is likely to produce respiratory paralysis. The drug is used to control convulsions and muscular spasms in certain nervous disorders, notably epilepsy.

Encephalography.—This is a procedure in which the cerebrospinal fluid is replaced by a gas passed through a needle introduced into the spinal canal, in order to visualize by X-rays the ventricular system, the base of the brain, and the subarachnoid pathways. This procedure has been shown to be of increasing value in determining whether a particular brain lesion is amenable to surgical treatment. With its wide use a large number of brain tumors are disclosed and many of these are found to be subjects for radical removal. As a diagnostic aid in brain lesions these tests are invaluable.

Endocrine Therapy and Endocrine Preparations.—Due to the fact that there are now produced a great number of chemically pure and physiologically active hormones, some important advances in hormone therapy have taken place within recent years. The basic principle of such therapy is, of course, to correct a deficiency in the endocrine system. The endocrine glands are so intimately related that a state of hyperfunction or hypofunction in one part will affect the entire endocrine system.

The production of chemically synthetized hormones has made hormone therapy of the first importance. Among the important synthetic preparations may be listed the following: (1) adrenal gland preparations, of which about eight are cortical hormones used in such conditions as Addison's disease, hypopituitarism, surgical shock, hyperthyroidism, and Simmonds' disease; (2) about eight adrenal medullary preparations used in edema, asthma, allergies, rhinitis, angioneurotic edema, hay fever, local anesthesia, and hemorrhage; (3) ovarian hormones (estrogenic), approximately 20 preparations, used in deficiencies of the female reproductive system, such as dysmenorrhea, vaginitis, menopausal conditions, acne, amenorrhea vomiting in pregnancy, sterility; (4) approximately 10 preparations of corpus luteum used in functional uterine bleeding, habitual abortion, and dysmenorrhea.

Fever Therapy.—The subject of production and use of fever therapy by physical agents for therapeutic purposes continues to be of great interest. The most important methods in use employ air-conditioned cabinets, since the application of electric blankets has been largely discontinued. The various types of apparatus for production of radiant heat have been improved greatly, and hyperpyrexia is now produced by humidified, heated air passing over the body rather than by direct application of radiant heat to the skin surfaces. Body temperature can be controlled better and more accurately by a diathermy cabinet. Careful selection of patients should be made and generally it is conceded that persons with hypertension, cardiac disease, and general debility should not be accepted for treatment. In general, a person who is a poor risk for surgical operation is not a good risk for fever therapy. This method of treatment has been recommended in some 50 diseases, but its most marked success, according to late reports, has been in chorea, gonorrhea, neuritis, and syphilis of the nervous system. In the opinion of some who have had the most experience in this form of medical treatment, it should be confined to the treatment of gonorrhea and its complications, where the disease is resistant to chemical therapy

to syphilis, when it is combined with chemical treatment, to chorea, and to undulant fever.

Hormone Therapy.—See section on *Endocrine Therapy.*

Immunity; Immunology.—Immunity is defined, in simple terms, as a condition of a living person (organism) by which it resists an infection or overcomes it, if infection has occurred. Some organisms possess a natural or active immunity either as a result of an infection hitherto unrecognized, or as produced by immunization with bacteria or with the products of their growth. Passive immunity can be produced by the injections of antibodies prepared in animals or in other human beings. Immunity in regard to the so-called virus diseases is not easily explained. A number of the virus diseases exhibit a type of parasitism, and it is probable that immunity is acquired, because the parasite does not find, in all cases, appropriate living conditions in some hosts. In the case of animals, some are resistant to inoculations of viruses which can be cultivated, while others easily develop the disease. Almost without exception an animal or a human being that has recovered from a virus infection possesses a lasting immunity to reinfection from outside sources. In this respect these infections are vastly different from those resulting from the majority of bacterial diseases. The fact itself poses the interesting question as to the possibility of obtaining a lasting immunity for any human being through inoculations of inactivated virus. In past years many authorities have held that lasting protection is possible only if an active virus is used, even though it has been so completely attenuated that the virus can no longer be demonstrated. The matter appears to be still unsettled in 1950. The entire field is still virgin soil, and many technical procedures, such as new methods of filtration, dialysis, diffusion, and tissue culture, will doubtless be developed in the near future. And this development in turn will prepare the way for important discoveries among the many riddles of immunity. See also section *Viruses and Virus Diseases.*

Pediatrics.—Since 1945 infant (first year of life) mortality has been lowest in the large cities of the United States. In 1943 the rate per 1,000 in cities of 10,000 or over was 36.1. In rural communities it was from 45 to 50 per 1,000, while in some urban communities the rate was only 25 per 1,000. Contributing factors to the lowered mortality were better water, wider use of pasteurized milk, and the efforts of infant welfare services in particular areas.
